The chemical accident prevention provisions, codified in 40 CFR 68, are federal regulations designed to prevent the release of hazardous materials in the event of an accident and minimize potential impacts if a release does occur. Portions of 40 CFR 68 are incorporated by reference in OAR 340-244-0230. Oregon regulations reference the federal list of substances and threshold quantities for determining applicability to stationary sources. If a stationary source stores, handles, or processes one or more substances on this list in a quantity equal to or greater than specified in the regulation, the facility must prepare and submit a *Risk Management Plan* (RMP). If a facility does not have a listed substance on site, or the quantity of a listed substance is below the applicability threshold, the facility does not have to prepare an RMP. In the latter case, the facility still must comply with requirements of the general duty provisions in section 112(r)(1) of the 1990 CAAA if there is any regulated substance or other extremely hazardous substance on site.

Stationary sources are defined in 40 CFR 68 as any buildings, structures, equipment, installations, or substance-emitting stationary activities belonging to the same industrial group, located on one or more contiguous properties, under the control of the same person (or persons under common control), and from which an accidental release may occur. However, the federal definition also states that the term “stationary source” does not apply to transportation, including storage incidental to transportation, of any regulated substance or any other extremely hazardous substance. The term “transportation” includes transportation subject to oversight or regulation under 49 CFR 192, 193, or 195 or a state natural gas or hazardous liquid program for which the state has in effect a certification to DOT under 49 USC § 60105. Based on federal definitions excluding transportation and storage incidental to transportation, an RMP is not required for this facility based on federal regulations.

State Air Quality Requirements

Oregon Construction Permit

Oregon requires each facility that will be subject to the Oregon Title V permit program to obtain a permit to construct before beginning to construct, install, establish, develop, or operate any air contaminant source (OAR 340-216). To meet this requirement, NorthernStar initially submitted an application to the ODEQ in April 2006 for an Air Contaminant Discharge Permit (ACDP) addressing both construction and operation of the LNG terminal. The ODEQ requested that NorthernStar obtain site specific meteorological data and use the data to refine their air dispersion modeling results. NorthernStar provided this information in March 2007 and supplemental information in April 2007. The ODEQ determined that the application was incomplete because it did not include a Land Use Compatibility Statement. The ODEQ stated that it would work informally on the permit application while NorthernStar works to resolve land use issues with Clatsop County.

Oregon Title V Permit

As mentioned previously, the Bradwood Landing LNG terminal's projected potential emissions would trigger Oregon Title V permit requirements (OAR 340-218). NorthernStar would obtain a Title V permit before commencing operations and would pay Title V operating permit fees (OAR 340-220).

Plant Site Emission Limits

Facilities that require Oregon Title V permits and/or an ACDP must obtain plant site emission limits (PSEL) for all regulated pollutants (OAR 340-222-0020). These PSELs are incorporated into the facility's Title V permit and/or ACDP. For pollutants whose potential to emit exceeds significant emission rates (SER), the proposed LNG terminal would likely receive site-specific PSELs set equal to the facility's potential to emit. Table 4.10.1-9 shows the projected potential to emit for criteria pollutants. Based on this information, the proposed terminal would be likely to receive source-specific PSELs for CO and NO_x. Generic PSELs equal to the relevant SERs would likely be set for PM₁₀, SO₂, and VOCs, as well as other pollutants.

TABLE 4.10.1-9		
Significant Emission Rates and Terminal Potential to Emit		
Pollutant	Significant Emission Rate (tpy)	Potential to Emit (tpy)
CO	100	199.6
NO _x	40	122.6
PM ₁₀	15	13.4
SO ₂	40	0.2
VOCs	40	24.5

Air Quality Impact Analysis

Under Oregon regulations in OAR 340-222-0041(3)(C), an Air Quality Impact Analysis (AQIA) is required for any criteria pollutant that exceeds the SER threshold. NO_x, which will be modeled as NO₂, and CO emissions would exceed the SER and would be included in the air quality analysis.

Dispersion modeling methods would estimate the maximum off-site ambient concentrations for project emissions that exceed the SER. The maximum off-site concentrations would then be compared to the following Oregon SILs:

- CO: 2,000 µg/m³ based on a 1-hour average and 500 µg/m³ based on an 8-hour average; and
- NO_x: 1 µg/m³ based on an annual average.

For pollutants with maximum off-site ambient concentrations less than the applicable SIL, no further impact assessment would be required and compliance with NAAQS is demonstrated. If impacts are significant, a more refined analysis would be required to demonstrate compliance with NAAQS. The refined analysis must show that total modeled impacts plus total competing NAAQS source impacts plus general back concentrations would be less than the NAAQS for all averaging times.

The ODEQ mandated that NorthernStar model the impact associated with operational emissions from the stationary sources, as well as emissions from LNG carriers (see section 4.10.1.1). Due to the lack of representative ambient air quality data, the ODEQ requested that NorthernStar collect

meteorological data for one year at the site of the proposed terminal. This data collection was completed in February 2007 and NorthernStar conducted air dispersion modeling using the site-specific meteorological data. Results of the modeling analysis are documented in a March 22, 2007 Air Quality Modeling Report to the ODEQ.

The analysis included a review of the proposed terminal emissions. Based on the review, CO and NO_x were required to be modeled for comparison to applicable air quality standards. The modeling analysis was conducted using the American Meteorological Society/Environmental Protection Agency Regulatory Model Improvement Committee (AERMIC) modeling program (AERMOD), version 07026, with PRIME downwash algorithms, processed site-specific meteorological data, and USGS digital elevation model terrain data. NorthernStar requested and obtained from the ODEQ competing source information, which was included in the impacts analysis, along with appropriate background concentrations.

The terminal sources of CO and NO_x were modeled to determine if predicted impacts would exceed the SILs. The maximum modeled off-site concentrations were predicted to exceed the 8-hour CO and annual NO_x SILs and to be below the 1-hour CO SIL. As a result, background concentrations were added to the maximum modeled concentrations from the terminal plus the competing sources for comparison to the CO and NO_x AAQS. Table 4.10.1-10 documents the results of the AAQS compliance demonstration and shows that emissions from the terminal are expected to be below the NAAQS and OAAQS.

TABLE 4.10.1-10						
AAQS Dispersion Modeling Results Summary (Terminal)						
Pollutant	Averaging Period	Terminal +Competing Source Modeled Concentration (µg/m ³)	Background Concentration ^a (µg/m ³)	Total Impact (µg/m ³)	AAQS (µg/m ³)	Standard Exceeded (Yes/No)
CO	1-hr	1,721	2,000	3,721	40,000	No
	8-hr	544	1,400	1,944	10,000	No
NO ₂	Annual	21.6 ^b	15	36.6	100	No

^a Background concentrations provided by Mark Bailey of the ODEQ.

^b Annual NO_x results reduced by Ozone Limiting default factor of 0.75 to estimate equivalent NO₂ concentration.

The modeled project impacts were also evaluated for compliance with the applicable PSD increment thresholds. There are no PSD increments for CO. The NO₂ PSD increment is 25 µg/m³. As required, the terminal plus the competing source modeled concentrations were compared to the increment. Since the modeled concentration of 21.6 µg/m³ was below the applicable increment, no further analysis was required.

A prior modeling analysis conducted by NorthernStar dated July 13, 2006 documented the results of modeling the LNG carrier emissions, while hotelling, from the on-board electrical generator. The modeling was conducted using AERMOD with local meteorological data, since the site specific meteorological data was not yet available. The analysis included an assessment of the proposed CO, NO₂, PM₁₀, and SO₂ emissions for comparison to the applicable AAQS and increments. Table 4.10.1-11 below documents the results of the analysis. It should be noted that the estimated emission rates from the LNG carriers listed in tables 4.10.1-4 and 4.10.1-5 have been updated and are lower than those used for the modeling analysis conducted in July 2006. As a result, the impacts presented in table 4.10.1-11 are conservative. The estimated impacts are below the NAAQS and OAAQS; therefore, we do not expect significant air quality impacts.

TABLE 4.10.1-11						
AAQS Dispersion Modeling Results Summary (Terminal and LNG Carrier)						
Pollutant	Averaging Period	LNG Carrier Modeled Concentration ($\mu\text{g}/\text{m}^3$)	Background Concentration ^a ($\mu\text{g}/\text{m}^3$)	Total Impact ^b ($\mu\text{g}/\text{m}^3$)	AAQS ($\mu\text{g}/\text{m}^3$)	Standard Exceeded (Yes/No)
CO	1-hr	96.2	2,000	3,721	40,000	No
	8-hr	17.5	1,400	1,944	10,000	No
NO ₂	Annual	0.75 ^c	15	37.4	100	No
PM ₁₀	24-hr	1.24	30	31.2	150	No
	Annual	0.02	15	15.0	50	No
SO ₂	3-hr	501.21	65	566.2	1300	No
	24-hr	83.2	30	113.2	365	No
	Annual	0.98	15	16.0	80	No
^a Background concentrations provided by Mark Bailey of the ODEQ. ^b Total Impacts listed for CO and NO ₂ include modeled concentrations from the LNG carriers, terminal plus competing sources (from table 4.10.1-10), and background. Total impacts listed for PM ₁₀ and SO ₂ include modeled concentrations from the LNG carrier and background only since the emissions from the terminal of those pollutants do not exceed the ODEQ's Air Quality Impact Analysis (AQIA) thresholds and did not require an analysis. ^c Annual NO _x results reduced by Ozone Limiting default factor of 0.75 to estimate equivalent NO ₂ concentration.						

Since the project would be located within 200 kilometers of a federal Class I area, modeling was also conducted to demonstrate compliance with the Class I area NO₂ increment of 2.5 $\mu\text{g}/\text{m}^3$. Table 4.10.1-12 presents the modeled annual average NO₂ concentrations for comparison to the significance level.

TABLE 4.10.1-12					
Class I Area Dispersion Modeling Results Summary (Terminal)					
Area Name	State	Distance/ Direction from Terminal (km)	Terminal Modeled Concentration ^a ($\mu\text{g}/\text{m}^3$)	Class I Area Significance Level ($\mu\text{g}/\text{m}^3$)	Significance Level Exceeded (Yes/No)
Columbia River Gorge National Scenic Area ^b	Oregon and Washington	100 / ESE	0.01	0.10	No
Mount Rainer Nation Park	Washington	137 / NE	0.03	0.10	No
Mount Adams Wilderness Area	Washington	145 / East	0.02	0.10	No
Mount Hood Wilderness Area	Oregon	150 / SE	0.02	0.10	No
Goat Rocks Wilderness Area	Washington	153 / ENE	0.02	0.10	No
Olympic National Park	Washington	154 / North	0.02	0.10	No
^a Values listed above are the maximum concentration 50 km from the terminal in the direction specific to each area of interest. ^b Not a federal Class I Area but required by the ODEQ to be analyzed.					

All modeled concentrations at distances of 50 kilometers from the terminal would be below the significance level; therefore, no further analysis was required to demonstrate acceptable project impacts. Based upon this screening we do not anticipate significant impacts on Class I areas.

Oregon Major New Source Review

Oregon implements a Major New Source Review Program encompassing new facility construction or modification in nonattainment and attainment/unclassifiable areas (OAR 340-224).

Because the planned project is located in attainment/unclassifiable areas for all criteria pollutants, only the PSD portion of Oregon's Major New Source Review Program is potentially applicable. The Oregon Major New Source Review Program uses the same applicability determination as is used for the federal PSD program. As mentioned previously, projected potential emissions from the proposed Bradwood Landing LNG terminal would not exceed the federal major source PSD threshold. Therefore, the proposed facility would not be subject to Oregon's Major New Source Review Program.

General Emission Standards

The proposed LNG terminal would be subject to three provisions from Oregon's general emission standards in OAR 340-226. The first provision mandates that particulate emissions from any individual source may not exceed 0.1 grains per standard cubic foot of effluent (OAR 340-226-210).

The second provision requires that certain emission units at stationary sources meet Typically Achievable Control Technology (TACT). The SCVs would be subject to TACT because the Bradwood Landing LNG facility would require a permit, and the SCVs each would have emissions of more than 1 tpy and would not be subject to major source New Source Review, New Source Performance Standards, or other emission limits specified in OAR 340-226-130(2)(a). Procedures for identifying air pollution control equipment and emission reduction processes that meet TACT are not included within Oregon's regulatory text. However, if the ODEQ notifies NorthernStar that it intends to make a TACT determination for the SCVs, then the proposed facility would need to submit any requested information and comply with the final TACT determination.

Finally, the general emission standards also mandate that "the highest and best practicable treatment and control of air contaminant emissions must in every case be provided." However, a source is deemed to be in compliance with the "highest and best" requirement if it is in compliance with all other applicable requirements in OAR 340, Divisions 200 through 268. Because NorthernStar intends to comply with each applicable requirement, the Bradwood Landing LNG terminal facility would be in compliance with the "highest and best practicable treatment."

Fuel Burning Equipment and Fuel Sulfur Content

The proposed LNG terminal would use fuel burning equipment that would be subject to particulate limits and fuel sulfur content limits under OAR 340-228. Under this rule, "fuel burning equipment" is defined as equipment (other than internal combustion engines) whose purpose is to produce heat or power by indirect heat transfer. Several of the standards in OAR 340-228 would not apply to certain emission units, as follows.

- The firewater pump would be exempt from this rule because it would be an internal combustion engine.
- The SCVs would be exempt from SO₂ limits because they burn natural gas.
- The emergency generator would be exempt from SO₂ limits because its heat input capacity is less than 150 MMBtu/hr.

However, particulate limits would apply to the SCVs and the emergency generator. This equipment would be subject to an emission limit of 0.1 grain of particulate per standard cubic foot of effluent. In addition, two sulfur content limits would apply to fuels that are sold, distributed, or used by the proposed facility (with the exception of fuel used exclusively for propulsion and auxiliary power for vessels, railroad locomotives, or diesel motor vehicles).

- Residual fuel oil may not contain more than 1.75 percent sulfur by weight.
- Distillate fuel oil may not contain more than 0.3 percent sulfur by weight for ASTM (American Society for Testing and Materials) Grade 1 fuel oil, or 0.5 percent sulfur by weight for ASTM Grade 2 fuel oil.

Visible Emission and Nuisance Requirements

State visible emissions and nuisance abatement regulations are codified in OAR 340-208. Both construction and operation phases of the proposed LNG terminal would be subject to visible emission limits stated in terms of opacity. In Oregon, the LNG terminal may not emit contaminants causing opacity to equal or exceed 20 percent in any period or periods aggregating more than 3 minutes in any hour. In addition, no person may create an observable deposition of particulate matter on another person's property (OAR 340-208-540).

The state of Oregon imposes specific fugitive emission control requirements on facilities that are located within “special control areas” or are determined to be a nuisance by the ODEQ. The proposed Bradwood Landing LNG terminal would not be located in a special control area because it would not be located in counties or basins listed in OAR 340-204-0070, nor would it be located within 3 miles of the corporate limits of a city having a population of 4,000 people or more. Fugitive emission requirements within OAR 340-208-210 would apply to the facility only if it were deemed to be a nuisance. If the ODEQ determined that the project was a nuisance, NorthernStar would need to enter into a Best Work Practices Agreement with the ODEQ. NorthernStar’s terminal ESC Plan contains BMPs for dust suppression, which would include the use of groundwater from the on-site well. No chemicals would be used for dust suppression.

Energy Facility Siting Requirements (Oregon Department of Energy)

Most large energy facilities in Oregon are under the jurisdiction of the Oregon Energy Facility Siting Council (Council). The Oregon legislature determines what types of energy facilities require Council review. An energy facility developer must apply to the Council for a site certificate and must supply information about the proposed facility and the proposed site.

In 1997, the Oregon legislature gave the Energy Facility Siting Council authority to set CO₂ emissions standards for new energy facilities. Division 24 of the Council’s rules, beginning at OAR 345-024-0500, contains specific standards for base load gas plants, non-base load (peaking) power plants and non-generating energy facilities that emit carbon dioxide. The standard for non-generating energy facilities is expressed as a rate of emissions per horsepower hour: 0.504 pounds of CO₂/hp-hr. CO₂ would be formed during the operation of the Bradwood Landing LNG terminal as a primary product of diesel and gas combustion in the SCVs, emergency generator, and emergency firewater pump engine. In 2005, the Council had initiated development of additional criteria for LNG terminals.

The EPCRA of 2005 contains a provision that the FERC has exclusive jurisdiction over LNG import facilities. As a result, the Council has stated that it would not be asserting jurisdiction over LNG import terminals. As well, the ODE stopped all work related to rulemaking for LNG facilities.

Oregon Governor Ted Kulongoski directed state agencies to participate in the FERC’s review of any LNG import terminals in Oregon. He designated the ODE as the lead agency in working with FERC on proposed projects, including the coordination of state agency response on any application. The Governor also designated the ODE as the state’s lead agency for working with FERC on LNG import terminal safety and security issues.

Although the Council acknowledges that the FERC has jurisdiction over the siting of LNG import terminals and there are no specific standards for LNG facilities, the ODE has requested that the Bradwood Landing Project voluntarily comply with the CO₂ standards for non-generating energy facilities. CO₂ is not a federally regulated pollutant but is considered a GHG, along with other gases such as methane and chlorofluorocarbons. GHG emissions are the primary driver of the increase in global mean temperature, known as global warming. NorthernStar has agreed to voluntarily comply with the ODE's request.

Air Quality Impacts and Mitigation

Construction of the proposed LNG terminal would have temporary adverse impacts on air quality due to fugitive dust emissions. Construction at the terminal site would include dredging of the river channel to accommodate LNG carriers, construction of the wharf and docking facilities, and construction and installation of on-site equipment. Construction at the proposed terminal site would occur over approximately 3 years.

NorthernStar proposes to reduce fugitive emissions from terminal construction areas. When dust is considered to be a possibility during a specific site construction activity in the terminal area, mitigation measures would be included in the task-specific method statement for the work. The terminal ESC Plan states that the ODEQ's BMPs for dust control (EP-13) would be followed to stabilize soil from wind erosion and to reduce dust generated by construction activities. However, NorthernStar would use only water, which would be obtained from the on-site water well, and would not use other types of dust palliatives. Stockpiled materials would be stabilized either by applying water or by covering. Dust control would be provided daily (or as often as needed depending on wind conditions, time of year, and the physical conditions of the site). Water applied for dust control would be applied evenly and without over-watering to avoid runoff that could result in erosion.

The concrete plant located at the terminal site would be operated in a manner designed to minimize the risk of cement dust releases. The environmental coordinator would conduct regular inspections to ensure that BMPs are employed to reduce fugitive dust emissions. In addition, NorthernStar proposes to pave Bradwood Road, which provides access to the area from paved Clifton Road.

Construction of the LNG terminal would also result in tailpipe emissions from a variety of sources, including cranes, forklifts, front end loaders, dump trucks, graders, generators, vibratory rollers, concrete pumps and trucks, water trucks, and pick-up trucks. Non-road construction vehicle emissions were estimated using emission factors from the EPA AP-42 compilation. During construction of the LNG terminal, construction equipment is assumed to operate 10 hours per day, 5 days per week, with the exception of the dredge and associated equipment. In tables 4.10.1-13 and 4.10.1-14, the estimated construction emissions are summarized. In addition, total NO_x, CO, and VOC emissions during construction of the LNG terminal are compared to regional air emissions estimated from 2002 ODEQ data for Clatsop and Columbia Counties.

Impacts associated with construction vehicles are difficult to estimate based on the time and space variant characteristics of the emissions. Estimates are complicated by the fact that the construction equipment would not follow defined paths (such as paved roadways) and would frequently change speed and direction. Furthermore, due to the intermittent and temporary nature of these emissions, their long-term impact on air quality would be minimal. In addition, the primary pollutants emitted by the construction vehicles would be NO_x and CO. The ambient air quality standard for NO₂ is an annual average and the CO standards are significantly higher than any other standards (see table 4.10.1-1). For these reasons, the short-term and intermittent NO₂ and CO emissions from the construction vehicles are not expected to exceed the NAAQS for NO₂ or CO.

TABLE 4.10.1-13								
Estimated Total and Peak Hourly Construction Emissions for LNG Terminal (NO _x , CO, SO ₂ , and PM ₁₀)								
Emission Source	NO _x		CO		SO ₂		PM ₁₀

To reduce tailpipe emissions from vehicles, NorthernStar proposes to use the following measures to reduce emissions from construction equipment and commuter vehicles:

- limit truck idling as much as possible;
- properly maintain construction equipment in accordance with manufacturers' specifications or standard practices;
- encourage construction workers to carpool to the construction site; and
- implement a shuttle service to or from retail services and food establishments during lunch hours, or provide lunch services at the site.

Operation of the LNG terminal would result in air emissions from: stationary equipment (SCVs and emergency engines), LNG carriers, security vessels, and tugs. The Bradwood Landing LNG terminal would operate 24 hours per day, 7 days per week (8,760 hours per year). Typically, six SCVs would operate to achieve an average LNG sendout rate of 1.0 Bcfd. To achieve a peak sendout rate of 1.3 Bcfd, the seventh SCV would also operate. The diesel firewater pump and the diesel emergency generator would be operated on an emergency basis and for 1 hour each week for testing. Results of an AQIA evaluating operation of the proposed LNG terminal are discussed above in the State Air Quality Requirements section.

During LNG unloading operations, the proposed terminal would include a vapor management system to handle the BOG. During normal operations, no vapors would be discharged to the atmosphere; instead, vapors would be contained and recycled or used for fuel. In the event of non-routine conditions such as evacuating vapors from equipment before maintenance or to avoid overpressure conditions, vapors would be vented to the atmosphere. The vapor management system would include a vent to discharge vapors at a safe elevation. No flares would be used at the terminal facility.

Finally, NorthernStar would implement a policy to address local complaints regarding nuisance emissions. NorthernStar proposes to set up a contact telephone number that would allow citizens to call the site environmental coordinator and report nuisance emissions. The proposed policy would include a requirement to respond to complaints by conducting a terminal inspection and take corrective action. A written report of the complaint and actions taken would be kept on file at the facility.

4.10.1.3 Pipeline Facilities

Climate

The associated proposed 36.3-mile natural gas sendout pipeline would cross Clatsop and Columbia Counties in Oregon and Cowlitz County in Washington. The proposed pipeline route is within the coastal Columbia River Valley climate region, described in section 4.10.1.1. Clatsop and Columbia Counties are two of the six counties designated as the Northwest Region by the ODEQ.

Climate data from the NWS climate stations at Astoria Regional Airport in Clatsop County and the Kelso-Longview Regional Airport in Cowlitz County are available from the Western Regional Climate Center from January 1, 1899 to the present. These data should be representative of conditions in the area of the proposed pipeline route.

Ambient Air Quality Standards

The NAAQS and state AAQS applicable to the counties where the pipeline would be constructed are described in section 4.10.1.1.

Existing Air Quality

Clatsop, Columbia, and Cowlitz Counties are all currently designated as attainment or unclassifiable for all NAAQS criteria pollutants. Motor vehicles are a primary source of air pollution in each county, with large industrial facilities accounting for less than 15 percent of most types of criteria pollutants. Cowlitz County in Washington has some concentrated industrial development, including paper mills and power plants. Other sources of air pollution in both states include human activities such as outdoor burning, using wood stoves, and using non-road vehicles (e.g., gasoline-powered lawn mowers, motor boats, etc.).

Construction of the proposed pipeline would cause temporary gasoline and diesel combustion emissions associated with operating construction equipment and vehicles. Fugitive dust would also be generated by site preparation activities and equipment travel. These emissions would occur during the projected 7-month construction period.

Air Quality Control Regions

Like the Bradwood Landing LNG terminal, the Clatsop County portion of the proposed pipeline would be located in the Northwest Oregon Intrastate AQCR (40 CFR 81.249). The remaining portion of the pipeline in Columbia and Cowlitz counties would be located in the Portland Interstate AQCR (40 CFR 81.51).

Regulatory Requirements for Air Quality

Emissions from all phases of construction and operation of the proposed pipeline would be subject to applicable state and federal air regulations. Most air quality regulatory programs address emissions from stationary sources of air pollution. Because no compression facilities are proposed for the pipeline, there will be few air quality compliance requirements applicable to ongoing pipeline operations. Air quality regulations affecting pipeline construction are primarily concerned with reducing emissions associated with construction equipment and fugitive dust.

The proposed pipeline air emission sources are regulated at the federal level by the CAA, as amended, and at the state level by OAR and Washington's SWCAA.

Federal Air Quality Requirements

The federal air quality requirements that pertain to the Bradwood Landing Project are discussed above in section 4.10.1.2. Specific regulations applicable to the proposed pipeline would be those applicable to emissions from mobile sources (i.e., construction equipment) and fugitive dust emissions.

State Air Quality Requirements

The Oregon state air general emission standards, discussed in section 4.10.1.2 relative to the LNG terminal, would also be applicable to the proposed pipeline.

In Oregon, the construction and operation phases of the proposed pipeline would be subject to visible emission limits stated in terms of opacity. The pipeline project may not emit contaminants causing opacity to equal or exceed 20 percent in any period or periods aggregating more than 3 minutes in any hour. In addition, no person may create an observable deposition of particulate matter on another person's property (OAR 340-208-540).

In Washington, SWCAA Regulation 400-040 imposes fugitive dust emission controls on activities such as pipeline construction. These rules require that persons take reasonable precautions to prevent the release of air contaminants from the construction activities.

A new Washington regulation (SWCAA Regulation 400-045) became effective on December 15, 2005, that creates a permit program for non-road internal combustion engines that, in aggregate, equal or exceed 200 horsepower. However, NorthernStar would not be required to obtain permits under this regulation for non-road internal combustion engines used to construct the pipeline in Washington (Safford, 2006).

Air Quality Impacts and Mitigation

Construction of the proposed pipeline would have temporary adverse impacts on air quality due to fugitive dust emissions. Construction of the pipeline would occur over approximately 7 months.

During pipeline construction, NorthernStar would employ one or more of the following methods to reduce fugitive dust emissions:

- apply water or chemical dust suppressants to disturbed land;
- reduce vehicle speeds on paved and unpaved roads;
- minimize material transfer distances;
- return disturbed areas to normal vegetation as soon as possible;
- minimize travel on disturbed or stabilized land; and
- stop construction activities if high winds and/or very low humidity cause excessive dust.

Construction of the pipeline would also result in tailpipe emissions from a variety of sources, including miscellaneous trucks, bulldozers, backhoes, and side-boom tractors. Non-road construction vehicle emissions were estimated using emission factors from the EPA AP-42 compilation. The estimated construction emissions are summarized in tables 4.10.1-15 and 4.10.1-16. In addition, total NO_x, CO, and VOC emissions for the pipeline construction are compared to regional air emissions estimated from 2002 ODEQ data for Clatsop and Columbia Counties.

As discussed in section 4.10.1.2, the short-term and intermittent NO₂ and CO emissions from the construction vehicles are not expected to exceed the NAAQS for NO₂ or CO. In section 4.10.1.2, we describe specific measures NorthernStar proposes to reduce tailpipe emissions from construction equipment and commuter vehicles, as well as its proposal to implement a policy to address local complaints regarding nuisance emissions.

4.10.1.4 Greenhouse Gas Emissions

We received several comments regarding the emissions of GHGs from the project. The principle GHGs are methane, CO₂, nitrous oxide (N₂O), and various fluorinated gases which trap heat in the atmosphere and are the primary drivers of the increase in global mean temperature, known as global warming. No fluorinated gases would be emitted by the project, so we need only look at N₂O, methane and CO₂. There are no federal regulations at this time limiting the emissions of CO₂; however, emissions of N₂O are regulated through limitations of NO_x emissions under NSPS and federal permits. Methane emissions are limited by valve and pipe leak standards.

Emissions of GHGs are typically estimated as carbon equivalents, or carbon dioxide equivalents. The GHGs are ranked by their global warming potential (GWP). The GWP is a ratio relative to CO₂ which is based on the properties of the GHGs to absorb solar radiation as well as the residence time

within the atmosphere (Intergovernmental Panel on Climate Change, 2007). Thus CO₂ has a GWP of 1. Methane has a GWP of approximately 21, and N₂O has a GWP of approximately 310. NorthernStar has estimated the emissions of CO₂ and some of the methane from the project. It should be noted that we do not have estimates of the N₂O and all of the methane emissions so the total amount of GHG equivalents may be larger.

We estimate that construction of the terminal and associated pipeline would emit approximately 146,000 tons of CO₂ during the entire construction period and annual operations would emit an estimated 102,000 tons of CO₂. Although the GHG emissions appear large, the operational emissions are less than 1/100th of 1 percent of the 2006 U.S. Greenhouse Gas Inventory (EPA 2007) of 7.2 Gigatons. The GHG emissions of this natural gas project would be much less than GHG emission for an equivalent oil or coal project, as explained in Section 3.1.1.3.

We received a May 7, 2008 LNG and Natural Gas Review by the ODE (2008b), filed on May 9, 2008 through a letter from the Governor of Oregon. The report included a literature review, summary and comparison of life-cycle assessments of LNG-based natural gas, domestic natural gas, synthetic gas (syngas), and coal. A life-cycle assessment looks at all the CO₂ emitted during the entire “life” of the fuels, from extraction, transportation, processing, and end use. It should be noted that this is very different from the approach the EPA takes in regard to regulation of criteria pollutants, which typically regulate emissions at the point of release. There have been numerous pieces of draft legislation introduced in the United States Senate and House of Representatives that propose in some fashion to regulate the emission of GHG. Some of these draft bills would impose upon importers of fuels some sort of GHG reporting, while others do not and would leave it to the discretion of the EPA. There are two primary regulatory frameworks that have been proposed in the draft legislation. One regulatory framework would be a “cap and trade” system, which would cap the overall emissions while developing a market to buy and sell emission allotments of CO₂. The second approach would impose a carbon tax on fuels, thus penalizing use of the most carbon intensive fuels. This summary is not intended to be a comprehensive list of proposals, merely a brief description of the two primary methods to regulate CO₂. Should the United States government decide to regulate the emission of CO₂ and other GHG, it is not known at this time how the legislation and implementing regulations would be crafted.

Intrinsic in the ODE’s analysis is that carbon capture and storage (CCS) would be a viable technology within 20 years. CCS involves removing a portion of the CO₂ from combustion emissions and injecting it into geologic formations so that it does not enter the atmosphere. To this point, only limited trials have been attempted for capturing carbon. Carbon sequestering is not economically or technologically feasible at this time; although it has been used in the production of syngas. The ODE admits that “it is difficult to assess when CCS will become a commercial technology.”

The ODE determined that for electric generation, the life-cycle emissions of CO₂ for LNG is approximately the same as for syngas with upstream carbon sequestration, is significantly less than coal, and is greater than domestic sources of natural gas. It should be noted that without the CCS in the syngas creation process, the emissions of CO₂ from the life cycle of syngas are significantly greater than LNG-sourced natural gas. In general we do not dispute the ODE’s contention that domestically produced natural gas would have lower life-cycle emissions of CO₂ than LNG-sourced natural gas. However, natural gas from LNG would only produce between 6 to 12 percent more GHG than domestic natural gas transported by interstate pipelines if both were combusted in conventional electric power plants. The ODE added the GHG associated with fuels used to liquefy the natural gas into LNG, ship it long distances in LNG carriers, and vaporize it back into natural gas at the import terminal as part of its equation for determining the life-cycle emissions for LNG.

The ODE contends that the importation and vaporization of LNG would hinder Oregon's effort to meet 1990 levels of GHG by 2020. This determination relies upon a number of assumptions, including: that the LNG facility must also include CO₂ emissions from the transportation of the LNG (and possibly extraction and processing); that the natural gas would be used primarily in Oregon; and that the natural gas would not displace more carbon intensive fuels such as coal and fuel oil. Without federal regulatory guidance, it is difficult for us to postulate what might be required by future GHG rules. While it is certainly possible that the LNG facility may delay meeting Oregon's GHG 2020 target, it is also possible that under systems such as a cap and trade or a carbon tax regulatory framework that it may accelerate Oregon's ability to meet its GHG goals by 2020.

4.10.2 Noise

Noise would be generated by LNG marine traffic along the waterway, during construction and operation of the LNG terminal, and during construction of the pipeline. At any location, both the magnitude and frequency of environmental noise may vary considerably over the course of the day and throughout the week. This variation is caused in part by changing weather conditions and the effects of seasonal vegetative cover. Federal agencies use two measures to relate the time-varying quality of environmental noise to its known effect on people. The $L_{eq(24)}$ is the level of steady sound with the same total (equivalent) energy as the time-varying sound of interest, averaged over a 24-hour period. A second measure, the L_{dn} is calculated by adding 10 dB on the A-weighted scale (dBA) to the nighttime sound levels between the hours of 10 PM and 7 AM to account for the greater sensitivity of people to sound during the nighttime hours. The A-weighted scale is used because human hearing is less sensitive to low and high frequencies than mid-range frequencies.

Noise Regulations

In 1974, the EPA published Information on *Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety* (EPA, 1974). This publication evaluates the effects of environmental noise with respect to health and safety. The document provides information for state and local governments to use in developing their own ambient noise standards. The EPA has determined that in order to protect the public from activity interference and annoyance outdoors in residential areas, noise levels should not exceed an L_{dn} of 55 dBA. An L_{dn} of 55 dBA is equivalent to a continuous noise level of 48.6 dBA for facilities that operate at a constant level of noise. The FERC has adopted this criterion for new compression and associated facilities, and it is used here to assess the potential noise impact from operation of the LNG terminal.

No noise regulations associated with the adjacent receiving properties have been identified in relation to the waterway for LNG marine traffic.

Oregon Administrative Noise Regulation

The noise program of the ODEQ is promulgated under ORS Chapter 467 and OAR 340-035-035, Noise Control Regulations for Industry and Commerce. While the noise regulations are no longer enforced by the ODEQ, the regulations still remain in effect.

Because the Bradwood Lumber Mill has been abandoned for over 45 years without substantial commercial operations, the site of the proposed LNG terminal would be considered a "Previously Unused Industrial or Commercial Site" as defined in OAR 340-035-0015(47). According to OAR 340-035-035(1)(b)(B), no new noise source should increase ambient noise levels, L_{10} or L_{50} , by more than 10 dBA in 1 hour, or exceed a daytime noise level (7 AM to 10 PM) of L_{50} 55 dBA, L_{10} 60 dBA, or L_1 65 dBA; or a nighttime noise level (10 PM to 7 AM) of L_{50} 50 dBA, L_{10} 55 dBA, or L_1 60 dBA.

OAR 340-035-035 section 5 lists exemptions for emergency equipment, warning devices not operating continuously for more than 5 minutes, sounds that originate on construction sites, and sounds created in construction or maintenance of capital equipment.

The ODEQ noise regulations also have a provision for the designation of “quiet areas” (OAR 340-035-015(50)). However, no indication has been found that such a quiet area has been designated within the general area of the proposed LNG terminal.

Statistical noise level descriptors, such as those cited in the ODEQ regulations (L_{50} , L_{10} , L_1) are nearly impossible to predict without extremely detailed knowledge of exactly what type of equipment would be present and precisely when each piece would be in operation, for how long, and at what load. Instead conservative estimates were constructed above the L_{eq} noise level, and assumptions have been made that the predicted L_{eq} level would be approximately equal to the stated L_{50} level, and the L_{eq} level was used as a basis for determining noise impacts relative to the ODEQ standard.

Clatsop County, Oregon has a noise ordinance that would: 1) restrict blasting with 1,000 feet of a dwelling; and 2) restrict unreasonably loud noise that disturbs the peace and tranquility of any neighborhood or person between the hours of 10 PM and 7 AM. However, this ordinance does not have any quantitative thresholds for noise restrictions.

Washington Administrative Code

The rules establishing maximum permissible noise levels are contained in WAC Chapter 173-60, relating to maximum environmental noise levels. WAC Chapter 173-60 establishes three classes of environmental designations for noise abatement (EDNA), which are the areas or zones within which the maximum permissible noise levels are set. These EDNA zones are defined with respect to land use and can usually be transferred to previously-established classifications in existing zoning ordinances or comprehensive plans.

The maximum environmental noise level from an industrial area (EDNA Class C) at a residential area (EDNA Class A) is 60 dBA during the day and 50 dBA at night (10 PM to 7 AM). Noise from temporary daytime construction activities and blasting is exempt from these limits.

No local noise regulations were identified for either Wahkiakum County, Washington or the town of Cathlamet, Washington.

Threshold Summary

Based on a review of the current regulations the following noise thresholds are identified for comparison with projected noise levels:

- the 55 dBA L_{dn} for any 24-hour period;
- an average daytime L_{eq} of 60 dBA in Washington or 55 dBA in Oregon; and
- an average nighttime (10 PM to 7 AM) L_{eq} of 50 dBA in Washington and Oregon.

4.10.2.1 Waterway for LNG Marine Traffic

Existing Noise Levels

Existing noise levels are dependent on the size, frequency, and type of vessel traffic using the waterway. Ongoing dredging activities also contribute to the overall background noise. Tugs and LNG

carriers are known to produce noise at 61 and 64.3 dBA, respectively, at a distance of 300 feet (FEED Expansion, 2005). When no vessel or dredging activities are present, background noise ranges from rural residential (40 – 45 dBA) to wilderness (35 dBA).

Operational Impacts

As discussed above, the intermittent operation of LNG carriers and tugs in the waterway will contribute to an increase in the background noise level. There would be a temporary noticeable increase in noise to the receptors along the waterway as an LNG carrier and escort vessels pass; however, given the relatively low frequency of ship and tug traffic, the overall day and nighttime-weighted noise level should not change significantly from existing background conditions. The noise levels from LNG carriers and tugs during docking and unloading at the LNG terminal are addressed below under the LNG terminal (see section 4.10.2.2) and the impact on aquatic resources is discussed in sections 4.5.1.1 and 4.6.2.1.

4.10.2.2 LNG Terminal

Existing Noise Levels

A series of long- and short-term noise measurements were conducted at nearby noise-sensitive areas (NSAs) January 4-6, 2006. The nearest NSAs are listed in table 4.10.2-1 and shown on figure 4.10.2-1.

TABLE 4.10.2-1		
Nearest Noise-Sensitive Areas		
Description	Distance to Property Line	Direction
N1	Directly Adjacent	north
N2	1,000 feet	east
N3	4,224 feet	east
N4	11,880 feet	east
N5	6,067 feet	south

These sites were chosen to be generally representative of the closest noise-sensitive land uses in each general direction from the site. N1, a small cluster of homes off of Clifton Road northwest of the proposed LNG terminal site, was selected to represent the closest NSA to the northwest along the Columbia River. N2, representing a group of riverfront homes on Puget Island, was selected to represent the closest NSAs to the east across the channel on Puget Island. Location N3, near the northern tip of the island but shielded from river-related noise, was selected to be representative of inland sites on Puget Island with lower existing ambient levels, but maximum project related noise. N4, at Elochoman Slough Marina in Cathlamet, Washington, was selected to be representative of a noise-sensitive recreational land use (including picnic areas, boat slips, and RV camping sites). N5, at the Bradley State Scenic Viewpoint, was selected to be the closest recreational NSA to the south of the proposed LNG terminal site. The five identified sites were used for both noise measurements and to predict future noise levels due to proposed LNG terminal construction and operation.

Meteorological conditions during the period available for noise measurements were adequate to obtain sufficient noise measurement data. The noise measurements were sufficient to estimate daytime and nighttime equivalent sound levels (L_{eq}) and day-night noise levels (L_{dn}) for NSAs nearest to the proposed LNG terminal site.

Figure 4.10.2-1
Bradwood Landing Project
 Noise Sensitive Areas / Noise Measurement Locations

Existing audible noise sources were noted during the site visit and noise measurements. In general, the selected noise measurement and analysis sites were representative of typical semi-rural conditions, with a variety of noise sources contributing to the existing ambient noise levels.

The measured daytime and nighttime ambient L_{eq} levels and the calculated L_{dn} levels are summarized in table 4.10.2-2.

TABLE 4.10.2-2			
Background Noise Levels at Property Line and Nearest NSAs			
Monitoring Location	Day L_{eq} (dBA)	Night L_{eq} (dBA)	L_{dn} (dBA)
N1 – Community of Clifton	44	35	44
N2 - Puget Island Across from the LNG Terminal	43	41	48
N3 - North End of Puget Island	44	38	46
N4 - Cathlamet Marina	51	45	53
N5 - Bradley Scenic Viewshed	52	48	55

Construction and Operational Impacts

Potential impacts from the Bradwood Landing LNG terminal could be caused by short-term increases in noise during construction and increases in noise due to operation of the project in the long term. These potential noise increases were compared with the FERC and local noise standards for permissible noise at NSAs.

Construction Noise

Construction activities associated with the proposed LNG terminal could contribute temporary noise in and around the project area over a 36-month construction period. The most prevalent of these multiple sound sources are engine-driven construction equipment. Examples of these are excavators, compactors, front-end loaders, bulldozers, graders, backhoes, trucks, cranes, forklifts, welding machines, electrical generators, dredges, supply vessels, and tugboats.

Heavy equipment (e.g., bulldozers, loaders, and dump trucks) would be the primary noise source during the excavation phase. Noise levels from construction equipment would typically range from 65 to 85 dBA at 50 feet from the source. Estimated noise levels from typical construction equipment are listed in table 4.10.2-3. Noise generated during excavation would be primarily from diesel engine exhaust.

TABLE 4.10.2-3	
Estimated Construction Equipment Noise	
Equipment Type	Noise at 50 feet (dBA)
Heavy Equipment	85
Air Compressors	84
Welders	67
Concrete Truck	71
Miscellaneous Trucks (Pick-ups, etc.)	65
Source: EPA, 1971	

Typical construction activities would occur between 7 AM and 7 PM, 5 days per week. During concentrated periods, construction may include longer hours and additional days of the week to complete

a particular construction phase more efficiently. For example, pile driving would occur between the hours of 7 AM and 10 PM for an estimated 60 days spread over up to a 4-month period. However, NorthernStar has proposed that all noise-producing construction activities would be limited to daytime hours (7 AM to 10 PM), except for dredging activities (due to limits on the time period over which dredging may occur). Dredging would be conducted for up to 24 hours per day for approximately 48 to 72 days near the beginning of the project. Dredging noise is expected to range from 51 to 66 dBA at the nearest NSAs. Due to the nature of the noise from dredging and the length of time, we anticipate significant potential impacts due to noise from dredging activities. To ensure that noise levels at NSAs near the dredging locations sites do not experience significant noise impacts, **we recommend that:**

- **Prior to LNG terminal construction, NorthernStar should file with the Secretary, for review and written approval by the Director of OEP, a finalized dredging noise mitigation plan. This plan should identify all noise mitigation which NorthernStar would implement during dredging to reduce noise at the NSAs. Specifically, during dredging operations NorthernStar should monitor noise and make all reasonable efforts to restrict noise increases from operations to no more than 10 dBA above ambient if the resulting impact is above 55 dBA L_{dn} .**

Some construction activities at the proposed LNG terminal can produce high vibration levels, such as pile driving, sub-grade soil densification, and blasting. However, vibration levels traveling in soil drop off quickly with distance. The ground vibration level for typical pile driving would generally not be perceptible beyond about 500 feet (Hendricks, 2002). Because the closest vibration sensitive areas are approximately 2,500 to 3,000 feet away, construction vibration would be considered imperceptible at all vibration sensitive areas.

Recent technical literature presents a wide variation in underwater source noise levels and acoustical propagation under different conditions. A wide variety of values for impact pile driver noise are given for various driver-type/pile-type combinations. Based on preliminary engineering for the LNG terminal, steel pipe piles with diameters of 48-inch, 54-inch, 84-inch, and 96-inch-diameter steel piles are anticipated to be used for the wharf and mooring or breasting dolphins. Driving 96-inch-diameter steel piles using an impact hammer has been shown to generate peak sound pressure levels of up to 227 dB re: 1 μ Pa at 16 feet (Hastings and Popper, 2005). However, NorthernStar proposes to implement several measures to minimize underwater sound pressure levels, including the use of vibratory pile drivers, bubble curtains, and pile caps between the hammer and piles (see section 4.5.2.1).

Operational Noise

NorthernStar conducted noise attenuation modeling to predict noise levels that would be generated by operation of the LNG terminal. Activities that could generate noise at the proposed LNG terminal during typical operations would include ship mooring and unloading, and the operation of a number of pumps, compressors, SCVs, fans, and blowers. Equipment noise data from manufacturers and previously completed noise surveys associated with similar equipment was used to estimate the operational noise. The operational equipment list and associated noise sound power levels are presented in table 4.10.2-4.

The LNG carrier was modeled as a line source, and the tugboats were modeled as an area source surrounding the LNG carrier. Both were modeled as operating for 210 minutes per day to represent approximately two LNG carriers coming and unloading per week taking approximately 24 hours each for unloading operations.

TABLE 4.10.2-4											
Operational Equipment List											
Name (Model Number)	Measurement Type	Sound Power by Center Octave Frequency (Hz)								Overall dBA	Reference Distance

The model predicted noise levels at five NSA locations utilizing Scantech Inc.'s Cadna/A software. Modeling results for each of these NSA locations are presented in table 4.10.2-5.

TABLE 4.10.2-5					
Predicted L _{dn} Noise Levels at Nearest NSAs					
NSA	Distance (feet) and Direction to Property Line	Existing Ambient L _{dn} (dBA)	Predicted Facility Contribution (dBA)	Ambient + Facility (dBA)	Predicted Increase in Ambient (dBA)
N1 - Community of Clifton	Directly Adjacent north	44	40.4	45.6	1.6
N2 - Puget Island Across from LNG Terminal	1,000 east	48	50.2	52.2	4.2
N3 - North End of Puget Island	4,224 east	46	47.9	50.1	4.1
N4 - Cathlamet Marina	11,880 east	53	<35	53	0.0
N5 - Bradley Scenic Viewshed	6,067 south	55	<35	55	0.0

The highest predicted facility noise level is 50.2 dBA L_{dn} at NSA location N2, which is below the FERC L_{dn} of 55 dBA. Noise from the LNG terminal may be perceptible during relatively quiet periods.

To minimize the noise impact on nearby NSAs from LNG terminal operations, NorthernStar would incorporate the following noise attenuation measures, as appropriate, to meet the FERC and local requirements:

- noise barriers or enclosures to block sound transmission from operating equipment;
- valves with "low-noise" trims;
- acoustical insulation for aboveground piping; and
- selection of equipment types with the least noise emissions.

Given the predicted slight exceedance of the state noise limit of L_{eq} of 50 dBA (nighttime) and recognizing that actual results may be different from those obtained from modeling, **we recommend that:**

- **NorthernStar should file a noise survey for the LNG terminal with the Secretary no later than 60 days after placing the LNG terminal in service. If the noise attributable to the operation of the LNG terminal exceeds 55 dBA L_{dn} at any nearby NSAs, NorthernStar should file a report on what changes are needed and should install additional noise controls to meet the level within 1 year of the in-service date. NorthernStar should confirm compliance with these requirements by filing a second noise survey with the Secretary no later than 60 days after it installs the additional noise controls.**

4.10.2.3 Pipeline Facilities

Existing Noise Levels

The proposed Bradwood Landing pipeline would primarily cross a rural landscape of forested open space and farmland. However, the Wauna Mill is located between approximate MPs 3.0 to 4.0 and the PGE Beaver Power Plant is situated near the Columbia River crossing at MP 19.0. The only potential NSAs are residences along the route. On the Oregon portion of the corridor, three residences are confirmed within 50 feet of the proposed pipeline construction work area, based on property access (see table 4.7.3-7). There are more rural residences and low-density rural/suburban subdivisions along the Washington portion of the corridor, including six structures within 50 feet of the pipeline construction work area (see table 4.7.3-7).

HDD operations would create noise during construction of the pipeline and pressure reduction valves would create intermittent noise during operation of the pipeline. Existing sound levels for each of the HDD sites and pressure reduction valve sites are presented in tables 4.10.2-6 and 4.10.2-7. In all cases, existing sound levels were estimated. Noise levels were estimated based on low density, rural land use patterns except where major highways are near the nearest NSA. Where highways are nearby, noise levels were estimated based on traffic volumes.

Day ($L_{eq(day)}$) and night ($L_{eq(night)}$) equivalent sound levels for rural areas were estimated from measurements presented in *Community Noise* (EPA, 1971). Day-night average sound levels for areas near highways were calculated using methodology from *Noise Assessment Guidelines* (U.S. Department of Housing and Urban Development (HUD), 1984).

Construction and Operational Impacts

Potential impacts from the Bradwood Landing pipeline could be caused by short-term increases in noise during construction and increases in noise at valve sites due to operation of the project in the long term.

TABLE 4.10.2-6								
Existing Sound Levels for HDD Sites

Construction Noise

Construction activities associated with the proposed pipeline could contribute temporary noise in and around the project area. Increases in noise levels during construction of the pipeline would be limited to areas close to the construction activity. The magnitude of the impact would depend on the noise level generated by various equipment types, duration of the construction activity, and distance between the noise source and the receptor. Construction equipment would include miscellaneous trucks, bulldozers, backhoes, and side-boom tractors. Noise levels from construction equipment would typically range from 65 to 85 dBA at 50 feet from the source. At the nearest NSA, which is located about 23 feet from the pipeline centerline, noise levels could range as high as 79 to 99 dBA, assuming a worst-case scenario of equipment passing within 10 feet of the residence.

Impacts due to construction noise would be short term and temporary at any one place because of the assembly line method of pipeline construction. Pipeline construction activity would be limited to daytime hours between 7 AM and 7 PM, which would further minimize noise impacts. However, 24-hour HDD operations may be necessary at some locations depending on conditions. In these instances, measures such as use of “critical” class equipment mufflers or temporary noise barriers would be used to mitigate impacts on nearby residences. Consequently we believe that noise associated with pipeline construction would have minimal impacts on residences along the construction right-of-way.

Estimated noise levels for the entry locations of the HDD operations are presented in table 4.10.2-8. Noise levels at the HDD exit locations would be very similar to normal pipeline construction noise levels.

Noise levels for entry locations were based on actual field measurements at a large diameter pipeline directional drilling operation. As noted in table 4.10.2-8, noise effects were estimated for three different levels of noise control, one with “standard” mufflers, one with “critical” class mufflers (term from Caterpillar), and one with both “critical” class mufflers plus a temporary noise barrier. All of the jurisdictions crossed by the proposed pipeline have exemptions from noise regulations for construction activities.

HDD activities would generate noise impacts on the surrounding area. Each borehole would take from several days to weeks to complete and the drilling equipment would operate 24 hours per day. There is a significant potential for high nighttime noise levels at several HDD locations resulting from these construction activities. As indicated in table 4.10.2-8, without significant mitigation, noise can exceed 55 dBA at NSAs at most of the HDD sites. A noise increase of 3 dBA is rarely noticed, whereas a noise increase of 6 dBA is noticeable and a 10 dBA increase is perceived as a doubling of ambient sound. NorthernStar has prepared an HDD noise mitigation plan identifying the noise mitigation measures to be implemented during HDD activities to reduce noise levels at nearby NSAs. The plan provides for NorthernStar to monitor noise during HDD activities and make all reasonable efforts to restrict noise increases from HDD operations to no more than 10 dBA above ambient noise levels if the resulting impact is above 55 dBA L_{dn} . To ensure that noise levels at NSAs near the HDD sites do not experience significant noise impacts, **we recommend that:**

- **Prior to pipeline construction, NorthernStar should file with the Secretary, for the review and written approval of the Director of OEP, a finalized noise mitigation plan for HDD sites Nos. 3, 5, 7, 8, 9, 10, 11, 12, 13, as identified in table 4.10.2-6 of the final EIS. This plan should identify all noise mitigation that NorthernStar would implement during drilling activity to reduce noise at any nearby NSAs. Specifically, during HDD operations NorthernStar should monitor noise and make all reasonable efforts to restrict noise increases from HDD operations to no more than 10 dBA above ambient if the resulting impact is above 55 dBA L_{dn} .**

Operational Noise

Operation of the proposed pipeline would generate noise at only four locations where pressure reduction valves for taps would be located aboveground. A valve supplier has indicated the maximum sound pressure level for the valve type would be approximately 115 dBA at 3 feet from the valve. Because these facilities would operate 24 hours per day, it would be necessary to meet the nighttime standards specified in the applicable noise codes. Table 4.10.2-9 provides a summary of the estimated noise associated with the valves at the nearest NSAs. Noise attenuation would be provided to meet the 55 dBA L_{dn} noise standard.

TABLE 4.10.2-9

Estimated Sound Levels for Valve Sites

Location	Valve No.	NSA Distance (feet)	NSA Direction	Standard (dBA)	7 dB ^a Attenuation (dBA)	15 dB ^a Attenuation (dBA)
Wauna Mill	1	1,000	south	62.5	55.5	47.5
Northwest Natural	2	400	north	71.9	64.9	56.9
PGE Beaver Power Plant	3	3,100	north	48.3	41.3	33.3
Williams Northwest Pipeline	4	400	southwest	71.9	64.9	56.9

^a The manufacturer refers to noise attenuation of 7 dB as "Type 1" attenuation and 15 dB as "Type 2" attenuation.

Based on the preliminary engineering and the noise estimates shown above, the Northwest Natural and Williams Northwest pipeline valves would likely require additional noise control beyond selection of particular valve types. When detailed engineering evaluations are developed, the noise estimates for the NSAs near these two valves will be reevaluated. If necessary, the valves would be provided with enclosures to ensure the noise levels are below applicable standards. NorthernStar has prepared a noise mitigation plan for the Wauna Mill, Northwest Natural, and Williams Northwest pipeline valves to reduce noise at the NSAs to meet 55 dBA L_{dn} . Due to the potential for significant permanent impacts at homes near to these valve sites, **we recommend that:**

- **NorthernStar should file noise surveys with the Secretary no later than 60 days after placing the Wauna Mill, Northwest Natural, PGE Beaver Power Plant, and Williams Northwest pipeline valves into service. If the noise attributable to the operation of the authorized pipeline valves exceeds an L_{dn} of 55 dBA at any nearby NSAs, NorthernStar should file a report on what changes are needed and shall install the additional noise controls to meet the level within 1 year of the in-service date. NorthernStar should confirm compliance with the above requirement by filing a second noise survey with the Secretary no later than 60 days after it installs the additional noise controls.**

If NorthernStar verifies that noise impacts have been mitigated, as indicated by the recommendations, we believe that the construction and operation of the Bradwood Landing Project would not result in significant noise impacts on local residents.

4.11 RELIABILITY AND SAFETY

Three federal agencies share in the oversight of the safety and security of LNG import terminals: the FERC, the Coast Guard, and the DOT. The FERC authorizes the siting and construction of LNG import terminals and is the lead federal agency under NEPA to analyze the environmental, safety, security, and cryogenic design of proposed facilities. The Coast Guard has authority over safety of the LNG marine traffic and the marine transfer area. The Coast Guard also has authority over security of the LNG carriers and the entire LNG facility. In conjunction with this, the Coast Guard determines the suitability of waterways for LNG marine traffic by issuing an LOR. The DOT has exclusive authority to promulgate and enforce safety regulations and standards over the onshore LNG facilities beginning at the last valve immediately before the LNG storage tanks.

In February 2004, the three participating agencies entered into an Interagency Agreement to assure that they work in a coordinated manner to address the full range of issues regarding safety and security at LNG import terminals, including the terminal facilities and tanker operations, and to maximize the exchange of information related to the safety and security aspects of the LNG facilities and related marine operations. The FERC closely coordinates its pre-authorization review of the proposal with the Coast Guard and the DOT to ensure a seamless safety and security review.

The operation of the proposed Bradwood Landing LNG terminal poses a potential hazard that could affect the public safety without strict design and operational measures to control potential accidents. The primary concerns are those events that could lead to an LNG spill of sufficient magnitude to create an off-site hazard, including events occurring during the course of LNG carrier transits. However, it is also important to recognize the stringent requirements for the design, construction, operation and maintenance of the facility as well as the extensive safety systems to detect and control potential hazards.

With the exception of the October 20, 1944 fire at the LNG facility in Cleveland, Ohio, the operating history of U.S. LNG facilities has been free of LNG safety-related incidents resulting in adverse effects to the public or the environment. The 1944 Cleveland incident was attributed to the use of materials inadequately suited for cryogenic temperatures and the lack of spill impoundments at the site.²⁵ More recently, an operational accident occurred in 1979 at the Cove Point LNG facility in Lusby, Maryland, when a pump seal failed, resulting in gas vapors entering an electrical conduit and settling in a confined space. When a worker switched off a circuit breaker, the gas ignited, resulting in heavy damage to the building and a worker fatality. Lessons learned from this accident resulted in changing the national fire codes, with the participation of the FERC, to ensure that the situation would not occur again. The proposed facilities would be designed, constructed, and operated in compliance with these codes.

On January 19, 2004, a blast occurred at Sonatrach's Skikda, Algeria LNG liquefaction facility that killed 27 and injured 56 workers. No members of the public were injured. Preliminary findings of the accident investigation suggest that a cold hydrocarbon leak occurred at Liquefaction Train 40 and was introduced to the high-pressure steam boiler by the combustion air fan. An explosion developed inside the boiler firebox which subsequently triggered a larger explosion of the hydrocarbon vapors in the immediate vicinity. The resulting fire damaged the adjacent liquefaction process and liquefied petroleum gas separation equipment of Train 40, and spread to Trains 20 and 30. Although Trains 10, 20, and 30 had been modernized in 1998-1999, Train 40 had been operating with its original equipment since start-up in 1981.

Although there are major differences between the equipment involved in the accident at Skikda and that proposed by NorthernStar (i.e., high-pressure steam boilers that power refrigerant compressors

²⁵ For a description of the incident and the findings of the investigation, see "Report on the Investigation of the Fire at the Liquefaction, Storage, and Regasification Plant of the East Ohio Gas Co., Cleveland, Ohio, October 20, 1944," U.S. Bureau of Mines. February 1946.

would not be used here nor are they used at any LNG facility under the FERC's jurisdiction), the sequence of cascading events identifies potential failure modes that warrant further evaluation. As a result, we have provided a recommendation in section 4.11.2, *Cryogenic Design and Technical Review*, to address this issue.

A discussion of the principal properties and hazards associated with LNG is presented in section 4.11.1. A summary of our preliminary design and technical review of the cryogenic aspects of the LNG terminal is presented in section 4.11.2. Storage and retention systems are discussed in section 4.11.3. An analysis of the thermal radiation and flammable vapor cloud hazards resulting from a credible land-based LNG spill is presented in section 4.11.4, while the safety aspects of LNG transportation by ship is discussed and summarized in section 4.11.5. Emergency response and evacuation planning is discussed in section 4.11.6, and conclusions on marine safety is discussed in section 4.11.7. A discussion on security awareness related to terrorism is presented in section 4.11.8 and the reliability and safety issues related to the natural gas pipeline are discussed in section 4.11.9.

4.11.1 LNG Hazards

LNG's principal hazards result from its cryogenic temperature (-260° F), flammability, and vapor dispersion characteristics. As a liquid, LNG will neither burn nor explode. Although it can cause freeze burns and, depending on the length of exposure, more serious injury or death, its extremely cold state does not present a significant hazard to the public, which rarely, if ever, comes in contact with it as a liquid. As a cryogenic liquid, LNG will quickly cool materials it contacts, causing extreme thermal stress in materials not specifically designed for ultra-cold conditions. Such thermal stresses could subsequently subject the material to brittleness, fracture, or other loss of tensile strength. These hazards, however, are not substantially different from the hazards associated with the storage and transportation of liquid oxygen (-296° F) or several other cryogenic gases that have been routinely produced and transported in the United States.

LNG vaporizes rapidly when exposed to ambient heat sources such as water or soil. When released from its containment vessel and/or transfer system, LNG will generally produce 620 to 630 standard cubic feet of natural gas for each cubic foot of liquid. A large quantity of LNG spilled without ignition would form a vapor cloud that would travel with the prevailing wind until it either dispersed below the flammable limits or encountered an ignition source. If a large quantity of LNG is spilled in the presence of an ignition source, the resulting pool fire would produce high levels of radiant heat in the area surrounding the LNG pool.

A rapid phase transition (RPT) can occur when a portion of LNG spilled onto water changes from liquid to gas, virtually instantaneously. Unlike an explosion that releases energy and combustion products from a chemical reaction, an RPT is the result of heat transferred to the liquid inducing a change to the vapor state. The rapid expansion from the liquid to vapor state can cause locally large overpressures. RPTs have been observed during LNG test spills onto water. In some test cases, the events were strong enough to damage test equipment in the immediate vicinity of the LNG release point. The sizes of the overpressure events have been generally small and are estimated to be equivalent to several pounds of trinitrotoluene (TNT). Although such a small overpressure is not expected to cause significant damage to an LNG vessel, the RPT may increase the rate of LNG pool spreading and the LNG vaporization rate for a spill on water. The Government Accounting Office (GAO) released a report in February 2007 (GAO 2007 [GAO Report]) presenting a survey of experts in areas related to LNG risk, hazards, and consequence modeling. As presented in Appendix III of the GAO Report, the 19 LNG risk and hazard experts unanimously agreed that RPT "would be very unlikely to have a direct effect on the public"

Methane vapors, the primary component of natural gas, are colorless, odorless and tasteless, and are classified as a simple asphyxiant. Methane vapors may cause extreme health hazards, including death, if inhaled in significant quantities within a limited time. Although very cold methane vapors may cause freeze burns, any cloud resulting from an LNG spill would be continuously mixing with the warmer air surrounding the spill site. Dispersion modeling indicates the majority of the cloud would generally be within 25° F of the surrounding atmospheric temperature, with colder temperatures closest to the spill source. In addition, this modeling estimates that most of the cloud would be below concentrations resulting in oxygen deprivation effects, including asphyxiation, with the highest methane concentrations closest to the spill source. Therefore, asphyxiation and freezing normally represent a negligible risk to the public from LNG facilities. Also, as presented in Appendix III of the GAO Report, the 19 LNG risk and hazard experts unanimously agreed that asphyxiation would represent a negligible risk to the public.

Although LNG will not burn, methane vapors in a 5 to 15 percent mixture by volume with air are flammable. Once a flammable vapor-air mixture from an LNG spill has been ignited, the flame front will propagate back to the spill site if the vapor concentration along this path is sufficiently high to support the combustion process. Combustible materials within the flammable portion of the cloud may be within the flame and could be ignited. However, any events leading to a containment failure would most likely be accompanied by a number of ignition sources. The result would be an LNG pool fire, and subsequent radiant heat hazards, rather than the formation of a large unconfined vapor cloud.

Although, LNG is not explosive as it is normally transported and stored, natural gas vapors (primarily methane) can explode if contained within a confined space, such as a building or structure, and ignited. Occasionally, various parties have expressed the energy content of an LNG storage tank, or LNG carrier, in equivalent tons of TNT as an implied measure of explosive potential. However, such a simplistic analogy fails to consider that explosive forces are not just a function of the total energy content but also of the rate of energy release. For a detonation to occur, the rate of energy release must be nearly instantaneous, such as with a TNT charge initiated by a blasting cap. Unlike TNT or other explosives which inherently contain an oxidizer, an unconfined vapor cloud must be mixed with oxygen within the flammability range of the fuel for combustion to occur. For a large unconfined vapor cloud, the flammability range tends to exist at the mixing zone at the edges of the cloud. When ignited, flame speeds about 20 to 25 meters per second (66 to 82 ft/s) and local over pressures up to 0.2 psig have been estimated for unconfined methane-rich vapor clouds, well below the flame speeds and over pressures associated with detonation.

The potential for unconfined LNG vapor cloud detonations was investigated by the Coast Guard in the late 1970s at the Naval Weapons Center at China Lake, California. These experiments, as well as other subsequent tests, are mentioned in Appendix C of the Sandia Report. Using methane, the primary component of natural gas, several experiments were conducted to determine if unconfined vapor clouds would detonate. The tests indicated unconfined methane-air mixtures could be ignited, but no test produced unconfined detonation. There is no evidence suggesting that methane-air mixtures will detonate in unconfined open areas.

Further tests were conducted in the late 1970s to examine the level of sensitivity of an unconfined cloud to the presence of heavier hydrocarbons such as ethane and propane. As stated in section 5 of Appendix C of the Sandia Report, detonation sensitivity is affected by the level of refinement of natural gas stored as LNG. The series of tests on ambient-temperature fuel mixtures of methane-ethane and methane-propane indicated that the addition of heavier hydrocarbons influenced the tendency of an unconfined vapor cloud to detonate. Less processed product with greater amounts of heavier hydrocarbons is more sensitive to detonation. During these experiments, all successful detonations were initiated with an explosive charge in well-mixed vapor clouds at correct stoichiometric proportions. These are not representative of conditions which would be expected during a large-scale LNG spill. The

precise timing, necessary mixing, and required amount of initiating explosives render the possibility for detonation of a large unconfined vapor cloud as unrealistic. Detonation of an unconfined natural gas cloud is extremely difficult to achieve and is generally considered by scientists and researchers to be very unlikely to occur during an LNG spill.

Consequently, the primary hazards to the public from an LNG spill either on land or water would be from dispersion of the flammable vapors or from radiant heat generated by a pool fire.

4.11.2 Cryogenic Design and Technical Review

As part of its application and in response to the FERC staff's data requests, NorthernStar provided a front-end engineering design (FEED) for the proposed project. The FEED and technical review emphasizes the engineering design and safety concepts as well as the projected operational reliability of the proposed facilities. The principle areas of coverage include: materials in cryogenic environments; insulation systems; cryogenic safety; thermodynamics; heat transfer; instrumentation; cryogenic processes; and other relevant safety systems.

Study and evaluation of information for the proposed design and installation of the Bradwood Landing LNG terminal have been performed by the FERC staff. The FEED and specifications submitted for the proposed facilities to date are considered to be preliminary but would be the basis for any detailed design to follow. Although preliminary, this filed information provides an adequate basis to evaluate the safety and reliability of the proposed project. A significant amount of the design involving final selection of equipment manufacturers, process conditions, and resolution of some safety related issues would be completed in the next phase of the project development if authorization is granted by the Commission. This information would need to be filed with the FERC staff for review and approval.

As a result of the technical review of the information provided by NorthernStar in the submittal documents, a number of concerns were identified by the FERC staff relating to the reliability, operability, and safety of the proposed design. In response to the staff's questions, NorthernStar provided written responses prior to the technical conference held on September 13, 2006, and in a subsequent submittal on October 25, 2006, with revised FEED information. After review of the revised information, the FERC staff notes several areas of concern that require additional consideration and/or action on behalf of the company. Follow up on those items requiring additional action should be documented in reports to be filed with the FERC. As a result, **we recommend that:**

The following measures should apply to NorthernStar LNG Terminal design and construction details. Information pertaining to these specific recommendations should be filed with the Secretary for review and approval by the Director of OEP either: prior to initial site preparation; prior to construction of final design; prior to commissioning; or prior to commencement of service as indicated by each specific condition. Specific engineering, vulnerability, or detailed design information meeting the criteria specified in Order No. 683 (Docket No. RM06-24-000), including security information, should be submitted as critical energy infrastructure information (CEII) pursuant to 18 CFR 388.112. See *Critical Energy Infrastructure Information*, Order No. 683, 71 Fed. Reg. 58,273 (October 3, 2006). FERC Stats. & Regs. ¶ 31,228 (2006). Information pertaining to items such as: offsite emergency response; procedures for public notification and evacuation; and construction and operating reporting requirements would be subject to public disclosure. This information should be submitted a minimum of 30 days before approval to proceed is required.

- **Complete plan drawings and a list of the hazard detection equipment should be filed prior to initial site preparation. The list should include the instrument tag number,**

type and location, alarm locations, and shutdown functions of the proposed hazard detection equipment. Plan drawings should clearly show the location of all detection equipment.

- NorthernStar should provide a technical review of its proposed facility design that:
 - a. identifies all combustion/ventilation air intake equipment and the distances to any possible hydrocarbon release (LNG, flammable refrigerants, flammable liquids and flammable gases); and
 - b. demonstrates that these areas are adequately covered by hazard detection devices and indicate how these devices would isolate or shutdown any combustion equipment whose continued operation could add to or sustain an emergency.

NorthernStar should file this review prior to initial site preparation.

- Complete plan drawings and a list of the fixed and wheeled dry-chemical, fire extinguishing, and other hazard control equipment should be filed prior to initial site preparation. The list should include the equipment tag number, type, size, equipment covered, and automatic and manual remote signals initiating discharge of the units. Plan drawings should clearly show the planned location of all fixed and wheeled extinguishers.
- Facility plans showing the proposed location of, and area covered by, each monitor, hydrant, deluge system, hose, and sprinkler, as well as piping and instrumentation diagrams, of the firewater system should be filed prior to initial site preparation.
- A copy of the hazard design review and list of recommendations that are to be incorporated in the final facility design should be filed prior to initial site preparation.
- The final design of the fixed and wheeled dry-chemical, fire extinguishing hazard control equipment should identify manufacturer and model.
- The final design should include an updated fire protection evaluation carried out in accordance with the requirements of NFPA 59A, 2001 edition, chapter 9.1.2.
- The final design should include a minimum of eight permanent bench marks located equally spaced around the top of the concrete base slab for each LNG tank.
- The final design should include a discretionary vent valve for each LNG tank, operable through the distributed control system.
- The final design should include a shutoff valve at the suction and discharge of each high pressure LNG pump.
- The final design should specify that dual temperature elements and transmitters are provided for low temperature alarm and shutdown at the discharge of each vaporizer.

- The **final design** should include a check valve between the LNG vaporizer discharge shutoff valve and the discharge manual isolation valve.
- The **final design** should include a pilot relief valve or operated vent valve sized for thermal relief at the discharge of the vaporizer.
- The **final design** should include provisions for the future installation of LNG pumps for the vapor return KO drum and the boil-off compressor suction drum.
- The **final design** should specify that for LNG and natural gas service, branch piping and piping nipples less than 2 inches are to be no less than schedule 160.
- The **final design** should specify that spiral wound gaskets for LNG, natural gas service, or other hydrocarbon fluid service are to be equipped with inner and outer stainless steel retaining rings.
- The **final design** should specify that piping and equipment that may be cooled with liquid nitrogen are to be designed for liquid nitrogen temperatures, with regard to allowable movement and stresses.
- The **final design** should specify that the wharf area switchboards are connected to the backup generator.
- The **final design** should include details of the shutdown logic, including cause and effect matrices for alarms and shutdowns.
- The **final design** should include emergency shutdown of equipment and systems activated by hazard detection devices for flammable gas, fire, and cryogenic spills, when applicable.
- The **final design** should include details of the air gaps to be installed downstream of all seals or isolations installed at the interface between a flammable fluid system and an electrical conduit or wiring system. Each air gap should vent to a safe location and be equipped with a leak detection device that: should continuously monitor for the presence of a flammable fluid; should alarm the hazardous condition; and should shut down the appropriate systems.
- The **final design** should include a hazard and operability review of the completed design. A copy of the review and a list of the recommendations should be filed with the Secretary.
- The **final design** should provide up-to-date Piping & Instrument Diagrams (P&IDs) including a description of the instrumentation and control philosophy, type of instrumentation (pneumatic, electronic), use of computer technology, and control room display and operation. Drawings and all information should be clearly legible on 11- by 17-inch paper and the piping legend and symbology should be in accordance with accepted practice. All drawings should be filed in black and white. The following information should be included on the P&IDs:
 - a. equipment tag number, name, size, duty, capacity and design conditions;

- b. piping with line number, piping class specification, size and insulation;
 - c. LNG tank pipe penetration size or nozzle schedule;
 - d. piping specification breaks and insulation limits;
 - e. isolation flanges, blinds and insulating flanges;
 - f. valve type, in accordance with the piping legend symbol;
 - g. all control valves numbered;
 - h. all valve operator types and valve fail position;
 - i. instrumentation numbered;
 - j. control loops including software connections;
 - k. alarm and shutdown set points;
 - l. shutdown interlocks;
 - m. relief valves numbered, with set point;
 - n. relief valve inlet and outlet piping size;
 - o. car sealed valves and blinds;
 - p. equipment insulation;
 - q. drawing revision number and date;
 - r. all manual valves numbered, including check, vent, drain, and car sealed valves; and
 - s. alarm and shutdown set points.
- The final design should specify that all hazard detection equipment should include redundancy, fault detection, and fault alarm monitoring.
 - All valves including drain, vent, main, and car sealed valves should be tagged in the field during construction and prior to commissioning.
 - The design details and procedures to record and to prevent the tank fill rate from exceeding the maximum fill rate specified by the tank designer should be filed prior to commissioning.
 - A tabulated list of the proposed hand-held fire extinguishers should be filed prior to commissioning. The information should include a list with the equipment number, type, size, number, and location. Plan drawings should include the type, size, and number of all hand-held fire extinguishers.
 - Operation and Maintenance procedures and manuals, as well as safety procedure manuals, should be filed prior to commissioning.
 - The FERC staff should be notified of any proposed revisions to the security plan and physical security of the facility prior to commencement of service.

- Progress on construction of the LNG terminal should be reported in monthly reports filed with the Secretary. Details should include a summary of activities, projected schedule for completion, problems encountered and remedial actions taken. Problems of significant magnitude should be reported to the FERC within 24 hours.

In addition, the following measures should apply throughout the life of the facility:

- The facility should be subject to regular FERC staff technical reviews and site inspections on at least an annual basis or more frequently as circumstances indicate. Prior to each FERC staff technical review and site inspection, NorthernStar should respond to a specific data request including information relating to possible design and operating conditions that may have been imposed by other agencies or organizations. Up-to-date detailed piping and instrumentation diagrams reflecting facility modifications and provision of other pertinent information not included in the semi-annual reports described below, including facility events that have taken place since the previously submitted semi-annual report, should be submitted.
- Semi-annual operational reports should be filed with the Secretary to identify changes in facility design and operating conditions, abnormal operating experiences, activities (including ship arrivals, quantity and composition of imported LNG, vaporization quantities, boil-off/flash gas, etc.), plant modifications including future plans and progress thereof. Abnormalities should include, but not be limited to: unloading/shipping problems, potential hazardous conditions from off-site vessels, storage tank stratification or rollover, geysering, storage tank pressure excursions, cold spots on the storage tanks, storage tank vibrations and/or vibrations in associated cryogenic piping, storage tank settlement, significant equipment or instrumentation malfunctions or failures, non-scheduled maintenance or repair (and reasons therefore), relative movement of storage tank inner vessels, vapor or liquid releases, fires involving natural gas and/or from other sources, negative pressure (vacuum) within a storage tank and higher than predicted boiloff rates. Adverse weather conditions and the effect on the facility also should be reported. Reports should be submitted within 45 days after each period ending June 30 and December 31. In addition to the above items, a section entitled "Significant plant modifications proposed for the next 12 months (dates)" also should be included in the semi-annual operational reports. Such information would provide the FERC staff with early notice of anticipated future construction/maintenance projects at the LNG facility.
- In the event the temperature of any region of any secondary containment becomes less than the minimum specified operating temperature for the material, the Commission should be notified within 24 hours and procedures for corrective action should be specified.
- Significant non-scheduled events, including safety-related incidents (i.e., LNG or natural gas releases, fires, explosions, mechanical failures, unusual over pressurization, and major injuries) and security related incidents (i.e., attempts to enter site, suspicious activities) should be reported to the FERC staff. In the event an abnormality is of significant magnitude to threaten public or employee safety, cause significant property damage, or interrupt service, notification shall be made immediately, without unduly interfering with any necessary or appropriate

emergency repair, alarm, or other emergency procedure. In all instances, notification should be made to the Commission staff within 24 hours. This notification practice should be incorporated into the LNG facility's emergency plan. Examples of reportable LNG-related incidents include:

- a. fire;
- b. explosion;
- c. estimated property damage of \$50,000 or more;
- d. death or personal injury necessitating in-patient hospitalization;
- e. free flow of LNG that results in pooling;
- f. unintended movement or abnormal loading by environmental causes, such as an earthquake, landslide, or flood, that impairs the serviceability, structural integrity, or reliability of an LNG facility that contains, controls, or processes gas or LNG;
- g. any crack or other material defect that impairs the structural integrity or reliability of an LNG facility that contains, controls, or processes gas or LNG;
- h. any malfunction or operating error that causes the pressure of a pipeline or LNG facility that contains or processes gas or LNG to rise above its maximum allowable operating pressure (or working pressure for LNG facilities) plus the build-up allowed for operation of pressure limiting or control devices;
- i. a leak in an LNG facility that contains or processes gas or LNG that constitutes an emergency;
- j. inner tank leakage, ineffective insulation, or frost heave that impairs the structural integrity of an LNG storage tank;
- k. any condition that could lead to a hazard and cause a 20 percent reduction in operating pressure or shutdown of operation of a pipeline or an LNG facility;
- l. safety-related incidents to LNG vessels occurring at or en route to and from the LNG facility; or
- m. an event that is significant in the judgment of the operator and/or management even though it did not meet the above criteria or the guidelines set forth in an LNG facility's incident management plan.

In the event of an incident, the Director of OEP has delegated authority to take whatever steps are necessary to ensure operational reliability and to protect human life, health, property or the environment, including authority to direct the LNG facility to cease operations. Following the initial company notification, the Commission staff would determine the need for an on-site inspection by the Commission staff, and the timing of an initial incident report (normally within 10 days) and follow-up reports.

4.11.3 Storage and Retention Systems

LNG storage tanks come in a variety of categories. The following are descriptions of the tank designs most commonly used worldwide:

- single containment cylindrical metal tanks (predominantly used in the United States);
- spherical storage tanks (predominantly used in LNG carriers);
- double containment cylindrical metal inner tank and metal or concrete outer tank (commonly thought of as an LNG tank with a high wall dike);
- full containment cylindrical metal inner tank and metal or concrete outer tank (several authorized by the Commission; several applications currently proposed to the Commission, including this project);
- pre-stressed cylindrical concrete tank with an internal metal membrane (membrane tank) (none in the United States); and
- cryogenic cylindrical concrete tank, internal cryogenic tank, and pre-stressed concrete outer tank (one operational in the United States; the remainder worldwide).

These tank categories are described in Annex H of the European Standard for LNG facilities (EN 1473) and are summarized below for the LNG storage tanks commonly found in proposals before the Commission.

H.1 Single containment tank

A single primary container and generally an outer shell designed and constructed so that only the primary container is required to meet the low temperature ductility requirements for storage of the product.

The outer shell (if any) of a single containment storage tank is primarily for the retention and protection of insulation and to contain the purge gas pressure, but is not designed to contain refrigerated liquid in the event of leakage from the primary container.

An aboveground single containment tank should be surrounded by a bund (dike) wall to contain any leakage. Examples of single containment are depicted on figure H.1.

Figure H.1
Examples of Single Containment Tanks

H.3 Double containment tank

A double containment tank is designed and constructed so that both the inner self-supporting primary container and the secondary container are capable of independently containing the refrigerated liquid stored. To minimize the pool of escaping liquid, the secondary container should be located at a distance not exceeding 6 meters from the primary container.

The primary container contains the refrigerated liquid under normal operating conditions. The secondary container is intended to contain any leakage of the refrigerated liquid, but it is not intended to contain any vapor resulting from this leakage.

Examples of double containment tanks are shown on figure H.3. Figure H.3 does not imply that the secondary container is necessarily as high as the primary container.

H.4 Full containment tank

A full containment tank is designed and constructed so that both the self supporting primary container and the secondary container are capable of independently containing the refrigerated liquid stored and one of them can contain its vapor. The secondary container can be 3 to 6 feet (1 to 2 meters) in distance from the primary container.

The primary container contains the refrigerated liquid under normal operating conditions. The outer roof is supported by the secondary container. The secondary container should be capable both of containing the refrigerated liquid and of controlled venting of the vapor resulting from product leakage after a credible event. Examples of full containment tanks are given on figure H.4.

Single-, double-, and full-containment LNG storage tanks have been authorized by the FERC for use at new LNG import facilities or expansions of existing terminals. To date, only single- and double-containment tanks have been constructed and operated. Several full-containment tanks have started construction in the United States, while approximately 50 have been constructed worldwide. During the review of earlier proposals, a number of issues surfaced concerning the applicability of existing codes and regulations for full-containment tanks. Specifically, the term “full containment” does not appear in the Federal Safety Standards in 49 CFR 193. As a result, some project proponents have made the assumption that to design and construct a full-containment tank in accordance with EN 1473 will satisfy the U.S. codes and standards.

For example, it has been suggested that thermal exclusion zones are not required for a full-containment tank because EN 1473 does not consider a tank fire scenario for full-containment tanks with a pre-stressed concrete wall and concrete roof. The staffs of the FERC and the DOT do not agree because Part 193 does not exclude full-containment tanks from thermal exclusion zone requirements. As a result, a thermal exclusion zone analysis is required for an LNG storage tank fire at the top of the secondary container (see section 4.11.4 *Siting Requirements-Thermal and Dispersion Exclusion Zones*).

Further, EN 1473 does not specify a minimum distance to the property line for full-containment tanks because no tank fire scenario is considered. However, NFPA 59A, 2001 edition, requires a separation of 0.7 times the tank diameter from the property line. NorthernStar’s proposed tank separation distance to the property line meets this separation requirement.

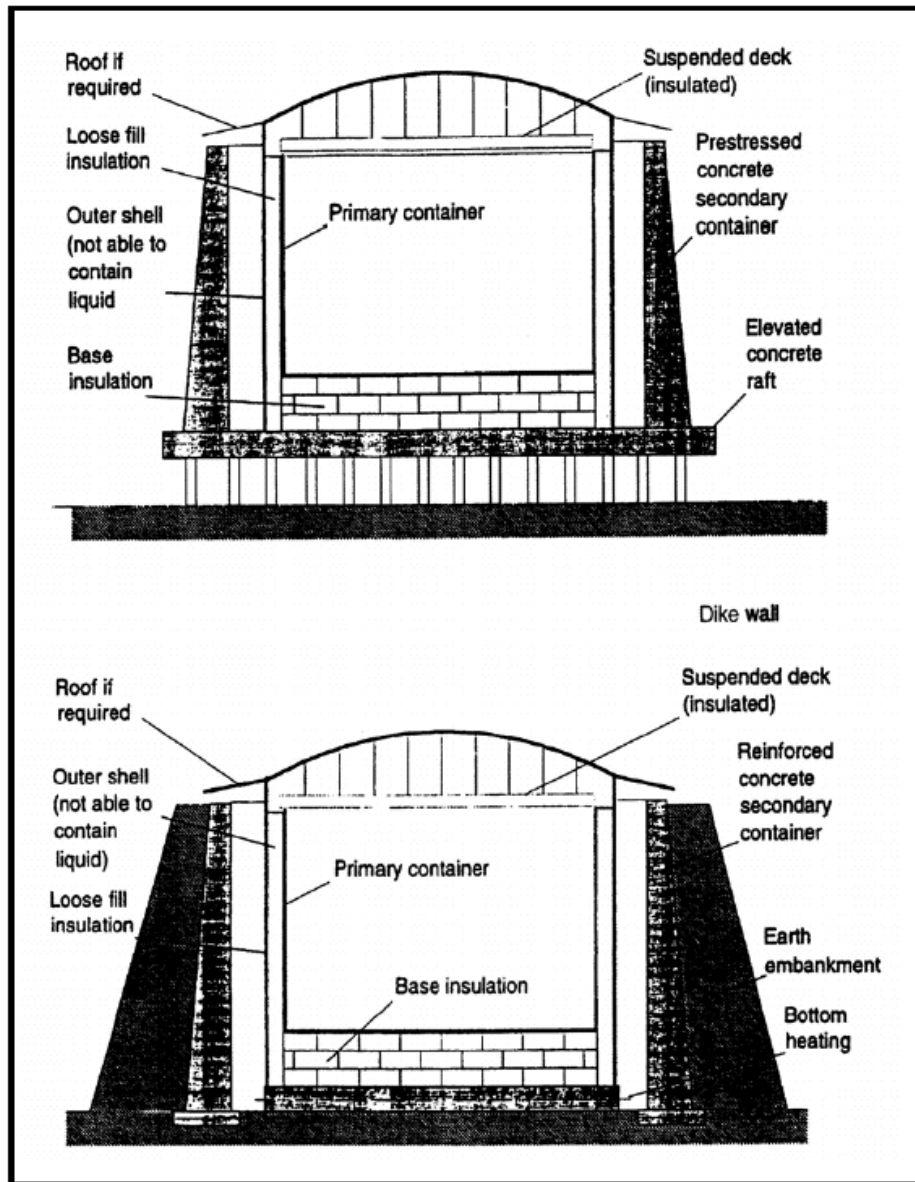

Figure H.3
Examples of Double Containment Tanks

Figure H.4
Examples of Full Containment Tanks

Another issue regarding the full-containment design is that the tank outer wall (secondary containment) serves as the impoundment, a concept allowed under Parts 193.2161 and 193.2167, and under the “exception” on figure 2.2.2.6 of NFPA 59A, 2001 edition. A specific concern is the dual function of the concrete secondary container - it serves both the operational function of holding the insulation and gas pressure, and a safety function of containing liquid in the event of an inner tank failure. Conversely, in single- and double-containment tanks, independent systems provide operational and safety functions. While recognition must be given to the benefits of a concrete secondary container with respect to external events, such as projectiles or small aircraft, its ability to provide the dual functions while retaining its integrity has not been convincingly supported for all scenarios. This becomes increasingly important as proposed site acreage is reduced and buffer zones between adjacent properties are minimized. As such, the FERC staff considers it prudent design practice to provide some form of barrier to prevent liquid from flowing to an unintended area (i.e., outside the plant property) in the event that the storage tank primary and secondary containers fail.

Concerns have also been expressed that the barrier could be considered a containment and prohibit certain equipment being located within the barrier and/or may conflict with other parts of the various codes with respect to hazardous and electrical code classifications. Other concerns are that the barrier could be considered an impounding area that would require new thermal and vapor cloud calculations. The purpose of the barrier is to prevent liquid from flowing off the plant property, and it is not the intent to define a containment or impounding area for thermal radiation or flammable vapor exclusion zone calculations or other code requirements.

NorthernStar proposes to install a tertiary earthen berm around the LNG facility. The structure would be constructed to an elevation of 5 feet above the finished grade level and would enclose the area around the tanks and the process area. The structure's volumetric capacity would contain a single LNG tank's maximum liquid capacity. This berm would confine LNG on the project site in the event of any hypothetical catastrophic event.

4.11.4 Siting Requirements – Thermal and Dispersion Exclusion Zones

Regulatory Requirements

The LNG facilities proposed in this project must comply with the siting requirements of 49 CFR 193, Subpart B. On March 30, 2000, the DOT revised 49 CFR 193 to incorporate the 1996 edition of NFPA 59A into the LNG regulations. On April 9, 2004, the DOT further revised 49 CFR 193 to incorporate the 2001 edition of NFPA 59A. The following sections specifically address siting requirements:

- **Part 193.2001, Scope of part**, excludes any matter other than siting provisions pertaining to marine cargo transfer systems between the marine vessel and the last manifold or valve immediately before a storage tank.
- **Part 193.2051, Scope**, states that each LNG facility designed, replaced, relocated or significantly altered after March 31, 2000, must be provided with siting requirements in accordance with subpart B and NFPA 59A, 2001 edition. In the event of a conflict with NFPA 59A, then Part 193 prevails.
- **Part 193.2057, Thermal radiation protection**, requires that each LNG container and LNG transfer system have thermal exclusion zones based on three radiation flux levels in accordance with section 2.2.3.2 of NFPA 59A, 2001 edition.

- **Part 193.2059, Flammable vapor-gas dispersion protection**, requires that each LNG container and LNG transfer system have a dispersion exclusion zone in accordance with sections 2.2.3.3 and 2.2.3.4 of NFPA 59A, 2001 edition.
- **Part 193.2155(b), Structural requirements**, requires that an LNG storage tank must be at least 1 mile from the ends of an airport runway and 0.25 mile from the nearest point on a runway.

For the following LNG facilities that are proposed in this project, we have identified the applicable siting requirements from Part 193 and NFPA 59A, 2001 edition:

- Two 1,006,000-barrel (160,000 m³) full containment LNG storage tanks - Parts 193.2057 and 2059 require the establishment of thermal and flammable vapor exclusion zones for LNG tanks. NFPA 59A, 2001 edition, section 2.2.3.2 specifies four thermal exclusion zones based on the design spill and the impounding area. NFPA 59A, 2001 edition, sections 2.2.3.3 and 2.2.3.4 specify a flammable vapor exclusion zone for the design spill which is determined with section 2.2.3.5.
- One LNG carrier unloading berth and a marine cargo transfer system consisting of a total of four marine unloading arms, three 16-inch-diameter liquid transfer arms, and one 16-inch-diameter vapor return arm. A 32-inch-diameter transfer line would carry the LNG to the onshore storage tanks - Parts 193.2001, 2057, and 2059 require thermal and flammable vapor exclusion zones for the transfer system. NFPA 59A, 2001 edition, does not address LNG transfer systems.
- Six 2,353 gpm in-tank pumps (three per tank with a spare pump tube); and five 2,398 gpm sendout pumps - Parts 193.2057 and 2059 require thermal and flammable vapor exclusion zones. NFPA 59A, 2001 edition, section 2.2.3.2 specifies the thermal exclusion zone and section 2.2.3.3 and 2.2.3.4 specify the flammable vapor exclusion zone based on the design spill in a process area.
- Seven SCVs - Same requirements as for LNG pumps.

The incorporation of the NFPA 59A requirements into Part 193 has resulted in some confusion and possible misinterpretation in applying the siting requirements. Parts 193.2057 and 2059 require exclusion zones for LNG transfer systems, which are defined to include transfer piping. However, NFPA 59A only requires exclusion zones for “transfer areas” which are defined as the part of the plant where liquids are introduced or removed from the facility such as truck loading or ship unloading areas. The definition of transfer area in NFPA 59A specifically excludes permanent plant piping such as cargo transfer lines. Additionally, NFPA 59A section 2.2.3.1 specifically excludes transfer area at the water edge of marine terminals. When the DOT originally incorporated NFPA 59A into its regulations, it removed the requirement for impounding systems around transfer piping (old Part 193.2149). In the preamble to the final rule, the DOT determined that the most likely sources of leaks within an LNG plant are LNG storage tanks, cargo transfer areas, and vaporizers and process equipment, which are all addressed in NFPA 59A section 2.2.1.2. The result is that while Part 193 retains exclusion zones for LNG transfer systems, neither Part 193 nor NFPA 59A requires the impoundment from which to base the calculations. We do not believe that this was the intent, nor do we believe that omitting containment for transfer piping is a sound engineering practice. The FERC staff will continue to require containment for all LNG transfer piping within a plant site.

The incorporation of NFPA 59A also changed the way in which design spills and impoundment capacities may be determined. Under section 2.2.2.2, the capacity of impounding areas for vaporization, process, or LNG transfer areas must equal the greatest volume during a 10-minute period from any single accidental leakage source or during a shorter time period based upon demonstrable surveillance and shutdown provisions acceptable to the authority having jurisdiction. Similar criteria appear in section 2.2.3.5 for determining the design spill used in thermal and flammable vapor exclusion zone calculations. Prior to the incorporation of NFPA 59A the design spill in Part 193 assumed the rupture of a single transfer pipe with the greatest overall flow capacity, for not less than 10 minutes (old Part 193.2059(d)). As a result, the spill rate for vaporization, process, or LNG transfer areas may be assumed to be a "leakage source" rather than a full pipe rupture; however, the spill duration must be 10 minutes unless the authority having jurisdiction (i.e., DOT's PHMSA), determines that a shorter time is acceptable. Again, given the confusion in applying the two requirements, the FERC staff will continue to utilize the 10-minute spill criterion at the maximum flow possible for containment sizing. This will ensure that impoundments are sized for a catastrophic failure, while recognizing that less conservative spill scenarios may be appropriate to calculate exclusion zones. In giving recognition to the integrity of all-welded transfer piping, the determination of the single accidental leakage source should be based on an evaluation of all small diameter attachments to the transfer piping for instrumentation, pressure relief, recirculation, etc., and any flanges that may be used at valves or other equipment, in order to determine the largest spill rate. This approach is the result of discussion with DOT's PHMSA concerning the basis for design spills and application to exclusion zone determinations for proposals before the Commission.

Impoundment Systems and Design Spills

NorthernStar proposes two full-containment LNG storage tanks in which the outer tank wall serves as the impoundment system. The outer tank would have an impounding volumetric capacity of 50,562,155 gallons, which exceeds the 110 percent requirement by 1,121,891 gallons when accounting for the volume of perlite in the annular space.

The tank and vaporizer area would include the LNG tanks, a portion of the unloading line and recirculation line and the sendout area. An impoundment basin would be located in the tank area and spills from the tank, vaporizer, and unloading line would be routed to the impoundment basin by a series of collection troughs. The largest potential LNG spill volume would be from the unloading line during an unloading operation. A spill from this line over a 10-minute period would result in a spill volume of 529,091 gallons at the maximum unloading rate of 52,834 gpm (12,000 cubic meters per hour (m^3/hr)) accounting for LNG in the piping. This volume was used in the sizing of the tank area impoundment basin. The basin dimensions were designed to be 60 feet by 60 feet by 20 feet which gives an available sump capacity of 538,632 gallons. This spill would be completely contained by the impoundment located in the tank area.

The jetty area would include the larger portion of the unloading and recirculation lines. An impoundment basin would be located in the onshore side of the unloading lines, and spills from the unloading line would be routed to the impoundment basin by a series of collection troughs. The largest potential LNG spill volume would be from the unloading line during an unloading operation. A spill from this line over a 10-minute period would result in a spill volume of 529,091 gallons at the maximum unloading rate of 52,834 gpm (12,000 m^3/hr). This volume was used in the sizing of the jetty area impoundment basin. The basin dimensions were designed to be 60 feet by 60 feet by 20 feet which gives an available sump capacity of 538,632 gallons. This spill would be completely contained by the impoundment located in the jetty area.

Although both the tank area and jetty area sump capacities would be acceptable to contain the spill, the FERC staff has concerns as to whether the collection troughs feeding the sumps, which range from 4-feet wide to 7-feet wide by 1-foot 8-inches high, are adequately sized to handle such a spill.

NorthernStar filed comments on the draft EIS stating that it disagreed that this spill would be the proper design basis for sizing its troughs. NorthernStar attached correspondence between the FERC and DOT which provided clarification on appropriate sizing and design spills.²⁶ NorthernStar incorrectly continues to use the criteria for a “design spill” as a “sizing spill.” As stated in the third paragraph of the FERC’s April 19, 2005 letter, “FERC staff presently uses the greatest overall flow volume for sizing impoundments.” The greatest overall flow volume used for sizing impoundments, and the associated troughs, would be the unloading line rate. As stated above and also in the draft EIS, “the FERC staff will continue to utilize the 10-minute spill criterion at the maximum flow possible for containment sizing.” As a result, **we recommend that:**

- **Prior to initial site preparation, NorthernStar should file with the Secretary for review and written approval by the Director of OEP calculations or a re-designed configuration showing how the troughs feeding the impoundment sumps would adequately handle a spill from the unloading line at the maximum unloading line rate.**

The calculation of thermal and flammable vapor exclusion zones for the proposed LNG facility are based on the dimensions of the proposed spill containment systems and the design spills according to 49 CFR 193 and NFPA 59A, 2001 edition. In accordance with section 2.2.3.5 of NFPA 59A, 2001 edition, the design spill for an LNG storage tank with no penetrations below the liquid level is defined as the largest flow from any single line that could be pumped into the impounding area with the tank withdrawal pumps considered to be operating at full rated capacity over a 10-minute period. In its analysis, NorthernStar modeled a spill of the full flow from a guillotine rupture of the common discharge header of the LNG in-tank pumps. However, NorthernStar included a future third tank in the calculations even though only two tanks were proposed in this application. For the proposed design, the design spill would be a guillotine rupture of the discharge header for the in-tank pumps. Since each pump is rated at 2,353 gpm and there are three pumps per tank, the resulting 10-minute design spill would be 70,590 gallons. This spill would be completely contained by the impoundment located in the tank area.

NFPA 59A, 2001 edition, section 2.2.3.5 also defines design spills for impounding areas serving only vaporization, process, or LNG transfer areas as the flow from any single accidental leakage source for a 10-minute duration. After a review of the piping and instrumentation diagrams for small diameter attachments, the FERC staff determined the design spill for the jetty area sump and tank area sump to be the rupture of a 6-inch-diameter purge line or a 6-inch-diameter recycle line attached to the unloading line. This 10-minute design spill would generate a volume of 140,320 gallons and would be contained in either the jetty area sump or the tank area sump.

The FERC staff also examined spill scenarios from the vaporizer piping, high pressure sendout pump piping, and instrument connections and determined that the full guillotine rupture and 6-inch-diameter attachment design spills were the controlling spills. Table 4.11.4-1 presents the impounding areas and spill size volumes used to determine adequate impounding capacity, as well as the design spills used in the thermal radiation and flammable gas dispersion modeling.

²⁶ The correspondence letters between the FERC and DOT can be found on the FERC’s eLibrary. Document numbers 20050615-0176 and 20050615-0177.

TABLE 4.11.4-1			
Impoundment Areas			
Source	Spill Size (gallons)	Impoundment System	Impoundment Size (gallons)
Impoundment Sizing Spills:			
LNG Storage Tank	45,805,758	Outer Tank Concrete Wall	52,118,481
Unloading Line	529,091	Jetty Area Sump or Tank Area Sump	538,632
Design Spills:			
Tank - Pump Discharge Header	70,590	Tank Area Sump	538,632
Unloading Line - 6-inch connection	140,320	Jetty Area Sump	538,632

We received a comment on the apparent discrepancy between sizes of design spills analyzed for this project and those used in previous proposals. Determination of the design spill is based on a project specific review of the submitted engineering material in accordance with the criteria established in 49 CFR 193. Prior to 2000, the design spill specified by Part 193 for all plant areas resulted from the rupture of a single transfer pipe with the greatest overall flow capacity, discharging at maximum potential capacity. As explained above, the incorporation of NFPA 59A in 2000 altered the design spill definition in 49 CFR 193.

While the design spill for LNG storage tanks is plainly described by NFPA 59A, the design spill in vaporization, process, or LNG transfer areas is specified as a “single accidental leakage source.” However, neither Part 193 nor NFPA 59A provides a definition for this term. As the commentor points out, a wide range of spill sources has been used by applicants in their proposals before the Commission. This range has been from guillotine ruptures of unloading lines to the failure of a 1-inch-diameter instrument connection.

In order to determine appropriate procedures for the selection of the “single accidental leakage source,” FERC staff consulted with the DOT in a letter dated April 19, 2005. As clarified in DOT’s response dated May 5, 2005, the single accidental leakage source would be considered a rupture of a connection to the transfer piping, while the greatest overall flow volume in the area should be used for sizing impoundments. The determination of a single accidental leakage source has been based on facility-specific review of piping and instrumentation diagrams to identify small diameter attachments to the transfer piping for instrumentation, pressure relief, recirculation, etc, and any flanges that may be used at valves or other equipment, in order to determine the largest spill rate. This approach ensures that impoundments are sized for a catastrophic failure that could result from an external event or intentional act, while recognizing that a more likely rupture would be used to calculate flammable vapor exclusion zones. In addition, any event sufficient to create a full breach of large diameter cryogenic piping would likely result in a number of ignition sources which would lead to an LNG pool fire and subsequent radiant heat hazards. Given that impoundments are required to be sized to handle catastrophic failures, radiant heat calculations are dependent on the surface area dimensions of the impoundment rather than on the size of the design spill.

Thermal Exclusion Zone

If a large quantity of LNG is spilled in the presence of an ignition source, the resulting LNG pool fire could cause high levels of radiant heat in the area surrounding the impoundment. Exclusion distances for various flux levels were calculated according to 49 CFR 193.2057 and section 2.2.3.2 of NFPA 59A, 2001 edition, using the "LNGFIRE III" computer program model developed by the Gas Research Institute. NFPA 59A, 2001 edition, establishes certain atmospheric conditions (0 mph wind speed, 70 °F, and 50 percent relative humidity), which are to be used in calculating the distances. However, Part

193.2057 supersedes these requirements and stipulates that wind speed, ambient temperature, and relative humidity which produce the maximum exclusion distances must be used, except for conditions that occur less than 5 percent of the time based on recorded data for the area. For its analysis, NorthernStar selected the following ambient conditions to produce the maximum distances: wind speed of 20 mph, ambient temperature of 37 °F, and 59 percent relative humidity. The FERC staff agrees with the selection of these conditions and these conditions yield longer distances than the 0 mph wind speed, 70 °F ambient temperature, and 50 percent relative humidity specified in NFPA 59A, 2001 edition.

Under 49 CFR 193.2057, the LNG storage tank impoundment must have a thermal exclusion zone in accordance with NFPA 59A, 2001 edition. The referenced section 2.2.3.2 of NFPA 59A, 2001 edition, requires thermal radiation distances ranging from 1,600 to 10,000 British thermal units per square foot per hour (Btu/ft²-hr) to be calculated for a volume of LNG determined in accordance with section 2.2.2.1.

Thermal radiation distances calculated for 1,600 to 10,000 Btu/ft²-hr incident flux levels for an LNG storage tank impoundment fire were based on the outer tank's concrete wall diameter (254 feet) as the pool diameter and the flame height equal to the top of the concrete wall (135.5 feet). The target height was set at ground level (0 feet). The resulting distances would be 377 feet for the 10,000 Btu/ft²-hr zone; 714 feet for the 3,000 Btu/ft²-hr zone; and 912 feet for the 1,600 Btu/ft²-hr zone (see figure 4.11.4-1). However, because the exclusion zones would extend over the Columbia River, a recommendation has been added in section 4.11.6, *Emergency Response and Evacuation Plan*, to ensure that recreational boaters would be warned in the unlikely event that the potential for a fire exists in any of these impoundments.

As required by section 2.2.3.6 of NFPA 59A, 2001 edition, heat flux from a fire over the impounding area would not cause damage to any LNG marine carrier, which would prevent its movement. However, the 10,000 Btu/ft²-hr zone would extend over the proposed relocation of rail track routing within the facility's property line as discussed in section 2.1.3.6. A description of historical, current, and anticipated rail traffic which includes the type of rail traffic (cargo, passenger, etc.), type of cargo, and frequency of all rail traffic that may utilize the railroad tracks adjacent to the facility is provided in section 4.8.2.7. There is currently no traffic on the railroad, and the PWRR has no plans to operate trains west of Wauna. In 2006, a segment of track was washed out west of Bradwood, approximately half-way to Astoria. In response to our recommendation in the DEIS, NorthernStar filed detailed procedures for coordinating with the railroad company to ensure safe rail transit through the Bradwood Landing LNG facility property, which are described in section 4.8.2.7.

In addition, the thermal radiation distances were determined for the 1,600-Btu/ft²-hr incident flux level centered on the tank area sump and jetty area sump. The 1,600 Btu/ft²-hr zone would extend 318 feet from the center of the tank area sump and from the center of the jetty area sump (see figure 4.11.4-1). This zone would not extend past the property line of the site.

The LNG terminal would occupy 40 acres of land within a 411-acre site controlled by NorthernStar, which is largely surrounded by forest. The potential for a forest fire in the area around the LNG terminal would be minimized by an existing forest free buffer zone around the LNG terminal. The forest free buffer zone would be between the 40 acre LNG terminal boundary and the outer boundary of the 411-acre site and is comprised of sparse vegetation which minimizes the risk for a forest fire.

The thermal exclusion zones would remain on the LNG terminal site and would be in compliance with 49 CFR 193.2057. Table 4.11.4-2 presents the maximum distances for incident flux levels ranging from 1,600 to 10,000 Btu/ft²-hr, as calculated by the FERC staff.

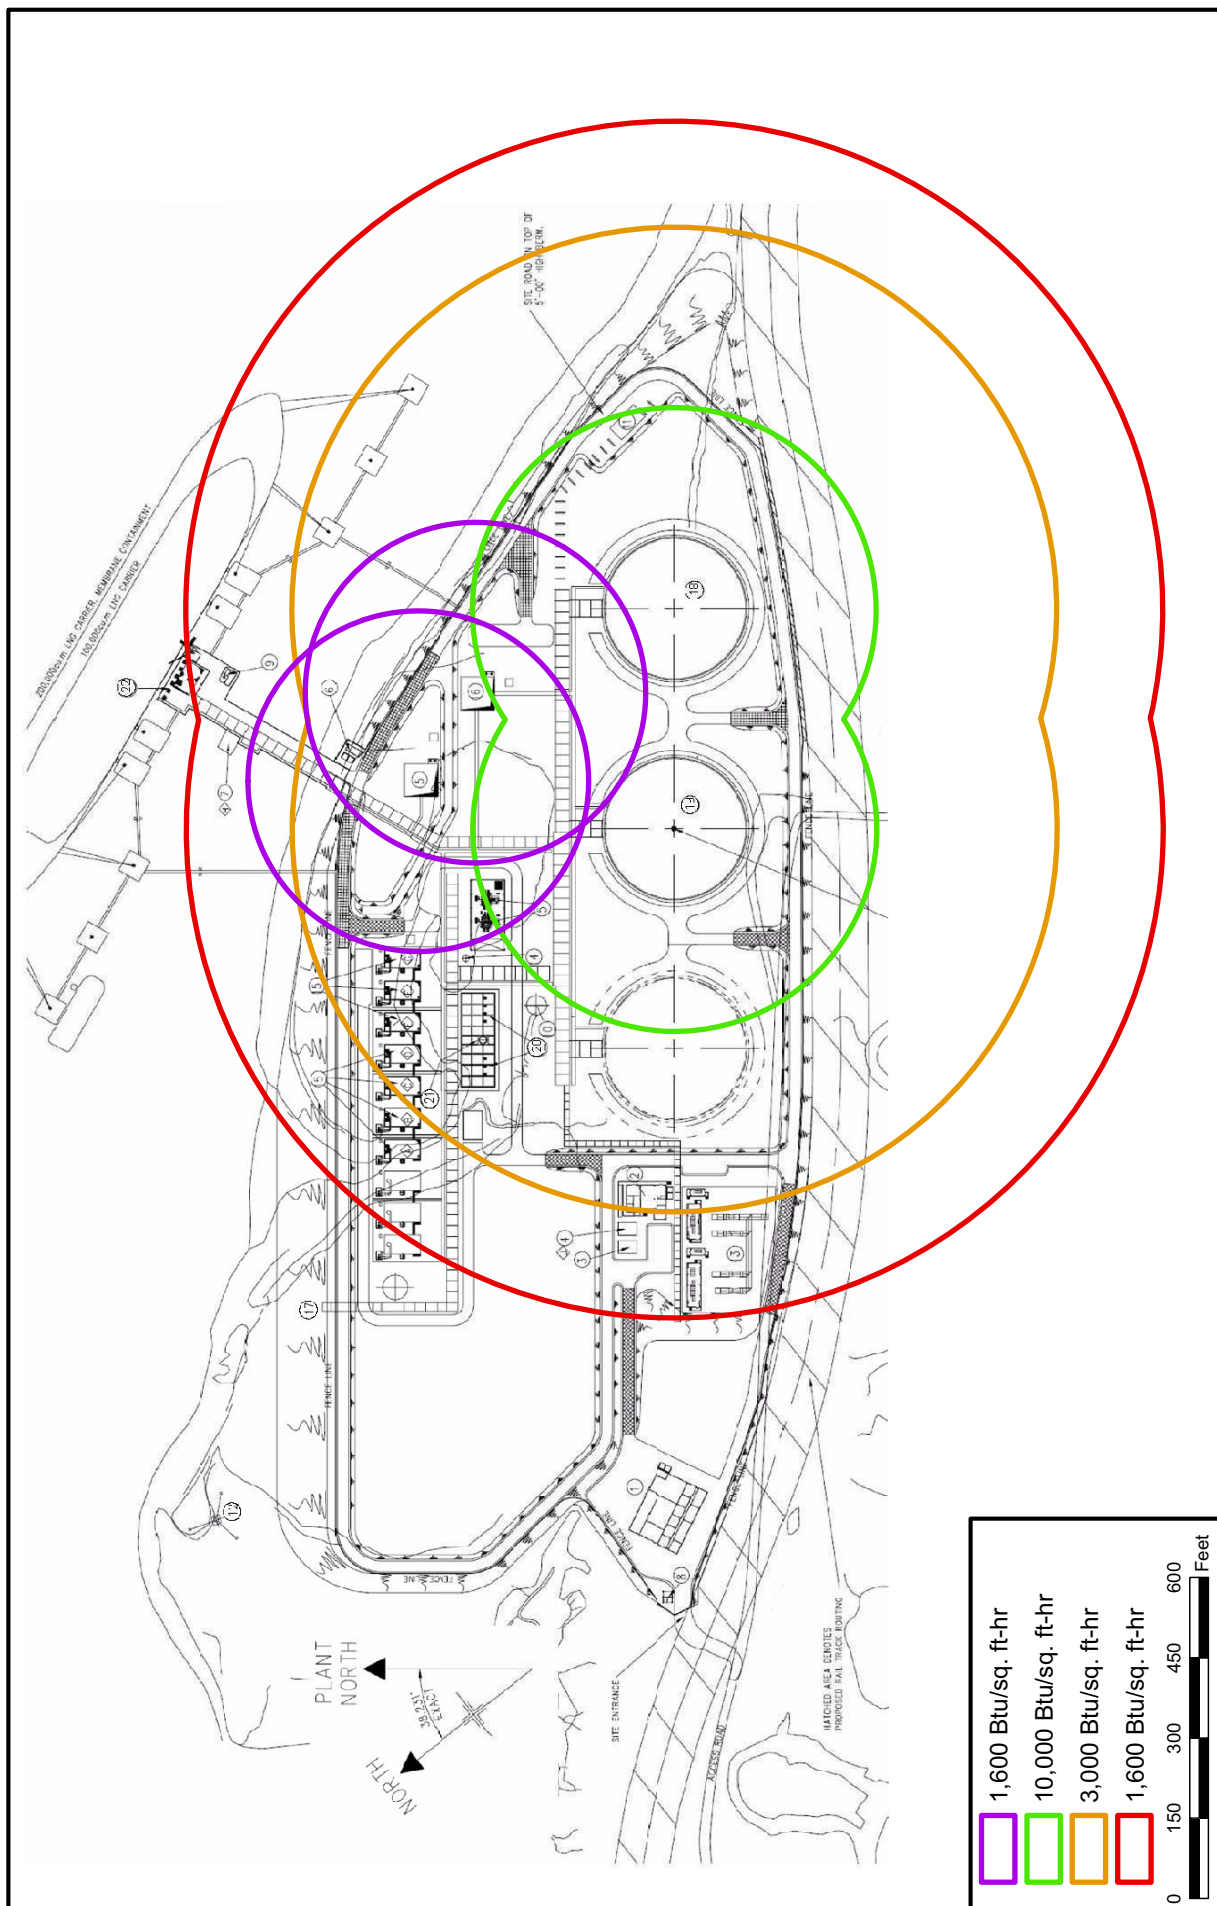

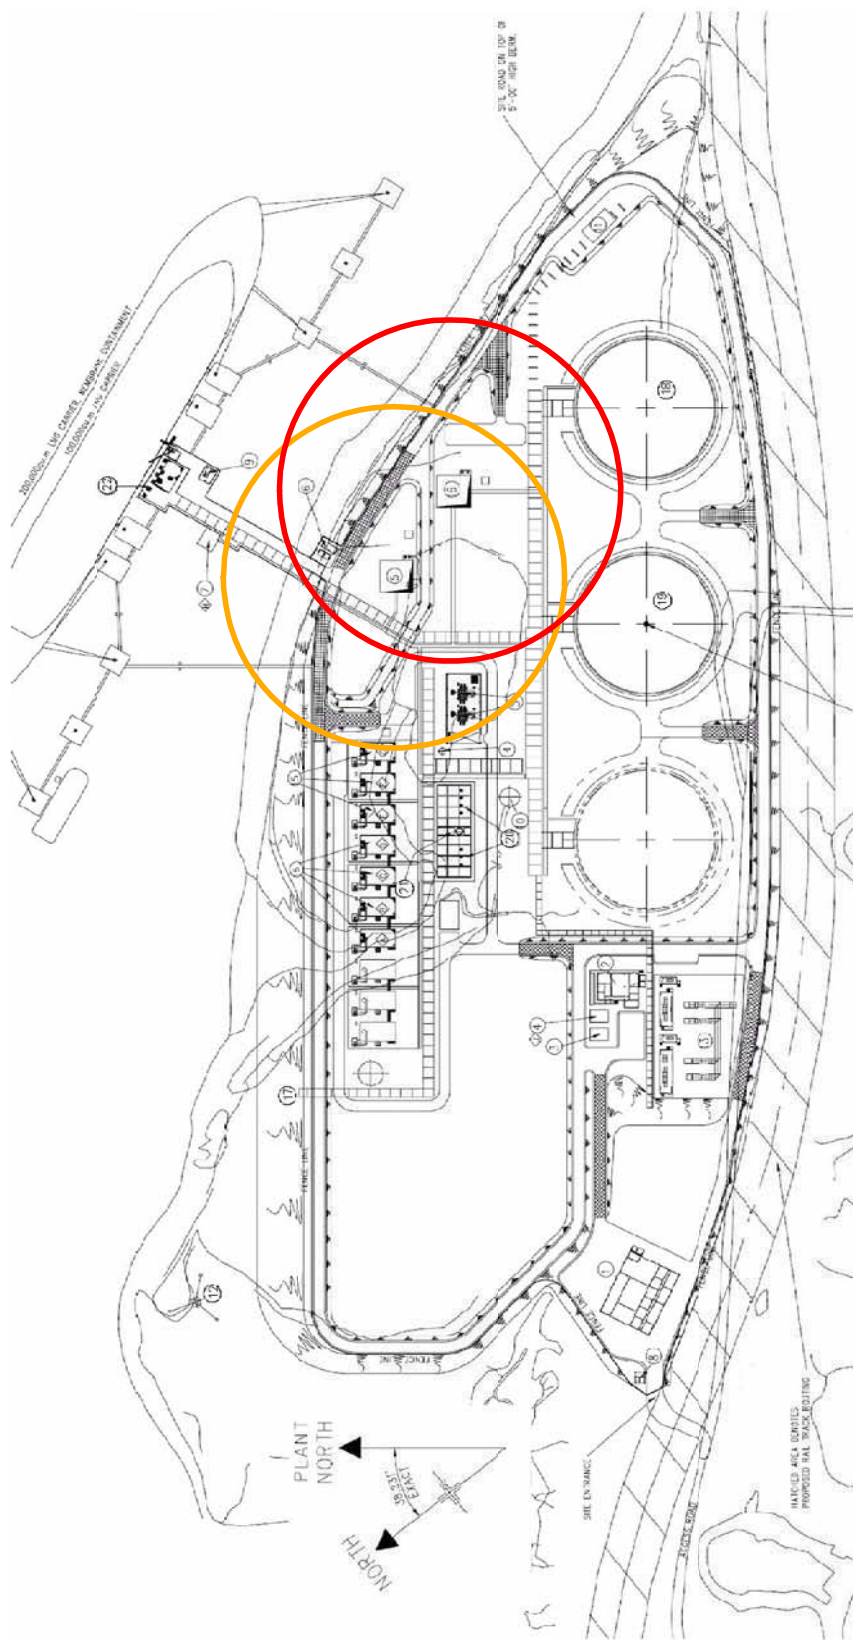

TABLE 4.11.4-2			
Thermal Exclusion Zones			
Source	Exclusion Area NFPA 59A, 2001 edition, section 2-2.3.2(a)	Incident Flux (Btu/ft ² -hr) a	Exclusion Zone (feet)
LNG Storage Tank Impoundment	Outdoor assembly area occupied by 50 or more people.	1,600	912
LNG Storage Tank Impoundment	Off-site structures used for occupancies or residences.	3,000	714
LNG Storage Tank Impoundment	Property line that can be built upon.	10,000	377
Jetty Area Sump and Tank Area Sump	Property line that can be built upon.	1,600	318
^a The 1,600 Btu/ft ² -hr flux level is associated with an exposed person experiencing burns within about 30 seconds. At 3,000 Btu/ft ² -hr, an exposed person would experience burns within 10 seconds; however, a wooden structure would not be expected to burn and affords protection to sheltered persons. At 10,000 Btu/ft ² -hr, clothing and wood can ignite spontaneously.			

Vapor Dispersion Zone

A large quantity of LNG spilled without ignition would form a flammable vapor cloud that would travel with the prevailing wind until it either dispersed below the flammable limits or encountered an ignition source. Sections 2.2.3.3 and 2.2.3.4 of NFPA 59A, 2001 edition, and Part 193.2059 require that provisions be made to minimize the possibility of flammable vapors reaching a property line that can be built upon and that would result in a distinct hazard. Part 193.2059 requires that dispersion distances be calculated for a 2.5 percent average gas concentration (one-half the lower flammability limit (LFL) of LNG vapor) under meteorological conditions which result in the longest downwind distances at least 90 percent of the time. Alternatively, maximum downwind distances may be estimated for stability Class F, a wind speed of 4.5 mph, 50 percent relative humidity, and the average regional temperature. The section allows the use of the DEGADIS (Dense Gas Dispersion Model), or the FEM3A model, to compute dispersion distances. Design spills into impounding areas serving LNG containers, transfer systems, and piping are to be determined in accordance with section 2.2.3.5 of NFPA 59A, 2001 edition. In accordance with section 2.2.3.3 of NFPA 59A, 2001 edition, an average concentration of methane in air of one-half of the LFL cannot cross the property line from a design spill into each tank impoundment. In this case, compliance with section 2.2.3.3 would also meet the requirements of section 2.2.3.4 of NFPA 59A, 2001 edition.

In performing the vapor dispersion analysis required by 49 CFR 193.2059, NorthernStar selected a wind speed of 4.5 mph, an atmospheric temperature of 52 °F, a relative humidity of 50 percent, and atmospheric stability Class F. The FERC staff agrees with the selection of these conditions. As discussed previously in section 4.11.4, the design spill for the jetty area sump and tank area sump would be the rupture of a 6-inch-diameter purge line or the rupture of a 6-inch-diameter recycle line attached to the unloading line. This 10-minute design spill would generate a volume of 140,320 gallons and would be contained in either the jetty area sump or the tank area sump. In its application, NorthernStar used SOURCE5 to determine the source strength and equivalent radius of the design spill. NorthernStar provided thermal properties of the proposed sumps which are as follows: thermal conductivity of 0.32 W/M K; density of 801 kg/m³; and a heat capacity of 790 J/kg K. The output source strength and equivalent radius from SOURCE5 were inputted into DEGADIS using the atmospheric properties described above. This spill would result in a distance of 325 feet to the 2.5 percent average gas concentration isopleths (see figure 4.11.4-2). The distance of 243 feet reported in the draft EIS was a typographical error and is incorrect.

Jetty Area Sump

Figure 4.11.4-2
Bradwood Landing Project
 Vapor Dispersion Zones

Although the flammable vapor dispersion exclusion zones associated with these design spills would extend off-site into the navigation channel, there are no prohibited land uses within them. Subsequently, the proposed terminal location would satisfy the vapor exclusion zone requirements of 49 CFR 193.2059. However, because the exclusion zone would extend over the Columbia River, a recommendation has been added in section 4.11.6, *Emergency Response and Evacuation Plan*, to ensure that recreational boaters would be warned in the unlikely event that LNG vapor may disperse over the waterway.

We received a comment that a 4.5 mph (2.0 m/s) wind speed is not conservative with the use of DEGADIS and that the vapor dispersion methodology cannot account for obstructions to the vapor flow or any holdup of LNG vapor by either the dock area or tank area sumps. The vapor dispersion and source calculations were done in accordance with the regulations under 49 CFR 193 and are consistent with methodologies in the May 28, 1982 and June 29, 1983 Formal Interpretations by the DOT regarding vapor dispersion distances and vapor holdup/scooping. For the DEGADIS model, longer downwind vapor dispersion distances are produced at lower wind speeds. Using wind speeds higher than 4.5 mph (2 m/s) would reduce the downwind dispersion distances in DEGADIS, resulting in a less conservative result. In addition, higher wind speeds generally correspond to more atmospheric instability, which will further reduce the downwind dispersion distance.

While DEGADIS cannot depict terrain and actual geometries, calculations that take into account the obstruction of flow, such as from storage tanks and the earthen berm, would result in shorter dispersion distances due to enhanced turbulent mixing in the wake of such structures. The source strength methodology does not account for “wind scooping” and vapor expansion effects that may produce higher initial source strengths and longer dispersion distances. To investigate the possible effects to the calculations, FERC staff adjusted the vapor production model to eliminate all vapor retention and used the resulting source production curve as input to DEGADIS. Although the downwind distance to the one-half LFL would be larger using this method, it would still not extend beyond the facility property line onto any adjacent land.

4.11.5 LNG Carrier Safety

Since 1959, LNG has been transported by ship without a major release of cargo or a major accident involving an LNG carrier. Over the last 45 years, LNG carriers have made over 44,000 voyages worldwide. Starting in 1971, LNG began arriving at the Distrigas facility in Everett, Massachusetts. To date, more than 680 cargoes, with volumes ranging from 60,000 to 138,000 m³, have been delivered into the Port of Boston without incident. During 2005, a total of 275 cargoes of LNG were imported into the United States. During 2006, 226 cargoes of LNG were imported into the United States. For 36 years, LNG shipping operations have been safely conducted in the United States.

4.11.5.1 History

During the more than 44,000 voyages that have been completed since the inception of LNG maritime transportation, there has not been a serious accident at sea or in a port which resulted in a spill due to rupturing of the cargo tanks. However, insurance records, industry sources, and public websites identify a number of incidents involving LNG carriers, including minor collisions with other vessels of all sizes, groundings, minor LNG releases during cargo unloading operations, and mechanical/equipment failures typical of large vessels. Some of the more significant LNG carrier incidents are described below:

Pollenger had an LNG spill onto the steel cover of cargo tank number one during unloading at Everett, Massachusetts in April 1979. The spill caused cracking of the steel plate.

El Paso Paul Kayser grounded on a rock in June 1979 in the Straits of Gibraltar during a loaded voyage from Algeria to the United States. Extensive bottom damage to the ballast tanks resulted; however, the cargo tanks were not damaged, and no cargo was released. The complete cargo of LNG was subsequently transferred to another LNG carrier and delivered to its United States destination.

LNG Taurus grounded in December 1980 near the entrance to Taboata Harbor, Japan. The grounding resulted in extensive bottom damage, but the cargo tanks were not affected. The ship was refloated and the cargo unloaded.

Isabella had LNG spill onto its deck due to a cargo tank overflow in June 1985, causing severe cracking of the steelwork. The spill had been attributed to a cargo valve failure during discharging of cargo.

Tellier was blown by severe winds from its docking berth at Skikda, Algeria in February 1989 causing damage to the loading arms and the ship and shore piping. The cargo loading had been secured just before the wind struck, but the loading arms had not been drained. Consequently, the LNG remaining in the loading arms spilled onto the deck causing fracture of some plating.

Mostefa Ben Boulaid had LNG spill onto its deck during loading operations in Algeria in 2002. The spill, which is believed to have been caused by overflow rather than a mechanical failure, caused significant brittle fracturing of the steelwork. The ship was required to discharge its cargo, after which it proceeded to dock for repair.

Khannur had a cargo tank overfill into the ship's vapor handling system on September 10, 2001, during unloading at Everett, Massachusetts. Approximately 100 gallons of LNG were vented and sprayed onto the protective decking over the cargo tank dome, resulting in several cracks. After re-inspection by the Coast Guard, the Khannur was allowed to discharge its LNG cargo.

Norman Lady was struck by the USS Oklahoma City nuclear submarine while the submarine was rising to periscope depth near the Strait of Gibraltar in November 2002. The 87,000-m³ LNG carrier, which had just unloaded its cargo at Barcelona, Spain, sustained only minor damage to the outer layer of its double hull but no damage to its cargo tanks.

Tenaga Lima grounded on rocks while proceeding to open sea east of Mopko, South Korea due to strong current in November 2004. The shell plating was torn open and fractured over an approximate area of 20 feet by 80 feet, and internal breaches allowed water to enter the insulation space between the primary and secondary membranes. The ship was refloated, repaired, and returned to service.

Golar Freeze moved away from its docking berth during unloading on March 14, 2006, in Savannah, Georgia. The powered emergency release couplings on the unloading arms activated as designed, and transfer operations were shut down.

Catalunya Spirit lost propulsion and became adrift 35 miles east of Chatham, Massachusetts on February 11, 2008. Four tugs towed the vessel to a safe anchorage for repairs. The Catalunya Spirit was repaired and taken to port to discharge its cargo.

4.11.5.2 LNG Carrier Construction

In 1980, at the initial peak of LNG import activity in the United States, the Coast Guard published the report *Liquefied Natural Gas and Liquefied Petroleum Gas – Views and Practices – Policy and Safety*. The report summarized the Coast Guard's extensive research into the safety hazards of LNG

and its view that “...the nature of both LNG and liquid petroleum gas (LPG) presents an acceptable risk for transportation in maritime commerce.” This is due to the fact that LNG carriers are well constructed, robust vessels designed to withstand low-energy-type incidents that are prevalent in harbors and during docking operations. Moreover, safety measures, both equipment and training, are planned and designed into these LNG carriers to prevent or control all types of potential incidents. The Sandia National laboratory reached a similar conclusion in 2005 in its report.

The world’s LNG carrier fleet currently exceeds 218 carriers. Currently, all of the ships in the LNG fleet operate under a foreign flag with foreign crews. The LNG carriers used to import LNG to the United States would be constructed and operated in accordance with the IMO’s *Code for the Construction and Equipment of Ships Carrying Liquefied Gases in Bulk*, the SOLAS, and 46 CFR Part 154, which contain the U.S. safety standards for vessels carrying bulk liquefied natural gas. Foreign flag LNG carriers are required to possess a valid IMO Certificate of Fitness and a Coast Guard COC.

As required by the IMO conventions and design standards, hold spaces and insulation areas on an LNG carrier are equipped with gas detection and low temperature alarms. These devices monitor for leaks of LNG into the insulation between primary and secondary LNG cargo tank barriers. In addition, hazard detection systems are also provided to monitor the hull structure adjacent to the cargo tank, compressor rooms, motor rooms, cargo control rooms, enclosed spaces in the cargo area, specific ventilation hoods and gas ducts, and air locks.

LNG carriers are equipped with a firewater system with the ability to supply at least two jets of water to any part of the deck in the cargo area and parts of the cargo containment and tank covers above-deck. A water spray system is also available for cooling, fire prevention, and crew protection in specific areas. Furthermore, certain areas of LNG carriers are fitted with dry chemical powder-type extinguishing systems and CO₂ smothering systems for fighting fires.

In 1993, amendments to the IMO’s *Code for the Construction and Equipment of Ships Carrying Dangerous Chemicals in Bulk* require all tankers to have monitoring equipment with an alarm facility which is activated by detection of over-pressure or under-pressure conditions within a cargo tank. In addition, the cargo tanks are heavily instrumented, with gas detection equipment in the hold and inter-barrier spaces, temperature sensors, and pressure gauges. See section 2.1.1.7 for further discussion.

As a result of the terrorist attacks that occurred on September 11, 2001, the IMO agreed to new amendments to the 1974 SOLAS addressing port facility and ship security. The *International Ship and Port Facility Security (ISPS) Code* was adopted in 2003 by the IMO. This code requires both ships and ports to conduct vulnerability assessments and to develop security plans. The purpose of the code is to prevent and suppress terrorism against ships; improve security aboard ships and ashore; and reduce the risk of passengers, crew, and port personnel on board ships and in port areas, for vessels and cargoes. All LNG carriers as well as other cargo vessels 300 gross tons and larger, and ports servicing those regulated vessels, must adhere to these IMO and SOLAS standards. Some of the IMO requirements are as follows:

For ships:

- Ships must develop security plans and have a Vessel Security Officer (VSO);
- Ships must be provided with a ship security alert system. These alarms transmit ship-to-shore security alerts to a competent authority designated by the Administration, which may include the company, identifying the ship, its location, and indication that the security of the ship is under threat or has been compromised;

- Ships must have a comprehensive security plan for international port facilities, focusing on areas having direct contact with ships; and
- Ships may have certain equipment onboard to help maintain or enhance the physical security of the ship.

For port facilities:

- Ports must develop a port facility security plan and have a Facility Security Officer (FSO); and
- Certain security equipment may be required to maintain or enhance the physical security of the facility.

For both ships and ports:

- Access must be monitored and controlled;
- Activities of people and cargo must be monitored;
- Security of communications and that they are readily available must be ensured; and
- A Declaration of Security must be completed and signed by the FSO and VSO.

4.11.5.3 Hazards

The history of LNG shipping has been free of major incidents, and none have resulted in significant quantities of cargo being released (see section 4.11.5.1). No incidents have occurred at existing LNG terminals during the 50 years of operation that resulted in any significant quantities of cargoes being released. However, the possibility of an LNG spill from a ship over the duration of the proposed project must be considered. If an LNG spill were to occur, the primary hazard to the public would be the impact of radiant heat from a pool fire. If an LNG release were to occur without ignition, an ignitable gas cloud could form and present a hazard. This section presents the results of analyses specific to LNG carriers to determine distances for these hazards, and describes how the hazard distances would be managed if the Project is approved.

Historically, the events most likely to cause a significant release of LNG were a ship casualty such as:

- a grounding sufficiently severe to puncture an LNG cargo tank;
- a vessel colliding with an LNG carrier in transit;
- an LNG carrier alliding²⁷ with the terminal or a structure in the waterway; or
- a vessel alliding with an LNG carrier while moored at the terminal.

However, the attacks on September 11, 2001, have made the public keenly aware of an additional risk that must be considered in the evaluation of marine safety and security:

- a deliberate attack on an LNG carrier by a terrorist group.

To result in a spill of LNG, any of the above events would need to occur with sufficient impact to breach an LNG carrier's double hull and cargo tanks. All LNG carriers used to deliver LNG to the proposed project would have double-hull construction, with the inner and outer hulls separated by about

²⁷ "Alliding" is the action of dashing against or striking upon a stationary object (for example, the running of one ship upon another ship that is docked) – distinguished from "collision," which is used to refer to two moving ships striking one another.

10 feet. Furthermore, the cargo tanks are normally separated from the inner hull by a layer of insulation approximately 1-foot thick.

As a result, many grounding incidents severe enough to cause a cargo spill on a single-bottom oil tanker would be unable to penetrate both inner and outer hulls of an LNG carrier. An earlier Federal Power Commission (FPC) (predecessor to the FERC) study estimated that the double-bottom of an LNG carrier would be sufficient to prevent cargo tank penetration in about 85 percent of the cases that penetrated a single-bottom oil tanker. Previous incidents with LNG carriers have primarily involved grounding, and none of these have resulted in the breach of the double hull and subsequent release of LNG cargo.

The probability of an LNG carrier sustaining cargo tank damage in a collision would depend on several factors – the displacement and construction of both the struck and striking vessels, the velocity of the striking vessel and its angle of impact with the struck vessel, and the location of the point of impact. The previous FPC study estimated that the additional protection afforded by the double hull would be effective in low-energy collisions; overall, it would prevent cargo tank penetration in about 25 percent of the cases that penetrated a single-hull oil tanker.

In 1995, to assist the Coast Guard in San Juan, Puerto Rico, EcoEléctrica L.P. prepared an analysis of the damage that could result from an oil tanker striking an LNG carrier at berth (FERC, 1996). The analysis assumed a 125,000 m³ LNG carrier and an 82,000-dead-weight-ton tanker carrying number 6 fuel oil without tug assistance. The analysis determined the minimum striking speed to penetrate the cargo tanks of an LNG carrier for a range of potential collision angles. The resulting minimum striking speeds are presented in table 4.11.5-1 for the two principal cargo systems.

TABLE 4.11.5-1		
Minimum Striking Speed to Penetrate LNG Cargo Tanks		
Angle of Impact	Minimum Striking Speed (knots)	
	Spherical Tanks	Membrane Tanks
Greater than 60 degrees	4.5	3.0
45 degrees	6.3	4.0
30 degrees	9.0	6.0
15 degrees	18.0	12.0

For membrane tanks, the critical beam-on striking speed is 3.0 knots; for spherical tanks, the critical beam-on speed is 4.5 knots. For both containment types, lower angles of impact result in much greater minimum striking speeds to penetrate LNG cargo tanks. In the July/August 2002 issue of *LNG Journal*, the Society of International Gas Tanker & Terminal Operators General Manager provides a table that indicates the critical speed necessary for a 20,000-ton vessel to puncture the outer hull of an LNG carrier is 7.3 knots. For a 93,000-ton ship, the impact speed is 3.2 knots. In neither case does such an impact result in damage to the LNG cargo containment system, nor does it result in release of LNG.

The Sandia Report included an LNG cargo tank breach analysis using modern finite element modeling and explosive shock physics modeling to estimate a range of breach sizes for both credible accidental and intentional LNG spill events. The analysis of accidental events found that groundings, collisions with small vessels, and low-speed (less than 7 knots) collisions with large vessels striking at 90 degrees could cause minor ship damage but would not result in a cargo spill. This is due to the protection provided by the double-hull structure, the insulation layer, and the primary cargo tank of an LNG carrier.

High-speed (12 knots) collisions with large vessels striking at 90 degrees were found to potentially cause cargo tank breach areas of 0.5 to 1.5 m².

In the event of a collision or allision of sufficient magnitude to rupture an LNG cargo tank, it is likely that sparks or flames would ignite the flammable vapors at the spill site. In a grounding of sufficient magnitude to rupture an LNG cargo tank, the damage would occur underwater, and the potential for ignition would be less than for collisions or allisions. In this case, an LNG spill would rapidly vaporize on water and form a potentially flammable cloud. If not ignited, the flammable vapor cloud would drift downwind until the effects of dispersion would dilute the vapors below the LFL for methane. The maximum range of potentially flammable vapors, or the distance to the LFL, is a function of the volume of LNG spilled, the rate of the spill, and the prevailing meteorological conditions. If the flammable vapor cloud encountered an ignition source, the cloud would burn back to the spill site.

The final EIS for the Calcasieu LNG Project (FERC, 1976) analyzed the maximum range of a flammable vapor cloud and hazardous radiation levels from an instantaneous one-tank spill. As was consistent with risk analyses at that time and for nearly 25 years thereafter, the instantaneous spillage of one cargo tank was considered to be the “worst-case” scenario. Physical constraints on maximum vessel speeds and maximum depths of penetration required to rupture one LNG cargo tank render the possibility of an instantaneous release of more than one cargo tank to be implausible. This is not to imply that the loss of multiple cargo tanks could never occur, but that the extent of the hazard would not exceed that of the instantaneous spillage of one tank.

For an instantaneous one-tank spill with ignition, the final EIS for the Calcasieu LNG Project estimated that a hazardous thermal radiation level of 5,300 Btu/ft²-hr would extend 3,595 feet from the center of the spill. For an instantaneous one-tank spill without ignition, the final EIS for the Yukon Pacific LNG Project (FERC, 1995) estimated that potentially flammable vapors could travel up to 3.3 miles, with a 10-mph wind and typical atmospheric stability.

In October 2001, the use of a one-tank instantaneous release as the worst-case scenario was reexamined by Quest Consultants, Inc (Quest) as part of an effort by the DOE to determine the hazards associated with reopening the Distrigas LNG import terminal following the terrorist attacks of September 11, 2001. It was determined that time-release spills through 1-meter and 5-meter diameter holes would more accurately simulate credible worst-case damage scenarios. The maximum flammable vapor cloud and radiation hazards were calculated for the two spill scenarios. For a spill on water with ignition, the maximum distance to a radiant flux level of 1,500 Btu/ft²-hr was estimated to be 1,770 feet. For a spill on water without ignition, a flammable vapor cloud of 2.5 miles was estimated. In November 2003, in response to comments concerning its October 2001 study, Quest clarified that its study applied only to LNG spills resulting from a collision with a large ship in Boston’s Outer Harbor, where waves would restrict the spreading of LNG on water.

Since the Quest study, there has been an emergence of studies by various parties to define the worst-case scenario that would result from a deliberate terrorist attack on an LNG carrier and the subsequent release of cargo. Distances have been estimated to range from 1,770 to 4,200 feet for a thermal radiation level of 1,500 Btu/ft²-hr. Part of the reason for the apparent discrepancies is the lack of large-scale historical incidents, and the need to extrapolate small-scale field test data to a worst-case event. This inevitably leads to differing conservative assumptions among the various parties. For example, some models calculate a time-release cargo discharge through 1-meter or 5-meter diameter holes, while others assume that the cargo tank empties instantaneously.

As a result, the FERC commissioned a study by ABSG to search and review the literature on experimental LNG spills and on consequence methodologies that are applicable to modeling incidents of

LNG spills on water. Further, the goal of the study was to identify appropriate methods for estimating flammable vapor and thermal radiation hazard distances for potential LNG carrier cargo releases during transit and while at berth. The resulting study, *Consequence Assessment Methods for Incidents Involving Releases from Liquefied Natural Gas Carriers*, was released for public comment on May 14, 2004. On June 18, 2004, the FERC staff's responses to comments on the consequence assessment methods were issued. In addition, the model was updated to include a lower limit on the characteristic wind speed. As discussed in greater detail in the staff's responses, various components of the consequence assessment methodologies were revised based on comments received. The revised methodology provides procedures for calculating: (1) the rate of release of LNG from a cargo tank penetration for various-sized holes; (2) the spreading of an unconfined LNG pool on water for both continuous spills and rapid (nearly instantaneous) releases; (3) the rate of vapor generation from an unconfined spill on water; (4) thermal radiation distances for LNG pool fires on water; and (5) flammable vapor dispersion distances.

A detailed evaluation of the consequences of a terrorist attack on a modern membrane LNG carrier was prepared by Lloyds Register North America for the Weaver's Cove LNG Project. The study evaluated the consequences of attacks on an LNG carrier by missiles and explosives. Finite element analysis was used to evaluate the effect of various-sized charges on both the outer and inner hulls. A 1-meter diameter hole of the inner hull at the waterline was found to be the worst-case scenario for hazard consequence assessments. This finding is consistent with the attack on the double-hull oil tanker *Limberg* which caused greater than a 5-meter diameter hole on the outer hull, but only minor damage to the inner hull. A failure modes and effects analysis was used to understand internal LNG release characteristics, and a residual strength analysis was used to investigate damage scenarios for a loaded LNG tanker.

As discussed above, the Sandia Report included an LNG cargo tank breach analysis, using modern finite element modeling and explosive shock physics modeling to estimate a range of breach sizes for credible accidental and intentional LNG spill events. For intentional scenarios, the size of the cargo tank hole depends on the location of the ship and source of threat. Intentional breach areas were estimated to range from 2 to 12 m². In most cases, an intentional breaching scenario would not result in a nominal hole of more than 5 to 7 m², which is a more appropriate range to use in calculating potential hazards from spills. These hole sizes are equivalent to circular hole diameters of 2.5 and 3 meters.

The Sandia Report also included guidance on risk management for intentional spills, based on the findings that the most significant impacts to public safety and property exist within approximately 500 meters (1,640 feet) of a spill due to thermal hazards from a fire, with lower public health and safety impacts beyond 1,600 meters (approximately 1 mile). Large unignited LNG vapor releases were found to be unlikely, but could extend from nominally 2,500 meters (8,200 feet) to a conservative maximum distance of 3,500 meters (11,500 feet) for an intentional spill.

Cascading damage due to brittle fracture from exposure to cryogenic liquid or fire-induced damage to foam insulation was evaluated in the Sandia Report and, while possible under certain conditions, is not likely to involve more than two or three cargo tanks. Cascading events are not expected to increase the overall fire hazard by more than 20 to 30 percent (1,920 to 2,080 meters (6,300 to 6,825 feet)) but would increase the expected fire duration. RPTs are possible for large spills, but the effects would be localized near the spill source and should not cause extensive structural damage.

In February 2007, the U.S. General Accounting Office (GAO) published a report (GAO, 2007) that assessed recent studies, including the Sandia study, that have been conducted on the consequences of an LNG spill resulting from a terrorist attack on an LNG carrier. The GAO's panel of experts agreed that the most likely public safety impact of an LNG spill would be the radiant heat from a pool fire. Although the GAO report characterizes disagreements among the panel of experts, the majority felt the Sandia calculations were either accurate or overly conservative. The Sandia Report concluded that damage due

to brittle fracture from exposure to cryogenic liquid or fire-induced damage was possible under certain conditions and would increase the duration of the event. The majority of the GAO expert panel agreed with Sandia that cascading events are not expected to significantly increase the overall fire hazard. The disagreement cited in the GAO report concerned the need for future research and clarifying uncertainties, rather than the Sandia's conclusions on cascading failures.

As part of the waterway suitability review process, the Coast Guard uses criteria developed by Sandia to define the outer limits of the hazard zones for assessing potential risks associated with the proposal. The Sandia analysis was based on LNG vessels of 148,000 m³. Therefore, the proposed Zones of Concern are based on the assumption that LNG vessels traveling to the Bradwood LNG terminal would have capacities of no greater than 148,000 m³. Should NorthernStar wish to receive larger LNG vessels in the future, the Sandia Report would have to be revisited to determine any changes to the Zones of Concern, the WSA/WSR would have to be reviewed to determine if the safety and security measurements are adequate to accommodate the larger LNG vessels, and supplemental review would be required. The Zones of Concern used in the waterway review were:

- Zone 1 – impacts on structures and organisms are expected to be significant within 500 meters (1,640 feet). The outer perimeter of Zone 1 is the distance to thermal hazards of 37.5 kW/m² from a pool fire.
- Zone 2 – impacts would be significant but reduced, and damage from radiant heat levels are expected to transition from severe to minimal between 500 and 1,600 meters (1,640 and 5,250 feet). The outer perimeter of Zone 2 is the distance to thermal hazards of 5 kW/m² from a pool fire.
- Zone 3 – impacts on people and property from a pool fire or an unignited LNG spill that does not ignite are expected to be minimal between 1,600 meters (5,250 feet) and a conservative maximum distance of 3,500 meters (11,500 feet). The outer perimeter of Zone 3 should be considered the vapor cloud dispersion distance to the LFL from a worst case unignited release. Impacts to people and property could be significant if the vapor cloud reaches an ignition source and burns back to the source.

The severity of impacts within Zones 1 through 3 would depend on the location of the incident relative to a specific area, the scope of the incident, and whether the released LNG ignited or dispersed. This could be a significant impact, being most severe in Zone 1 and decreasing outward through Zones 2 and 3. However, because of the implementation of safety and security measures during marine transit, the likelihood of a marine LNG spill is remote and an unlikely event.

Based on the breach sizes identified in the Sandia Report, the methodology described in the ABSG study, and revised in the FERC staff's responses to comments, was also used to calculate the thermal radiation and flammable vapor dispersion distances. In the case of the penetration of the largest cargo tank of a 140,000-m³ LNG carrier, a potential spill of 23,000 m³ is estimated for the volume of LNG above the waterline. The estimated pool spread results and thermal radiation hazard distances are identified in table 4.11.5-2 below. Thermal radiation calculations are based on an ambient temperature of 52 °F, a relative humidity of 50 percent, and an 18-mph wind speed.

TABLE 4.11.5-2					
LNG Spills on Water (using ABSG Methodology)					
LNG Release and Spread					
Hole Area	0.8 m ²	1.5 m ²	5 m ²	7 m ²	12 m ²
Hole Diameter	1.0 m	1.4 m	2.5 m	3.0 m	3.9 m
Spill Time	94.0 minutes	48.0 minutes	15.0 minutes	10.4 minutes	6.2 minutes
Pool Fire Calculations					
Maximum Pool Radius	341 feet	476 feet	817 feet	938 feet	1,102 feet
Fire Duration	94.1 minutes	48.1 minutes	15.2 minutes	10.7 minutes	6.5 minutes
Distance to:					
1,600 Btu/ft ² -hr	2,154 feet	2,777 feet	4,163 feet	4,630 feet	5,225 feet
3,000 Btu/ft ² -hr	1,675 feet	2,150 feet	3,205 feet	3,560 feet	4,013 feet
10,000 Btu/ft ² -hr	1,013 feet	1,289 feet	1,902 feet	2,108 feet	2,371 feet

Flammable vapor dispersion calculations were based on an atmospheric temperature of 52 °F, 50 percent relative humidity, a 4.5-mile per hour wind speed and atmospheric stability Class F. Based on a 1-meter diameter hole, an unignited release would result in an estimated pool radius of 421 feet. The unignited vapor cloud would extend to 10,237 feet to the LFL and 13,618 feet to one-half the LFL. It is important to identify certain key assumptions of conditions that must exist in order to achieve these vapor cloud distances. First it would be necessary for an event to create a 1-meter diameter hole by penetrating the outer hull, the inner hull, and cargo containment without ignition. Far more credible is that the event creating a 1-meter diameter hole would also result in a number of ignition sources which would lead to an LNG pool fire and subsequent thermal radiation hazards. It is also unlikely that a flammable vapor cloud could achieve these distances over land surfaces without encountering an ignition source, and subsequently burning back to the source.

The results of these calculations are in agreement with the Zones of Concern used by the Coast Guard in assessing the waterway suitability and are in agreement with the Sandia report. These intentional breach scenarios provide guidance to the Coast Guard in developing the operating restrictions for LNG carrier movements in the waterway, as well as in establishing potential impact areas for emergency response and evacuation planning. By focusing on the “worst-case” scenario for LNG transportation, there is a tendency to dismiss the potential hazards for other fuels and products commonly transported on our waterways. Some of the previously identified studies that calculate long hazard distances for LNG cargo fires also estimate similarly long distances for gasoline, propane, and jet fuel cargo fires. Also, it should not be assumed that the hazard distances identified are the assured outcome of an LNG carrier accident or attack, given the conservatism in the models and the level of damage required to yield such large scale releases. Further, these “worst-case” intentional breach scenarios should not be misconstrued as defining an exclusionary zone. Rather the average most probable “worst-case” scenarios provide guidance in developing the operating restrictions for LNG carrier movements in the Columbia River navigation channel, as well as in establishing potential impact areas for emergency response and evacuation planning.

For the project, NorthernStar proposes to receive LNG carriers with capacities up to 200,000 m³. However, based on existing uncertainties for larger ships, the Coast Guard COTP Portland would require that NorthernStar must either complete a site-specific analysis for the largest sized LNG vessel or limit arrivals to vessels with a cargo capacity no greater than 148,000 m³ until additional analysis addressing vessels with higher cargo capacities is completed.

4.11.5.4 LNG Carrier Transit to the Bradwood Landing LNG Project

Imported LNG could be obtained from exporting terminals throughout the world and delivered by LNG carriers to the proposed project. Exporting countries include Algeria, Australia, Brunei, Indonesia, Malaysia, Nigeria, Oman, Qatar, Trinidad, and United Arab Emirates. In 2007, LNG imports to the United States included: 59 percent from Trinidad, 15 percent from Egypt, 12 percent from Nigeria, 10 percent from Algeria, 2 percent from Qatar, and 2 percent from Equatorial Guinea.

Carrier Routes

The Columbia River navigation channel extends from CRM -2 (within the Pacific Ocean) to CRM 106.5 at Vancouver, Washington. From the territorial sea, LNG carriers would enter the Columbia River navigation channel within U.S. territorial waters at CRM -2 and would transit about 38 miles up the Columbia River to the proposed Bradwood Landing LNG terminal. LNG carriers would normally enter the mouth of the Columbia River about 3 hours before high tide. Two tugs would be required to escort the LNG carriers upriver, at least one of which must be a tractor tug, which would be made up as soon as it is safe to do so. The primary tug would be tethered at the direction of the pilot. A third tug would be required to assist with turning and mooring. All three tugs, which would be provided by NorthernStar, would be at least 60 Ton Astern Bollard Pull or larger and equipped with Class 1 fire fighting equipment.

The channel between CRM -2 and CRM 3 is 2,640 feet wide and is presently authorized and maintained to a depth of 55 feet within the northerly 2,000 feet, while the remaining 640 feet is maintained to a depth of 48 feet. From CRM 3 to the proposed Bradwood Landing LNG terminal site at CRM 38, the channel is at least 600 feet wide and 40 to 43 feet in depth. The COE's Columbia River Channel Improvement Project, which includes deepening of the navigation channel to 43 feet, will be completed before the LNG terminal would go into operation.

There are a number of major ports along the lower Columbia River, including Astoria, St. Helens, and Portland on the Oregon side of the river and the ports of Longview, Kalama, and Vancouver on the Washington side. With the exception of Astoria, all of these ports are upstream from the project site at CRM 38. The only bridge in the lower river below Longview, Washington (CRM 66) is at Astoria (CRM 13.5). The Astoria-Megler Bridge has a vertical clearance of 205 feet and a horizontal clearance of 1,070 feet. There are two anchorages located on either side of the channel adjacent to Astoria, referred to as the Astoria North Anchorage and the Astoria South Anchorage. Anchorages are used for temporarily holding ships while they are waiting to proceed upstream or downstream. However, these anchorages would not be used for LNG carriers.

All ships are required to have a Columbia River Bar Pilot between the sea buoy and Astoria, and a Columbia River Pilot upstream of Astoria. The pilots, supervised by the Oregon Board of Pilot Commissioners, are responsible for scheduling, monitoring of weather conditions, and establishing working conditions. The pilots maintain bridge-to-bridge communication and coordinate vessel passing operations through a vessel information system allowing pilots to ascertain probable passing points with other ships in the river.

The LNG carriers would dock at a specially constructed ship berth and maneuvering basin east of the LNG terminal site. The berth would be over 1,000 feet from the main navigation channel, providing a safe distance from the main channel for passing vessels. All maneuvering and docking of the LNG carriers at the berth would be carried out under tug assistance and pilot supervision. Docking, LNG offloading, and undocking would take about 24 hours.

WST conducted a vessel maneuvering simulation study for the stretch of the Columbia River from Pillar Rock Reach to Driscoll Reach and for the ship berth and maneuvering area at the Bradwood Landing terminal (WST, 2005). The study included the transit of a 140,000 m³ as well as a future 200,000 m³ LNG carrier through the Columbia River navigation channel at its current depth and width. The study indicated that LNG carriers could safely maneuver the approach to the LNG terminal and ship berth with the assistance of three tugs.

In addition to the WST study, in April 2006, four Columbia River Pilots conducted simulator analyses of LNG carriers transiting the Columbia River navigation channel at the Pacific Maritime Institute in Seattle, Washington. They concluded that the LNG carriers handled similar to other large vessels. They were able to navigate the channel in all conditions normally encountered on the Columbia River and looked at many situations involving other vessels. The ships could be handled satisfactorily when meeting other vessel traffic in the straight legs but would require extra room on the turns, where meeting other traffic should be avoided. The pilots determined that restrictions on night transits would not be necessary, although an initial period of daytime only transits would be prudent until the pilots obtain experience with the LNG carriers.

Hazard Zones Associated with the Proposed Routes

LNG carriers would traverse primarily offshore waters with the exception of approximately 38 miles of the Columbia River navigation channel to the LNG terminal. The LNG carrier would transit the channel at a speed of 8 to 12 knots, resulting in areas within the Zones of Concern being exposed to a potential transient thermal hazard for up to 15 minutes (see figure 2.1.2-1).

Communities located within the Zones of Concern (see figure 2.1.2-1) along the Washington side of the waterway include portions of Pillar Rock, Rockland, and Bayview that are overlapped by Zone 1; Altoona, Brookfield, and Skamokawa in Zone 2; and portions of Pigeon Bluff and Cathlamet in Zone 3. The western one-third of Puget Island is within the Zones of Concern, with about 22 structures overlapped by Zone 1, about 52 structures within Zone 2, and additional homes and farm areas in Zone 3. On the Oregon side of the waterway, in Clatsop County, waterfront portions of the communities of Hammond, Warrenton, and Astoria are overlapped by Zone 1; other portions of Warrenton and Astoria are in Zone 2; and parts of Warrenton, Astoria, and Clifton are in Zone 3. The potential impacts that LNG marine traffic along the waterway may have on existing residences, populations, housing, property values, and public services and infrastructure at these communities are discussed further in sections 4.7.1.2, 4.7.2.3, and 4.8.1.

In addition, a temporary hazard would exist around the slip during part of the 12- to 14-hour period while the LNG carrier is at the dock and unloading cargo. A fire associated with a potential spill resulting from a nominal cargo tank hole of an intentional event could expose the LNG storage tanks at the LNG terminal to a thermal radiation level of 10,000 Btu/ft²-hr for up to 20 minutes. Depending on the duration of the incident, damage to the LNG storage tanks at the terminal could compound the event. However, this compounded event would not create exclusion zones larger than the zones calculated for an LNG storage tank fire in section 4.11.4 and, therefore, would not create any additional risks for the public.

4.11.5.5 Requirements for LNG Carrier Operations in the Columbia River

The Coast Guard exercises regulatory authority over LNG facilities that affect the safety and security of port areas and navigable waterways under Executive Order 10173; the Magnuson Act (50 USC § 191); the Ports and Waterways Safety Act of 1972, as amended (33 USC § 1221, et seq.); and the Maritime Transportation Security Act of 2002 (46 USC § 701). The Coast Guard is responsible for

matters related to navigation safety, vessel engineering and safety standards, and all matters pertaining to the safety of facilities or equipment located in or adjacent to navigable waters up to the last valve immediately before the receiving tanks. The Coast Guard also has authority for LNG facility security plan review, approval and compliance verification as provided in Title 33 CFR Part 105, and siting as it pertains to the management of vessel traffic in and around the LNG facility.

The Coast Guard regulations in 33 CFR 127 apply to the marine transfer area of waterfront facilities between the LNG carrier and the last manifold or valve located immediately before a storage tank. Title 33 CFR 127 regulates the design, construction, equipment, operations, inspections, maintenance, testing, personnel training, firefighting, and security of LNG waterfront facilities. The safety systems, including communications, ESD, gas detection, and fire protection, must comply with the regulations in 33 CFR 127. Under 33 CFR 127.019, NorthernStar would be required to submit two copies of its Operations and Emergency Manuals to the COTP for examination.

Title 33 CFR 127 separates cargo transfer operations into three distinct phases: Preliminary Transfer Inspection (section 127.315); Declaration of Inspection (section 127.317); and LNG Transfer (section 127.319). These different sections require specific actions to be completed prior to and during the transfer. Additionally, there are specific actions required in the case of a release of LNG (section 127.321).

As required by its regulations (section 127.009), the Coast Guard is responsible for issuing an LOR as to the suitability of the waterway for LNG marine traffic with respect to the following items:

- information submitted under Section 127.007:
 - the physical location of the facility;
 - a description of the facility;
 - the LNG vessels' characteristics and the frequency of LNG shipments to or from the facility; and
 - charts showing waterway channels and identifying commercial, industrial, environmentally sensitive, and residential areas in and adjacent to the waterway used by the LNG vessels en route to the facility, within 25 kilometers (15.5 miles) of the facility.
- density and character of marine traffic;
- locks, bridges, or other manmade obstructions in the waterway; and
- the following factors adjacent to the facility:
 - depth of water;
 - tidal range;
 - protection from high seas;
 - natural hazards, including reefs, rocks, and sandbars;
 - underwater pipes and cables; and
 - distance of berthed vessels from the channel and the width of the channel.

The process of preparing the LOR begins when an applicant submits an LOI to the COTP. In accordance with 33 CFR 127.007, NorthernStar submitted an LOI to the Coast Guard on January 18, 2005 (see Appendix G). On September 9, 2005, the Coast Guard issued a notice in the Federal Register requesting comments pertaining specifically to the maritime safety and security aspects of the proposed LNG facility. In preparation for issuance of an LOR and the completion of certain other regulatory mandates, the comments received were incorporated into a formalized risk assessment process to assess the safety and security aspects of the facility, adjacent poor areas, and navigable waterways. The Coast Guard held a public meeting jointly with the FERC on September 29, 2005, pursuant to the notice. The Coast Guard's comment period ended on October 6, 2005.

The NVIC 05-05 provides Coast Guard COTPs/FMSCs, members of the LNG industry, and port stakeholders with guidance on assessing the suitability of a waterway for LNG marine traffic that takes into account conventional navigation safety/waterway management issues contemplated by the existing LOI/LOR process, but in addition, would also take completely into account MARSEC implications. In accordance with this guidance, each LNG project applicant is to submit a WSA to the cognizant COTP. The WSA process addresses the transportation of LNG from an LNG carrier's entrance into U.S. territorial waters, through its transit to and from the LNG receiving facility, including operations at the LNG carrier/facility interface. In addition, the WSA should address the navigational safety issues and port security issues introduced by the proposed LNG operations. The NVIC 05-05 also provides specific guidance on the timing and scope of the WSA.

NorthernStar's Waterway Suitability Assessment

NorthernStar submitted a preliminary WSA for the proposed project to the Coast Guard in December 2005. Based on feedback from the Coast Guard and other stakeholders, NorthernStar prepared a follow-on WSA, which was submitted to the Coast Guard in May 2006. The Coast Guard, with input from the Area Maritime Security Committee, local law enforcement, and emergency response organizations, has reviewed NorthernStar's WSA in accordance with the guidance in NVIC 05-05. The WSA review focused on the navigation safety and maritime security risks posed by LNG marine traffic, and the measures needed to responsibly manage these security risks.

Coast Guard Waterway Suitability Report

Based on the WSA review and consultations, the Coast Guard advised the FERC in its WSR dated February 28, 2007, that to make the Columbia River suitable for the LNG marine traffic associated with the Bradwood Landing Project, specific risk mitigation measures would be necessary. These measures are further detailed in the WSR (see Appendix G) and include, among others, the following operational conditions:

- a 500-yard moving safety/security zone around the LNG vessel during transit of the waterway where no other vessel may enter without first obtaining permission from the COTP;
- a 200-yard fixed security zone while the LNG vessel is moored at the LNG terminal;
- a 50-yard security zone around the LNG terminal when there is not a vessel at the dock;
- submission by NorthernStar of a Facility Security Plan for Coast Guard approval;

- a restriction on the size of LNG carriers transiting the Columbia River navigation channel to a capacity of 148,000 m³ until a completed site-specific risk analysis for larger ships is approved by the COTP;
- one-way LNG marine traffic along certain portions of the waterway such as at turns;
- submission to the COTP by NorthernStar of an annual update of its WSA to evaluate if any conditions in the waterway have changed that would require issuance of a new LOR;
- requirement that LNG vessels must board a Pilot(s) at least 5 miles before the CR Buoy, and for at least the first 6 months, at least two Pilots must be present throughout the transit;
- requirement that for the first 6 months, all transits must be during daylight hours;
- annual Coast Guard inspections of LNG vessels and facilities;
- escort of the vessel by at least two tugs along the waterway with a third to assist with turning and mooring where all three tugs will be at least 60 Ton Astern Bollard Pull or larger and equipped with Class 1 firefighting capability;
- simulator training for pilots and tug operators who have responsibility for LNG traffic; and
- implementation of a Coast Guard-approved *LNG Vessel Transit Management Plan*.

In addition, the WSR recommends additional facilities and infrastructure to make the waterway suitable for LNG marine traffic. The Coast Guard consulted with a variety of stakeholders, including state and local emergency responders, Marine Pilots, towing industry representatives, members of the Port Waterway Safety Committee, and the Area Maritime Security Committee to preliminarily identify the additional resources, public and/or private, that would be needed to implement prevention and mitigation strategies necessary for LNG operations. These measures include:

- upgrades to navigational aids including installation of three aids at Bradwood, a PORTS station at Bradwood contracted with NOAA to provide real time river level, current, and WX data, and a Doppler docking station;
- installation of a real time system for data collection on the Columbia River Bar conditions including an immersion study of deep-draft LNG vessels;
- augmentation of shoreside firefighting capabilities to provide protection services to the facility as well as communities along the transit route;
- implementation of a public notification system to notify the public along the transit route;
- increased gas detection capability, maintenance, and training to initial responders;
- implementation of a Regional Communication Plan and associated equipment to ensure that the facility, associated command centers, emergency responders, Coast Guard, tug operators, escort vessels, and pilots are able to communicate effectively;

- improvements to the Columbia River's Vessel Traffic Information System, including augmentation of a camera monitoring system capable of monitoring the entire route and detecting vessel traffic in wind, rain, fog, and dark conditions, installation of an AIS repeater located in Astoria; and
- availability of Coast Guard as well as other safety and security resources, including additional safety measures when a cruise ship is in port, security boardings, waterway monitoring, shoreline patrols, and vessel escorts to implement the additional security measures.

In addition to the above measures, additional specific measures, and, where applicable, the resources needed to implement them, are described in a separate supplementary report from the Coast Guard to the FERC on February 28, 2007. This supplementary report, and the specific details of these measures, have been designated Sensitive Security Information as defined in 49 CFR 1520. Because any unauthorized disclosure of details of these measures could be employed to circumvent the proposed security measures, it is not releasable to the public. These additional measures may include security boardings, surveillance and monitoring, patrols, vessel escorts, and additional security measures. Additionally, any security plan is a dynamic document that is subject to change with advances in technologies and improvements in intelligence gathering.

As the Coast Guard has determined that additional measures beyond those proposed by NorthernStar in the WSA would be required to responsibly manage the maritime safety and security risks associated with the LNG marine traffic, **we recommend that:**

- **Throughout the life of the facility, NorthernStar should ensure that the facility and any LNG vessel transiting to and from the facility comply with all requirements set forth by the Coast Guard Captain of the Port Sector Portland, including all risk mitigation measures recommended in the WSR.**

After completion of the final EIS, the Coast Guard will complete its review and issue an LOR to address the suitability of the waterway for LNG transport. If the Coast Guard issues an LOR finding the waterway suitable for LNG marine traffic with conditions, the necessary security measures would be further developed into the detailed *LNG Vessel Transit Management Plan*, which would become the basis for appropriate security measures for each MARSEC threat level. This plan would clearly spell out roles, responsibilities, and specific procedures for an LNG carrier transiting the Columbia River navigation channel up to the proposed Bradwood Landing LNG terminal, as well as for all agencies involved in implementing security and safety during the operation. Prior to the LNG carrier being granted permission to enter the shipping channels, both the vessel and facility would be required to be in full compliance with the Maritime Transportation Security Act and International Ship and Port Facility Security Code, and the security protocols to be established by the COTP in the *LNG Vessel Transit Management Plan*. The plan may include security measures such as: Coast Guard and other law enforcement agency vessels enforcing safety and security zones around the LNG carriers while in transit and moored at the terminal; shoreside surveillance and monitoring; and other prevention/mitigation strategies.

We recognize that the *LNG Vessel Transit Management Plan* would be a dynamic document that would be prepared well before import operations would commence, and that the port's overall security picture may change over that time period. New port activities may commence, infrastructure may be added, or population density may change. Improvements in technology to detect, deter, and defend against intentional acts may also develop. Therefore, **we recommend that:**

- **NorthernStar, until commencement of service, should annually review its WSA relating to LNG marine traffic for the project; update the assessment to reflect**

changing conditions which may impact the suitability of the waterway for LNG marine traffic; provide the updated assessment to the cognizant COTP/FMSC for review and validation and if appropriate, further action by the COTP/FMSC relating to LNG marine traffic; and provide a copy to the FERC staff.

In addition, NorthernStar would provide security for the terminal according to a Facility Security Plan that must be prepared under 33 CFR 105. This plan would need to be approved by the Coast Guard COTP. The requirements of this plan may include:

- a Facility Security Assessment to identify site vulnerabilities, possible security threats, consequences of an attack, and facility protective measures;
- procedures for responding to security incidents;
- a designated FSO responsible for implementing and periodically updating the Facility Security Plan and Assessment;
- scalable security measures to provide increasing levels of security at increasing MARSEC levels;
- security exercises at least once each calendar year and drills at least every 3 months; and
- mandatory reporting of all breaches of security and security incidents.
- Security at the facility would be provided by both active and passive systems. In accordance with federal regulations, the entire site would be surrounded by a protective enclosure (i.e., a fence) with sufficient strength to deter unauthorized access. The enclosure would also be illuminated with not less than 2.2 lux between sunset and sunrise. Intrusion detection systems and day/night camera coverage would identify unauthorized access. A separate security staff would conduct periodic patrols of the plant, and screen visitors and contractors. The security staff may also assist in maintaining security of the marine terminal during cargo unloading. NorthernStar would be required to submit their Facility Security Plan to the COTP for approval 60 days before commencement of operations.

Impact of Vessel Security Requirements

The potential impacts of the proposed LNG marine traffic for the Bradwood Landing Project on other commercial and recreational boaters can be addressed in relation to several general security requirements: 1) a moving safety/security zone for inbound LNG carriers; 2) a security zone around a moored LNG carrier; and 3) other measures as deemed appropriate.

If the Coast Guard issues an LOR finding the waterway suitable for LNG marine traffic with the conditions referenced in the WSR, the Coast Guard would promulgate a moving safety/security zone that would affect other vessels. Pursuant to such a regulation, no vessel would be allowed to enter the safety/security zone without first obtaining permission from the Coast Guard COTP. If the Coast Guard issues an LOR finding the waterway suitable for LNG marine traffic with conditions, it is anticipated that the LNG carriers would transit about 40 miles along the Columbia River navigation channel to the proposed LNG terminal. For the majority of this trip, an LNG carrier would travel at an average speed of 8 to 12 knots. Based on these assumed speeds and allowing time for pilot boarding and tug connecting, it

would take about 5.5 hours for LNG carriers to complete the trip to the LNG terminal. Additional time would be required to maneuver the LNG carrier into the berth.

If a moving safety/security zone during transit, a fixed security zone at the terminal, and one-way traffic in designated areas were implemented, they would affect other commercial and recreational traffic using the channel. The magnitude of the effect would also be influenced by other factors, such as the amount of time it takes to obtain a pilot and other competing ship traffic in the federal navigation channel.

If the proposed LNG terminal is constructed, and if the Coast Guard issues an LOR finding the waterway suitable for LNG marine traffic with the conditions described above under *Coast Guard Waterway Suitability Report*, as many as 125 LNG carriers for the Bradwood Landing LNG terminal could potentially move in and out of the Columbia River navigation channel every year. This is an increase in vessel traffic of about 25 percent for large, deep-draft vessels currently transiting these waterways but only a 7 percent increase overall. Other shipping activities would be moderately affected by this increase in traffic; however, based on the relatively modest current level of shipping activity, the impact is not expected to be substantial. The impacts of LNG marine traffic and associated security requirements on recreational and commercial vessel traffic are discussed in further detail in sections 4.7.1.4 and 4.8.1.7, respectively.

Anchors for the three navigational aides that would be placed to mark the northern edge of the maneuvering basin at the Bradwood Landing LNG terminal would have a localized short-term impact on the riverbed. The light from these navigational aides would be designed so as to have minimal impact on marine life.

Tugboats would have associated air emissions (see section 4.10.1.1); however, because the waterway is an attainment area and the tugs are a transient, mobile source, no significant air quality impacts are anticipated. Nor would the noise associated with the tugboats be likely to unduly disturb wildlife or the human population given their current presence along the waterway. Furthermore, the tugs would enhance safety, security, and fire-fighting capabilities.

The WSR would require a number of upgraded or new safety and security systems and procedures. The FERC has received comments on this and other LNG terminal proposals expressing concern about the cost of applying additional security measures and the potential burden on local taxpayers. Additional funding for state and local resources would be provided by NorthernStar to the extent called for by the Cost-Sharing Plan to be developed with the pertinent state and local agencies, discussed in section 4.11.6 *Emergency Response and Evacuation Planning*.

4.11.6 Emergency Response and Evacuation Planning

Prior to commencing service, NorthernStar would be required to prepare emergency procedure manuals in accordance with 49 CFR 193.2509 that provide for: a) responding to controllable emergencies and recognizing an uncontrollable emergency; b) taking action to minimize harm to the public including the possible need to evacuate the public; and c) coordination and cooperation with appropriate local officials. Specifically, section 193.2509(b)(3) requires, “Coordinating with appropriate local officials in preparation of an emergency evacuation plan...”

While the exclusion zones evaluated for the onshore facility in section 4.11.4 and the consequence areas for marine spills in section 4.11.5.3 provide guidance on the maximum extent of potential hazards, they should not be assumed to represent the evacuation zone for every potential incident. As with any other fuel or hazardous material, the actual severity of the incident would determine what area needs to be evacuated, if any, rather than a worst-case maximum zone. It is

anticipated that the emergency evacuation plans would identify evacuation distances based upon increasing severity of events.

On several LNG import terminal proposals, a number of organizations and individuals (including the ODE and Clatsop County on the Bradwood Landing Project) commented on the need to consider emergency response procedures. Section 3A(e) of the NGA, added by section 311 of the EPAct of 2005, stipulates that in any order authorizing an LNG terminal, the Commission shall require the LNG terminal operator to develop an ERP in consultation with the Coast Guard and state and local agencies. The FERC must approve the ERP prior to any final approval to begin construction.

In July 2006, NorthernStar began developing an ERP and was provided a copy of the FERC staff's prepared guidance for developing ERPs titled "Draft Guidance for LNG Terminal Operator's Emergency Response Plan" (Draft Guidance). In 2007, NorthernStar provided Clatsop County a draft ERP to review. PBS&J, an engineering consulting company, was contracted by Clatsop County to perform a review of NorthernStar's draft ERP. PBS&J's completed review, issued in July 2007, included a list of gaps between the FERC's Draft Guidance and NorthernStar's draft ERP. PBS&J provided a list of recommendations to NorthernStar detailing how the draft ERP could be improved. After PBS&J's review, NorthernStar revised its draft ERP and supplied it to Clatsop County for additional review. In November 2007, PBS&J published a second report detailing how most of their recommendations had been incorporated into NorthernStar's draft ERP. However, several recommendations were still outstanding.

On March 24, 2008, NorthernStar filed the draft ERP with the FERC for review. The draft ERP consists of incident specific plans and an Emergency Management Plan (EMP). The EMP consists of two parts: the EMP base plan, which has nine sections detailing the general purpose, philosophy, organization, responsibility, systems and layout, and the concept of operation for the LNG terminal; and the supporting annexes which cover warnings and notifications, communications, public affairs, evacuation, emergency vessel departure, emergency training, and material safety sheets.

From our initial review of the draft ERP and associated EMP, additional effort would be required to fully meet the requirements of recommendation number 62 in the draft EIS. Key items include the development of a comprehensive Cost-Sharing Plan to cover the costs of state and local resources responsible for security and safety; and documentation of consultation and coordination with the appropriate state and local agencies and Coast Guard in developing the plan. Further, it would be prudent to condense the more than 300 pages in the ERP and EMP documents into a single, user-friendly plan that would provide clear, concise guidance for the various responsible agencies. An outstanding recommendation in the PBS&J report also addressed this issue and should be incorporated into a final plan. As a result, **we continue to recommend that:**

- **NorthernStar should develop an ERP (including evacuation) and coordinate procedures with the Coast Guard, state, county, and local emergency planning groups; fire departments; state and local law enforcement; and appropriate federal agencies. This plan should include at a minimum:**
 - a. **designated contacts with state and local emergency response agencies;**
 - b. **scalable procedures for the prompt notification of appropriate local officials and emergency response agencies based on the level and severity of potential incidents;**

- c. **procedures for notifying residents and recreational users within areas of potential hazard;**
- d. **evacuation routes/methods for residents and other public use areas that are within any transient hazard areas along the route of the LNG vessel transit;**
- e. **locations of permanent sirens and other warning devices; and**
- f. **an “emergency coordinator” on each LNG vessel to activate sirens and other warning devices.**

The ERP should be filed with the Secretary for review and written approval by the Director of OEP prior to initial site preparation. NorthernStar should notify the FERC staff of all planning meetings in advance and should report progress on the development of its ERP at 3-month intervals.

As required by the EPCRA of 2005, FERC must review and approve each ERP prior to initial site preparation. Accordingly, FERC staff ensures that appropriate state and local agencies have been involved in preparing the plan and that the Coast Guard has been consulted and concurs. The ERP typically addresses the structure of the incident management organization of the LNG terminal, procedures for responding to emergencies within the LNG Terminal, and procedures for emergency evacuation adjacent to the LNG Terminal and along LNG vessel transit route. The ERP also includes plans for initial and continuing training of plant operators and local responders along with provisions for annual emergency response drills by terminal emergency personnel, first responders, emergency response agencies, and appropriate federal, state and local officials. We also review documentation that the required consultation with the Coast Guard and state and local agencies has been completed through correspondence with consulting agencies, and minutes or notes of coordination meetings.

The FERC has also received comments, including comments from the ODE, Oregon Department of Justice, and Clatsop County, expressing concern that the local community would have to bear some of the cost of ensuring the security and emergency management of the LNG facility and the LNG vessels while in transit and unloading at the berth. Section 3A(e) specifies that the ERP shall include a Cost-Sharing Plan that contains a description of any direct cost reimbursements NorthernStar agrees to provide to any state and local agencies with responsibility for security and safety at the LNG terminal and near vessels that serve the facility. Therefore, **we recommend that:**

- **The ERP should include a Cost-Sharing Plan identifying the mechanisms for funding all project-specific security/emergency management costs that would be imposed on state and local agencies. In addition to the funding of direct transit-related security/emergency management costs, this comprehensive plan should include funding mechanisms for the capital costs associated with any necessary security/emergency management equipment and personnel base. The Cost-Sharing Plan should be filed with the Secretary for review and written approval by the Director of OEP prior to initial site preparation.**

The cost-sharing plan must specify what the LNG terminal operator would provide to cover the cost of the state and local resources required to manage the security of the LNG terminal and LNG vessel, and the state and local resources required for safety and emergency management, including:

- Direct reimbursement for any per-transit security and/or emergency management costs (for example overtime for police or fire department personnel);

- Capital costs associated with security/emergency management equipment and personnel base (for example patrol boats, fire fighting equipment); and
- Annual costs for providing specialized training for local fire departments, mutual aid departments, and emergency response personnel; and for conducting exercises.

The cost sharing plan must include the LNG terminal operator's letter of commitment with agency acknowledgement for each state and local agency designated to receive resources.

4.11.7 Conclusions on Marine Traffic Safety

The operational safety of LNG carriers is under the jurisdiction of the Coast Guard. If the Coast Guard issues an LOR determining suitability of the waterway for LNG marine traffic with conditions, operational restrictions that may be imposed by the Coast Guard would minimize the potential for a hazardous event occurring in the Columbia River and affecting the safety of the nearby public.

Since 1959, LNG has been transported by ship without a major release of cargo or a major accident involving an LNG carrier. Over the last 45 years, LNG carriers have made over 44,000 voyages worldwide. Based on the extensive operational experience of LNG shipping and the structural design of an LNG carrier, the likelihood of a cargo containment failure and subsequent LNG spill from a vessel casualty - collision, grounding, or allision - is highly unlikely. For intentional spills, the impacts to public safety and property could exist within the Zones of Concern. The severity of impacts within the zones would depend on the location of the incident relative to a specific area, the scope of the incident, and whether the released LNG is ignited or dispersed. However, if the Coast Guard issues a LOR finding the waterway suitable for LNG marine traffic with the conditions referenced under *Coast Guard Waterway Suitability Report*, the Coast Guard would control the transit of the LNG vessel through the harbor and while unloading cargo. The security provisions and operational controls that would be imposed by the Coast Guard, and the local pilots, to direct movement of LNG carriers would maintain the risk of a marine LNG spill, either with or without ignition, at acceptable levels. Therefore, the NorthernStar LNG Project would be unlikely to result in a significant impact within the Zones of Concern because it is unlikely that a substantial cargo release would occur.

4.11.8 Terrorism and Security Issues

The security requirements for the onshore component of the proposed project are governed by 49 CFR 193, Subpart J - Security. This subpart includes requirements for conducting security inspections and patrols, liaison with local law enforcement officials, design and construction of protective enclosures, lighting, monitoring, alternative power sources, and warning signs. Requirements for maintaining safety of the marine terminal are in the Coast Guard's regulations in 33 CFR 127. Requirements for maintaining security of the marine terminal are in 33 CFR 105.

In the aftermath of the terrorist attacks that occurred on September 11, 2001, terrorism has become a very real concern for the facilities under the Commission's jurisdiction. The FERC, like other federal agencies, is faced with a dilemma in how much information can be offered to the public while still providing a significant level of protection to the facility. Consequently, the FERC has removed energy facility design plans and location information from its website to ensure that sensitive information filed under CEII is not readily available (RM02-4-000 and PL02-1-000 issued February 20, 2003).

Since September 11, 2001, the FERC has been involved with other federal agencies in developing a coordinated approach to protecting the energy facilities of the United States. The FERC continues to coordinate with these agencies, specifically with the Coast Guard, to address this issue. The Coast Guard

now requires arriving ships to provide it with a 96-hour advance notice of arrival that includes key information about the vessel and its crew, which allows the Coast Guard to conduct a terrorism risk assessment and put in place appropriate mitigation before the ship reaches the navigation channel. In addition, interstate natural gas companies are actively involved with several industry groups to chart how best to address security measures in the current environment. A Security Task Force has been created and is addressing ways to improve pipeline security practices, strengthen communications within the industry and the interface with government, and extend public outreach efforts.

On October 22, 2003, the Coast Guard issued a series of six final rules, which promulgated the maritime security requirements of the Marine Transportation Security Act of 2002: Implementation of National Maritime Security Initiatives; Area Maritime Security; Vessel Security; Facility Security; Outer Continental Shelf Facility Security; and the Automatic Identification System. The entire series of rulemakings establishes a new subchapter H in 33 CFR. In support of the rulemakings, the Coast Guard applied a risk-based decision-making process to comprehensively evaluate the relative risks of various target and attack mode combinations and scenarios for those vessel types and port facilities that pose a risk of a security incident. This approach provides a more realistic estimation of risk than a simple worst-case outcome assessment. Risk management principles acknowledge that while risk generally cannot be eliminated, it can be reduced by adjusting operations to lower consequences, threats, or vulnerability - recognizing that it is easier to reduce vulnerabilities by adding security measures.

On December 29, 2003, all terminal owners or operators subject to 33 CFR 105 were required to submit a Facility Security Assessment and Facility Security Plan to the Coast Guard COTP for review and approval. The Facility Security Plans were required to be implemented no later than July 1, 2004, or for facilities constructed after July 1, 2004, 60 days prior to operations. Some of the principal owner or operator responsibilities include:

- designating a FSO with a general knowledge of current security threats and patterns, risk assessment methodology, and the responsibility for implementing the Facility Security Plan and Assessment and performing an annual audit for the life of the project;
- conducting a Facility Security Assessment to identify site vulnerabilities, possible security threats and consequences of an attack, and facility protective measures;
- developing a Facility Security Plan based on the Facility Security Assessment, with procedures for responding to transportation security incidents; notification and coordination with local, state, and federal authorities; prevention of unauthorized access; measures and equipment to prevent or deter dangerous substances and devices; training; and evacuation;
- implementing scalable security measures to provide increasing levels of security at increasing MARSEC levels for facility access control, restricted areas, cargo handling, vessel stores and bunkers, and monitoring;
- conducting security exercises at least once each calendar year and drills at least every 3 months; and
- reporting of all breaches of security and security incidents.

Increased security awareness has occurred throughout the industry and the nation. President Bush established the Department of Homeland Security with the mission of coordinating the efforts of all executive departments and agencies to detect, prepare for, prevent, protect against, respond to, and

recover from terrorist attacks within the United States. The Commission, in cooperation with other federal agencies and industry trade groups, has joined in the efforts to protect the energy infrastructure, including the more than 300,000 miles of interstate natural gas transmission pipeline and associated LNG facilities.

Safety and security are important considerations in any Commission action. The attacks of September 11, 2001 have changed the way pipeline operators as well as regulators must consider terrorism, both in approving new projects and in operating existing facilities. However, the likelihood of future acts of terrorism or sabotage occurring at the proposed terminal expansion, or at any of the myriad of natural gas pipeline or energy facilities throughout the United States is unpredictable given the disparate motives and abilities of terrorist groups. It is possible that a release from the LNG storage tanks could be caused by an intentional act, such as a terrorist attack. Although an intentional breach scenario could result in greater thermal radiation in the immediate vicinity of the release, such scenarios are typically associated with the desire to inflict damage to major infrastructure and population and commercial centers. However, existing and proposed security measures discussed in this section make significant impacts to human life and property from a terrorist attack unlikely. The continuing need to construct facilities to support the future natural gas pipeline infrastructure is not diminished from the threat of any such unpredictable acts.

4.11.9 Pipeline Facilities

The transportation of natural gas by pipeline involves some risk to the public in the event of an accident and subsequent release of gas. The greatest hazard is a fire or explosion following a major pipeline rupture.

Methane, the primary component of natural gas, is colorless, odorless, and tasteless. It is not toxic, but is classified as a simple asphyxiate, possessing a slight inhalation hazard. If breathed in high concentration, oxygen deficiency can result in serious injury or death.

Methane has an ignition temperature of 1,000°F and is flammable at concentrations between 5.0 and 15.0 percent in air. Unconfined mixtures of methane in air are not explosive. However, a flammable concentration within an enclosed space in the presence of an ignition source can explode. Methane is buoyant at atmospheric temperatures and disperses rapidly in air.

4.11.9.1 Safety Standards

The DOT is mandated to provide pipeline safety under 49 USC § 601. The PHMSA Office of Pipeline Safety (OPS) administers the national regulatory program to ensure the safe transportation of natural gas and other hazardous materials by pipeline. It develops safety regulations and other approaches to risk management that ensure safety in the design, construction, testing, operation, maintenance, and emergency response of pipeline facilities. Many of the regulations are written as performance standards which set the level of safety to be attained and allow the pipeline operator to use various technologies to achieve safety. The PHMSA ensures that people and the environment are protected from the risk of pipeline incidents. This work is shared with state agency partners and others at the federal, state, and local level. Section 5(a) of the Natural Gas Pipeline Safety Act provides for a state agency to assume all aspects of the safety program for intrastate facilities by adopting and enforcing the federal standards, while section 5(b) permits a state agency that does not qualify under section 5(a) to perform certain inspection and monitoring functions. A state may also act as the DOT's agent to inspect interstate facilities within its boundaries; however, the DOT is responsible for enforcement action. The majority of the states have either 5(a) certifications or 5(b) agreements, while nine states act as interstate agents.

The DOT pipeline standards are published in 49 CFR Parts 190-199. Part 192 of 49 CFR specifically addresses natural gas pipeline safety issues.

Under a Memorandum of Understanding on Natural Gas Transportation Facilities (Memorandum) dated January 15, 1993, between the DOT and the FERC, the DOT has the exclusive authority to promulgate federal safety standards used in the transportation of natural gas. Section 157.14(a)(9)(vi) of the FERC's regulations require that an applicant certify that it will design, install, inspect, test, construct, operate, replace, and maintain the facility for which a certificate is requested in accordance with federal safety standards and plans for maintenance and inspection, or shall certify that it has been granted a waiver of the requirements of the safety standards by the DOT in accordance with section 3(e) of the Natural Gas Pipeline Safety Act. The FERC accepts this certification and does not impose additional safety standards other than the DOT standards. If the Commission becomes aware of an existing or potential safety problem, there is a provision in the Memorandum to promptly alert the DOT. The Memorandum also provides for referring complaints and inquiries made by state and local governments and the general public involving safety matters related to pipeline under the Commission's jurisdiction.

The FERC also participates as a member of the DOT's Technical Pipeline Safety Standards Committee which determines if proposed safety regulations are reasonable, feasible, and practicable.

The pipeline and aboveground facilities associated with the Bradwood Landing Project must be designed, constructed, operated, and maintained in accordance with the DOT Minimum Federal Safety Standards in 49 CFR Part 192. The regulations are intended to ensure adequate protection for the public and to prevent natural gas facility accidents and failures. Part 192 specifies material selection and qualification, minimum design requirements, and protection from internal, external, and atmospheric corrosion.

Part 192 also defines area classifications, based on population density in the vicinity of the pipeline, and specifies more rigorous safety requirements for populated areas. The class location unit is an area that extends 220 yards on either side of the centerline of any continuous 1-mile length of pipeline. The four area classifications are defined as follows:

- Class 1 – Location with 10 or fewer buildings intended for human occupancy.
- Class 2 – Location with more than 10 but less than 46 buildings intended for human occupancy.
- Class 3 – Location with 46 or more buildings intended for human occupancy or where the pipeline lies within 100 yards of any building, or small well-defined outside area occupied by 20 or more people on at least 5 days per week for 10 weeks in any 12-month period.
- Class 4 – Location where buildings with four or more stories aboveground are prevalent.

Class locations representing more populated areas require higher safety factors in pipeline design, testing, and operation. Pipelines constructed on land in Class 1 locations must be installed with a minimum depth of cover of 30 inches in normal soil and 18 inches in consolidated rock. Class 2, 3, and 4 locations, as well as drainage ditches of public roads and railroad crossings, require a minimum cover of 36 inches in normal soil and 24 inches in consolidated rock.

Class locations also specify the maximum distance to a sectionalizing block valve (e.g., 10.0 miles in Class 1, 7.5 miles in Class 2, 4.0 miles in Class 3, and 2.5 miles in Class 4). Pipe wall thickness

and pipeline design pressures, hydrostatic test pressures, maximum allowable operating pressure, inspection and testing of welds, and frequency of pipeline patrols and leak surveys must also conform to higher standards in more populated areas. Approximately 2.9 miles of the proposed pipeline would be within Class 3 locations, 10.9 miles would be within Class 2 locations, and the remaining 22.4 would be within Class 1 locations.

DOT regulations at 49 CFR 192.179, entitled Transmission Line Valves, require that each point of any Class 3 pipeline be within 4 miles from a mainline valve unless the DOT Administrator finds that an alternate spacing would offer an equivalent measure of safety. NorthernStar has identified a Class 3 pipeline segment between MPs 13.17 and 13.43 with the nearest mainline valve at MP 18.8. Therefore, **we recommend that:**

- **Prior to construction, NorthernStar should either submit a determination from the DOT documenting agreement with the proposed pipeline valve locations, or submit for the review and written approval by the Director of OEP modified pipeline design plans demonstrating compliance with 49 CFR 192.179.**

If a subsequent increase in population density adjacent to the right-of-way indicates a change in class location for the pipeline, NorthernStar would be required to reduce the maximum allowable operating pressure or replace the segment with pipe of sufficient grade and wall thickness, if applicable, to comply with the DOT code of regulations for the new class location.

In 2002, Congress passed an act to strengthen the Nation's pipeline safety laws. The Pipeline Safety Improvement Act of 2002 (HR 3609) was passed by Congress on November 15, 2002, and signed into law by the President in December 2002. As of December 17, 2004, gas transmission operators must develop and follow a written integrity management program that contains all the elements described in §192.911 and addresses the risks on each covered transmission pipeline segment. Specifically, the law establishes an integrity management program which applies to all high consequence areas (HCAs). The DOT (68 Federal Register 69778, 69 Federal Register 18228, and 69 Federal Register 29903) defines HCAs as they relate to the different class zones, potential impact circles, or areas containing an identified site as defined in §192.903 of the DOT regulations.

The OPS published a series of rules from August 6, 2002 to May 26, 2004 (69 Federal Register 29903), that defines HCAs where a gas pipeline accident could do considerable harm to people and their property and requires an integrity management program to minimize the potential for an accident. This definition satisfies, in part, the Congressional mandate in 49 USC 60109 for the OPS to prescribe standards that establish criteria for identifying each gas pipeline facility in a high-density population area.

The HCAs may be defined in one of two ways. In the first method an HCA includes:

- current Class 3 and 4 locations,
- any area in Class 1 or 2 where the potential impact radius²⁸ is greater than 660 feet and there are 20 or more buildings intended for human occupancy within the potential impact circle,²⁹ or

²⁸ The potential impact radius is calculated as the product of 0.69 and the square root of the MAOP of the pipeline in psi multiplied by the pipeline diameter in inches.

²⁹ The potential impact circle is a circle of radius equal to the potential impact radius.

- any area in Class 1 or 2 where the potential impact circle includes an identified site.³⁰

In the second method an HCA includes any area within a potential impact circle which contains:

- 20 or more buildings intended for human occupancy, or
- an identified site.

Once a pipeline operator has determined the HCAs on its pipeline, it must apply the elements of its integrity management program to those segments of the pipeline within HCAs. The DOT regulations specify the requirements for the integrity management plan at § 192.911. NorthernStar has identified 13 HCAs that are crossed by and adjacent to the proposed pipeline route (see table 4.11.9-1).

TABLE 4.11.9-1					
High Consequence Areas Crossed by and Adjacent to the Bradwood Landing Pipeline ^a					
Beginning MP	Ending MP	Criteria	Distance To Pipeline	Land Use	Comments
0.00	0.15	Class 3	< 660 feet	Future LNG Terminal Site	
3.25	4.10	Class 3	< 660 feet	Wauna Industrial Site	
7.94	8.86	Identified Site	850 feet	Jones Beach ATV Sand Dunes	Potential for 20+ ATVs
13.17	13.43	Class 3	300 feet	Boat Launch/Storage	Potential for 20+ boaters
13.08	13.48	Identified Site	700 feet	Boat Storage/Launch, Fish Processing	Potential for 20+ boaters
18.00	18.91	Class 3	< 660 feet	Port Westward Industrial Site	End 36-inch pipeline
18.91	19.05	Class 3	< 660 feet	Port Westward Industrial Site	Begin 30-inch pipeline
34.00	34.38	Class 3	50-1000 feet	Cowlitz River Beach	Public Access Beach 20+ boaters
34.38	34.63	Class 3	200 feet	Scales/Truck shop	Potential for 5 to 20 workers
34.88	35.09	Identified Site	740 feet	Restaurant/Outside Bar	Potential for 20 or more people
35.09	35.40	Identified Site	550 feet	Interstate Highway 5 truck scale	Potential for 20 or more people
35.40	35.80	Identified Site	500 feet	Church	Potential for 20 or more people
^a For 36-inch-diameter pipeline with a Maximum Allowable Operating Pressure (MAOP) of 1,280 pounds per square inch (psi), the radius for the potential impact circle is 889 feet; for 30-inch-diameter pipeline with a MAOP of 1280 psi, the radius for the potential impact circle is 741 feet.					

The pipeline integrity management rule for HCAs requires inspection of the entire pipeline in HCAs every 7 years.

Part 192 prescribes the minimum standards for operating and maintaining pipeline facilities, including the requirement to establish a written plan governing these activities. Under section 192.615, each pipeline operator must also establish an emergency plan that includes procedures to minimize the hazards in a natural gas pipeline emergency. Key elements of the plan include procedures for:

- receiving, identifying, and classifying emergency events, gas leakage, fires, explosions, and natural disasters;

³⁰ An identified site is an outside area or open structure that is occupied by 20 or more persons on at least 50 days in any 12-month period; a building that is occupied by 20 or more persons on at least 5 days per week for any 10 weeks in any 12-month period; or a facility that is occupied by persons who are confined, are of impaired mobility, or would be difficult to evacuate.

- establishing and maintaining communications with local fire, police, and public officials, and coordinating emergency response;
- emergency shutdown of system and safe restoration of service;
- making personnel, equipment, tools, and materials available at the scene of an emergency; and
- protecting people first and then property, and making them safe from actual or potential hazards.

Part 192 requires that each operator must establish and maintain liaison with appropriate fire, police, and public officials to learn the resources and responsibilities of each organization that may respond to a natural gas pipeline emergency, and to coordinate mutual assistance. The operator must also establish a continuing education program to enable customers, the public, government officials, and those engaged in excavation activities to recognize a gas pipeline emergency and report it to appropriate public officials. NorthernStar would provide the appropriate training to local emergency service personnel before the pipeline is placed in service. No additional specialized local fire protection equipment would be required to handle pipeline emergencies.

4.11.9.2 Pipeline Accident Data

Since February 9, 1970, 49 CFR Part 191 has required all operators of transmission and gathering systems to notify the DOT of any reportable incident and to submit a report on form F7100.2 within 20 days. Reportable incidents are defined as any leaks that:

- caused a death or personal injury requiring hospitalization;
- required taking any segment of transmission line out of service;
- resulted in gas ignition;
- caused estimated damage to the property of the operator, or others, or both, of a total of \$5,000 or more;
- required immediate repair on a transmission line;
- occurred while testing with gas or another medium; or
- in the judgment of the operator was significant, even though it did not meet the above criteria.

The DOT changed reporting requirements after June 1984 to reduce the amount of data collected. Since that date, operators must only report incidents that involve property damage of more than \$50,000, injury, death, release of gas, or that are otherwise considered significant by the operator. Table 4.11.9-2 presents a summary of incident data for the 1970 to 1984 period, as well as more recent incident data for 1986 through 2005, recognizing the difference in reporting requirements. The 14.5-year period from

1970 through June 1984, which provides a larger universe of data and more basic report information than subsequent years, has been subject to detailed analysis, as discussed in the following sections.³¹

TABLE 4.11.9-2		
Natural Gas Service Incidents by Cause		
Cause	Incidents per 1,000 miles of Pipeline (percentage)	
	1970-1984	1986-2005
Outside force	0.70 (53.8)	0.10 (38.5)
Corrosion	0.22 (16.9)	0.06 (23.1)
Construction or material defect	0.27 (20.8)	0.04 (15.4)
Other	0.11 (8.5)	0.06 (23.1)
Total	1.30	0.26

During the 14.5-year period, 5,862 service incidents were reported over the more than 300,000 total miles of natural gas transmission and gathering systems nationwide. Service incidents, defined as failures that occur during pipeline operation, have remained fairly constant over this period with no clear upward or downward trend in annual totals. In addition, 2,013 test failures were reported. Correction of test failures removed defects from the pipeline before operation.

Additional insight into the nature of service incidents may be found by examining the primary factors that caused the failures. Table 4.11.9-2 provides a percentage distribution of the causal factors as well as the annual frequency of each factor per 1,000 miles of pipeline in service.

The dominant incident cause is outside forces, constituting 53.8 percent of all service incidents. Outside forces incidents result from the encroachment of mechanical equipment such as bulldozers and backhoes; earth movements due to soil settlement, washouts, or geologic hazards; weather effects such as winds, storms, and thermal strains; and willful damage.

Table 4.11.9-3 shows that human error in equipment usage was responsible for approximately 75 percent of outside forces incidents. Since April 1982, operators have been required to participate in "One Call" public utility programs in populated areas to minimize unauthorized excavation activities in the vicinity of pipelines. The "One Call" program is a service used by public utilities and some private sector companies (e.g., oil pipelines and cable television) to provide preconstruction information to contractors or other maintenance workers on the underground location of pipes, cables, and culverts. The 1986 through 2005 data show that the portion of incidents caused by outside forces has decreased to 38.5 percent.

TABLE 4.11.9-3	
Outside Forces Incidents by Cause (1970-1984)	
Cause	Percent
Equipment operated by outside party	67.1
Equipment operated by or for operator	7.3
Earth movement	13.3
Weather	10.8
Other	1.5

³¹ Jones, D.J., G.S. Kramer, D.N. Gideon, and R.J. Eiber, 1986. "An Analysis of Reportable Incidents for Natural Gas Transportation and Gathering Lines 1970 Through June 1984." NG-18 Report No. 158, Pipeline Research Committee of the American Gas Association.

The pipelines included in the data set in table 4.11.9-2 vary widely in terms of age, pipe diameter, and level of corrosion control. Each variable influences the incident frequency that may be expected for a specific segment of pipeline.

The frequency of service incidents is strongly dependent on pipeline age. While pipelines installed since 1950 exhibit a fairly constant level of service incident frequency, pipelines installed before that time have a significantly higher rate, partially due to corrosion. Older pipelines have a higher frequency of corrosion incidents (including stress corrosion cracking, the failure of ductile metals subjected to constant stress in a corrosive environment), since corrosion is a time-dependent process. Further, new pipe generally uses more advanced coatings and cathodic protection to reduce corrosion potential.

Older pipelines have a higher frequency of outside forces incidents partly because their location may be less well known and less well marked than newer lines. In addition, the older pipelines contain a disproportionate number of smaller diameter pipelines, which have a greater rate of outside forces incidents. Small diameter pipelines are more easily crushed or broken by mechanical equipment or earth movements.

Table 4.11.9-4 clearly demonstrates the effectiveness of corrosion control in reducing the incidence of failures caused by external corrosion. The use of both an external protective coating and a cathodic protection system, required on all pipelines installed after July 1971, significantly reduces the rate of failure compared to unprotected or partially protected pipe. The data shows that bare, cathodically protected pipe actually has a higher corrosion rate than unprotected pipe. This anomaly reflects the retrofitting of cathodic protection to actively corroding spots on pipes.

TABLE 4.11.9-4	
External Corrosion by Level of Control (1970-1984)	
Corrosion Control	Incidents per 1,000 miles per Year
None-bare pipe	0.42
Cathodic protection only	0.97
Coated only	0.40
Coated and cathodic protection	0.11

The WUTC notes that there have been four gas transmission rupture incidents in Washington caused by weather-related outside forces, two of which occurred near the proposed project area. On March 16, 1995, Williams Northwest experienced a rupture in the 26-inch pipeline near Castle Rock, Washington. The same line experienced a weather-related rupture on February 9, 1997 near Kalama, Washington. Both of these rupture incidents were linked to heavy rainfall, ground saturation, and increase in groundwater (WUTC, Undated). On November 9, 2006, record rains eroded the Toutle River bank near Castle Rock and exposed approximately 400 feet of Williams Northwest pipeline. Approximately 100 feet of river bank sediment was washed away; however, the exposed pipe did not rupture (Daily News, 2006b) and was subsequently restored by Williams.

The May 1, 2003 rupture of the Williams Northwest pipeline (constructed in 1956) near Lake Tapps, Washington (east of Tacoma) caused the release of natural gas for over an hour and evacuation of local residences, a school, and a business (DOT, 2003a). Subsequent investigation into the cause of the Lake Tapps release found that the rupture was caused by stress corrosion cracking (DOT, 2003b). The same pipeline experienced a release on December 13, 2003 near Toledo, Washington (approximately 20 miles north of Kelso) resulting in gas seepage for approximately 3 hours, no ignition, fatalities or injuries, and voluntary evacuation of four residences (Bellingham, 2003; DOT, 2003b). On December 19, 2003,

OPS and WUTC issued a corrective action order which required Williams to shut down Williams Northwest and either replace the 298-mile pipeline or prove that the line was resistant to stress corrosion cracking (DOT, 2003b; WUTC 2003). Williams filed an application with the FERC to replace the pipeline and was authorized to complete this activity on September 13, 2005 (FERC, 2005).

Investigation of an April 15, 2002 rupture of the Williams Northwest pipeline near Kalama found that the pipeline was laid directly on native material when constructed in 1956. The failure was caused by rock impingement on the pipeline (WUTC, 2002).

4.11.9.3 Impact on Public Safety

The service incident data summarized in table 4.11.9-2 include pipeline failures of all magnitudes with widely varying consequences. Approximately two-thirds of the incidents were classified as leaks, and the remaining third classified as ruptures, implying a more serious failure.

Table 4.11.9-5 presents the average annual fatalities that occurred on natural gas transmission and gathering lines from 1970 to 2005. Fatalities between 1970 and June 1984 have been separated into employees and nonemployees, to better identify a fatality rate experienced by the general public. Of the total 5.0 nationwide average, fatalities among the public averaged 2.6 per year over this period. The simplified reporting requirements in effect after June 1984 do not differentiate between employees and nonemployees. However, the data show that the total annual average for the period 1984 through 2005 decreased to 3.6 fatalities per year. Subtracting two major offshore incidents in 1989, which do not reflect the risk to the onshore public, yields a total annual rate of 2.8 fatalities per year for this period.

TABLE 4.11.9-5			
Annual Average Fatalities - Natural Gas Transmission and Gathering Systems ^{a, b}			
Year	Employees	Nonemployees	Total
1970-June 1984	2.4	2.6	5.0
1984-2005 ^c	-	-	3.6
1984-2005 ^c	-	-	2.8 ^d
^a 1970 through June 1984 - American Gas Association, 1986. ^b DOT Hazardous Materials Information System. ^c Employee/nonemployee breakdown not available after June 1984. ^d Without 18 offshore fatalities occurring in 1989 - 11 fatalities resulted from a fishing vessel striking an offshore pipeline and 7 fatalities resulted from explosion on an offshore production platform.			

The nationwide totals of accidental fatalities from various manmade and natural hazards are listed in table 4.11.9-6 in order to provide a relative measure of the industry-wide safety of natural gas pipelines. Direct comparisons between accident categories should be made cautiously, however, because individual exposures to hazards are not uniform among all categories. Nevertheless, the average of 2.6 public fatalities per year is relatively small considering the more than 300,000 miles of transmission and gathering lines in service nationwide. Furthermore, the fatality rate is approximately two orders of magnitude (100 times) lower than the fatalities from natural hazards such as lightning, tornados, floods, earthquakes, etc.

TABLE 4.11.9-6	
Nationwide Accidental Deaths ^a	
Type of Accident	Fatalities
All accidents	90,523
Motor vehicles	43,649
Falls	14,985
Drowning	3,488
Poisoning	9,510
Fires and burns	3,791
Suffocation by ingested object	3,206
Tornado, flood, earthquake, etc. (1984-93 average)	181
All liquid and gas pipelines (1978-87 average) ^b	27
Gas transmission and gathering lines nonemployees only (1970-84 average) ^c	2.6
^a All data, unless otherwise noted, reflects 1996 statistics from the U.S. Department of Commerce, Bureau of the Census, "Statistical Abstract of the U.S. 118th Edition."	
^b U.S. Department of Transportation, "Annual Report on Pipeline Safety - Calendar Year 1987."	
^c American Gas Association, 1986.	

The available data show that natural gas pipelines continue to be a safe, reliable means of energy transportation. Based on approximately 301,000 miles in service, the rate of public fatalities for the nationwide mix of transmission and gathering lines in service is 0.01 per year per 1,000 miles of pipeline. Using this rate, the Bradwood Landing Project might result in a public fatality every 2,762 years. This would represent a slight increase in risk to the nearby public.

4.12 CUMULATIVE IMPACTS

Cumulative impacts may result when the environmental effects associated with a proposed project are added to temporary (construction-related) or permanent (operations-related) impacts associated with past, present, or reasonably foreseeable future projects. Although the individual impact of each separate project might not be significant, the additive or synergistic effects of multiple projects could be significant. This cumulative analysis focuses on potential impacts from the proposed project on resource areas or issues where their incremental contribution would be potentially significant when added to the potential impacts of other actions.

An action must first meet three criteria to be a candidate for inclusion in the cumulative analysis. The action must:

- affect a resource (e.g., marine biological resources) or resources potentially affected by the proposed project;
- cause this impact within all, or part of, the project area; and
- cause this impact within all, or part of, the timespan for the potential impact from the proposed project.

Existing environmental conditions in the vicinity of the proposed Bradwood Landing Project reflect the extensive changes brought about by long-term human occupancy and use of the project area. For example, native vegetative communities in the project area have been substantially altered from their pre-Euro-American settlement condition by timber harvest, agricultural practices, introduction of non-native species, and commercial/industrial and residential developments, while fisheries have been affected by commercial harvest and physical alteration of rivers and streams used by anadromous species.

Table 4.12-1 lists present or reasonably foreseeable future projects or activities that may cumulatively or additively impact resources that would be affected by construction and operation of the Bradwood Landing Project. Currently, we are aware of one other potential LNG import terminal project along the lower Columbia River: the Oregon LNG project at Warrenton, Oregon. LNG import terminals at Port Westward and Tansy Point are not considered reasonably foreseeable projects because initiation of FERC's review process, which would require the applicants to provide information detailing the scope and magnitude of expected impacts, has not occurred. Therefore, the speculative projects at Port Westward and Tansy Point will not be included in this cumulative impacts analysis.

The FERC approved Oregon LNG's request to implement the Commission's Pre-filing Process on June 19, 2007 (FERC Docket No. PF07-10). The Oregon LNG Project consists of an LNG import terminal proposed to be located on 96 acres at the eastern Skipanon Peninsula along the Columbia River in Warrenton, Oregon. A 121-mile sendout natural gas pipeline would extend southeast and connect with the Williams Northwest Pipeline system in Clackamas County. The LNG terminal would receive up to about 100 LNG carriers annually, and 1.2 million cubic yards of material would be dredged for the turning basin and berth.

The FERC accepted the Palomar Project (PF07-13-000) for Pre-filing review on August 30, 2007. This project would consist of a 220-mile-long, 36-inch-diameter natural gas pipeline from the existing GTN pipeline near Madris, Oregon, potentially connecting with the Bradwood Landing Project.

TABLE 4.12-1

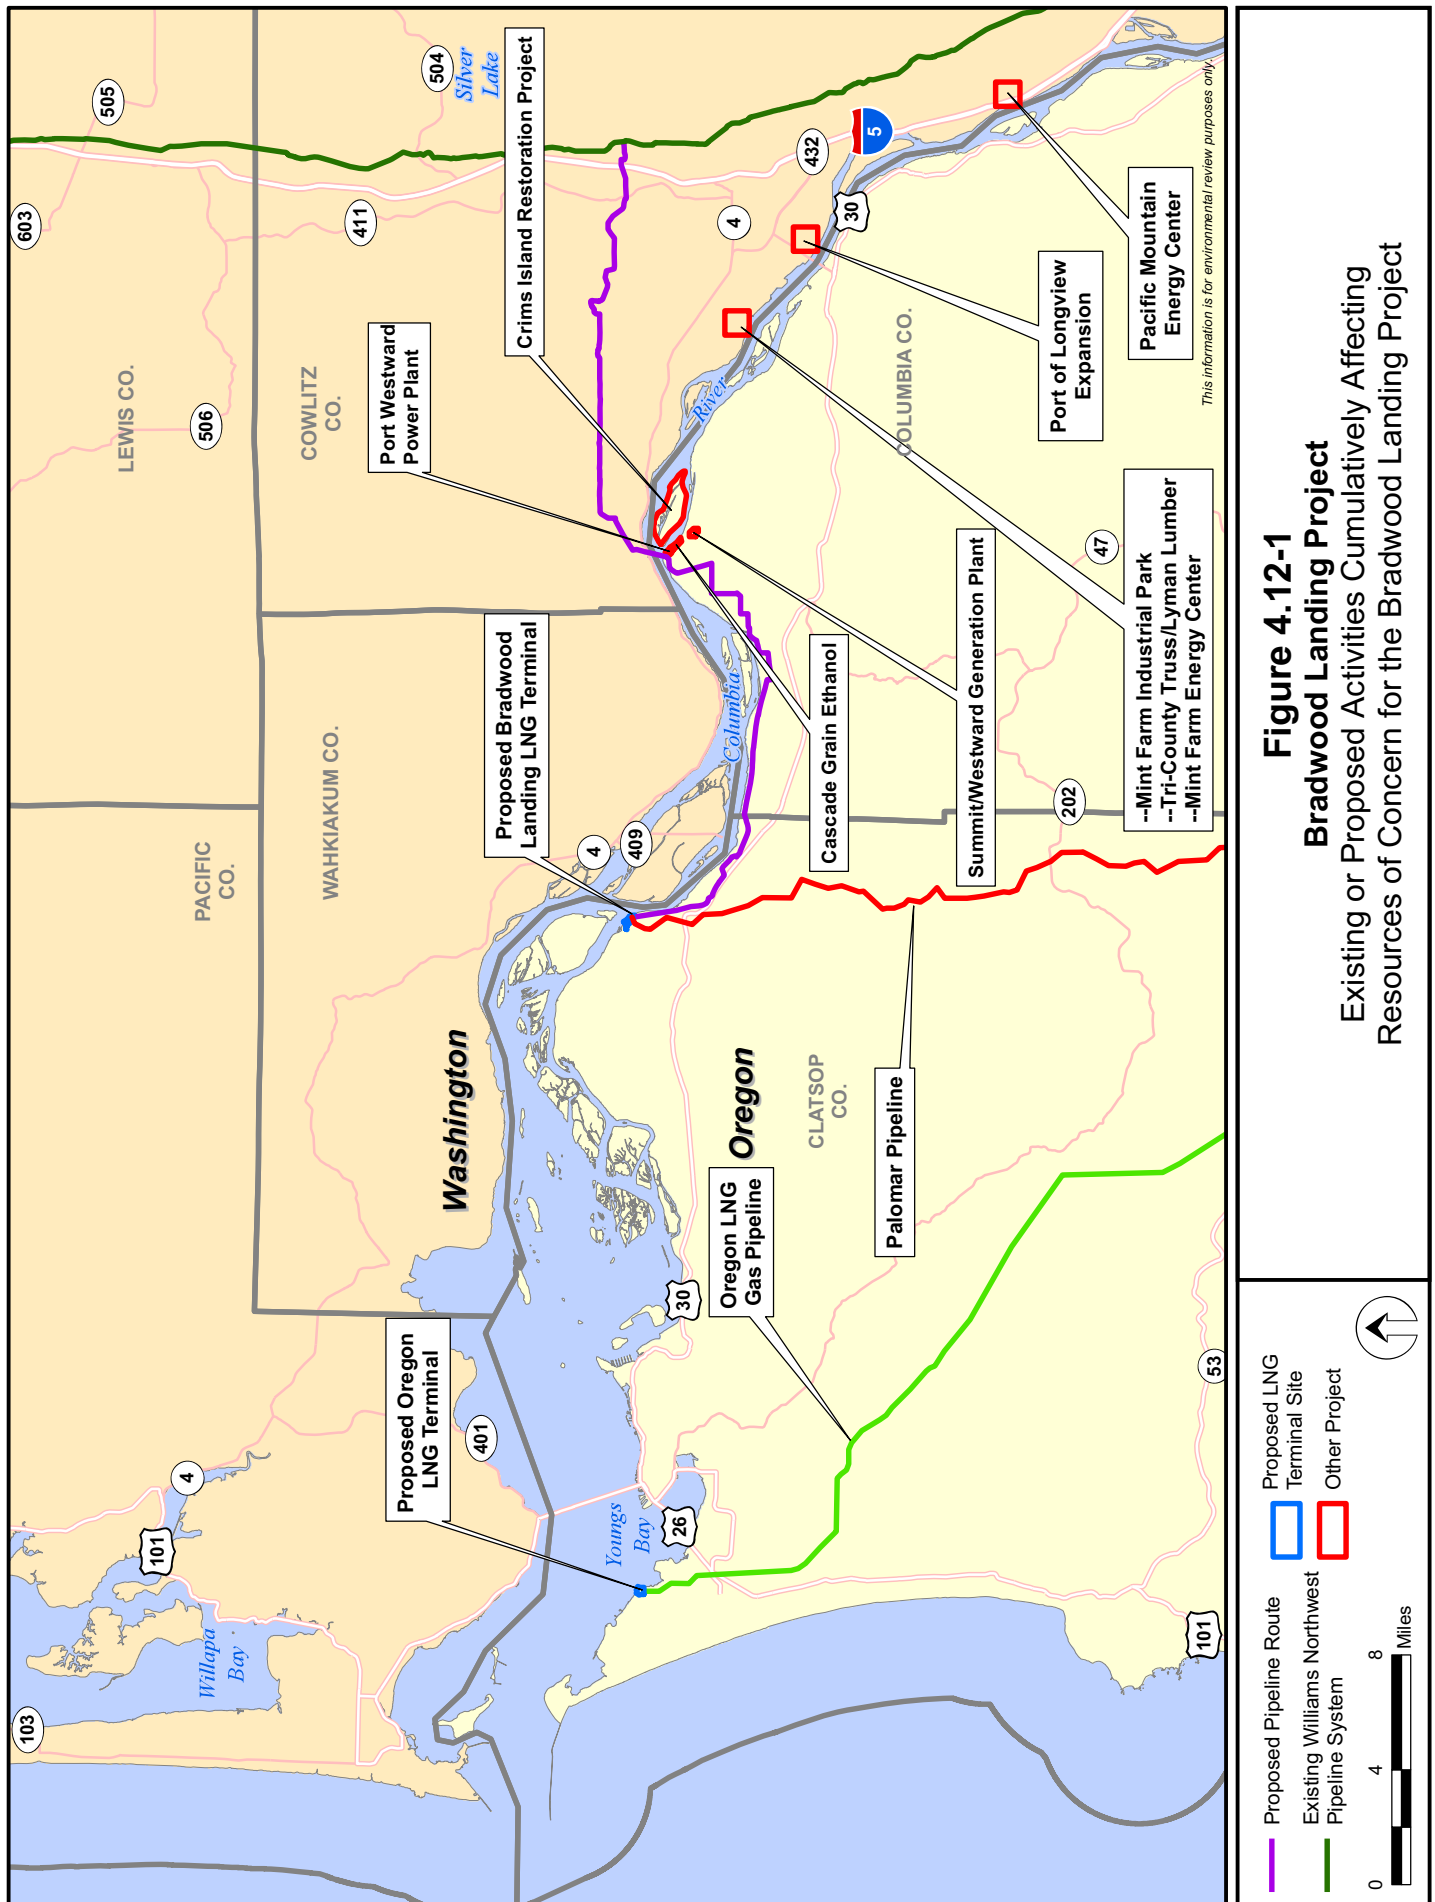

Existing or Proposed Activities Cumulatively Affecting Resources of Concern for the Bradwood Landing Project

Activity/Project	Description	Estimated Timeframe
Logging	Past and ongoing logging operations by companies such as Weyerhaeuser, Plum Creek, Boise Cascade, and Longview Fibre.	Ongoing
Dredging		
Columbia & Lower Willamette Navigation Project	Maintenance dredging of the Columbia River between CRMs 3 and 106.5, and to RM 11 in the Willamette River (within the City of Portland).	Ongoing
Mouth of the Columbia River	Annual maintenance of a 0.5-mile-wide navigation channel for about 6 miles between the Columbia River and Pacific Ocean.	Ongoing
Columbia River Channel Improvement Project	A combined ecosystem restoration and channel deepening project. Ecosystem restoration began in 2006 and primary dredging will be conducted through April 2008. Maintenance of the Columbia River Channel will be ongoing.	Through April 2008/ Ongoing
Maintenance Dredging Projects	Various maintenance dredging projects at the Port of Astoria, Port of Ilwaco, and the mouth of the Skipanon River	Ongoing
Restoration		
Salmon Recovery Strategy	Long-term strategy to recover threatened and endangered fish in the Columbia River Basin through increased water flow, habitat improvements, increased estuary productivity, hatchery reforms, selective fisheries, and reduced load following.	Ongoing
Crims Island Habitat Restoration	Restoration of tidal connectivity to emergent and forested marsh habitat and restoration of tidal marsh and riparian forest habitats.	2005 – 2008
Commercial Shipping	Past and ongoing cargo shipping between the mouth of the Columbia River and southern Idaho.	Ongoing
Commercial and Recreational Fishing	The lower Columbia River supports a number of valuable commercial and recreational fisheries, including salmon, steelhead, white and green sturgeon, eulachon, and bottom fish.	Ongoing
Recreational Boating	Past and ongoing recreational boating along the lower Columbia River includes kayaking, sailing, waterskiing, personal watercraft, and canoeing.	Ongoing
Cruise Ships	Seasonal cruise ship traffic occurring between the mouth of the Columbia River and the Port of Astoria.	Ongoing
Energy, Industrial, and Commercial Development		
Federal Columbia River Power System	System of hydropower projects on the Columbia River and lower Snake River. The closest of the 31 hydropower projects to the proposed Bradwood Landing LNG terminal is the Bonneville Dam, about 120 miles upriver.	Existing
Mist Underground Gas Storage Facility	Underground natural gas storage facility located near Clatskanie, Oregon.	Existing
Southwest Washington/ Northwest Oregon Reinforcement 500-kV Transmission Line Project	Electric transmission line expansion project; final route to be determined.	On Hold
Pacific Mountain Energy Center	An Integrated Gasification Combined Cycle power plant that will include one or two 300 MW combustion turbines and be located at the Port of Kalama, Washington.	2012
Oregon LNG Project	An LNG import terminal proposed to be located on 96 acres at the eastern Skipanon Peninsula along the Columbia River in Warrenton, Oregon. A 121-mile sendout natural gas pipeline would extend southeast and connect with the Williams Northwest Pipeline system in Clackamas County. The LNG terminal would receive up to about 100 LNG carriers annually, and 1.2 million cubic yards of material would be dredged for the turning basin and berth.	2009 – 2012 (construction)
Palomar Pipeline	A 220-mile-long, 36-inch-diameter, bidirectional natural gas pipeline from near Madras, Oregon to near Molalla, Oregon, then northwest to interconnect with various points on Northwest Natural's distribution system, with a potential extension to the Bradwood Landing pipeline.	2010 – 2012

TABLE 4.12-1 (cont'd)

Existing or Proposed Activities Cumulatively Affecting Resources of Concern for the Bradwood Landing Project

Activity/Project	Description	Estimated Timeframe
Port of Vancouver Columbia Gateway Project	Approximately 450 acres of new maritime and industrial development and more than 550 acres of wetland and habitat enhancement.	Potentially within the next 10-15 years
Port of Longview	The Port of Longview has 8 marine terminals and 300 acres of available industrial property located on the Columbia River, 66 miles from the Pacific Ocean. Industries located at and serviced by the Port include steel, over-dimensional, heavy-lift, forest products, dry bulk, and general cargo.	
Port of Longview Expansion	Construction and operation of a new terminal (Berth 8).	1999 – 2000
Mint Farm Industrial Park	The Mint Farm Industrial Park includes nearly 350 acres of land available for industrial development and is located in the City of Longview. Industries currently located at the park include steel and gelatin manufacturing.	
Tri-County Truss/Lyman Lumber	A 37-acre parcel that will have three companies in operation by 2010, including: TCT Truss-Longview, Woodinville Construction Services, and Woodinville Lumber-South.	2006 – 2010
Mint Farm Energy Center	Construction and operation of a natural gas-fired power plant located within the Mint Farm Industrial Park in Longview, Oregon.	TBD
Port Westward Industrial Area	The Port Westward Industrial Area is owned by the Port of St. Helens and includes over 800 acres of industrial land, including a deep-draft marine facility.	
Beaver Power Plant	PGE currently operates a 545 MW power plant.	Existing
Port Westward Power Plant	Construction and operation of a 400 MW natural gas-fired, combined-cycle combustion turbine plant adjacent to PGE's existing Beaver Power Plant. Plant includes a transmission line connecting to the Trojan Switchyard in Rainier, Oregon.	2004 – 2007
Cascade Grains Ethanol Plant	Construction and operation of a 100 million-gallon-per-year ethanol production facility.	2006 – 2008
Praxair CO ₂ Plant	Adjacent to Cascade Grain. Would use CO ₂ produced by the ethanol plant for commercial purposes.	2009
Summit/Westward Cogeneration Project	Natural gas combined-cycle combustion turbine system with 520-MW capability. In March of 2006, Westward Energy filed a request with Oregon Every Facility Siting for a Sixth Amended Site Certificate.	On hold
Columbia County	Road improvements and waterline expansion projects	Ongoing through 2009

Like the Bradwood Landing Project, both the Oregon LNG and Palomar projects would have components in Clatsop County, Oregon. Both the Oregon LNG and the Palomar projects, if expeditiously reviewed and authorized by the FERC, could be constructed within a time frame that overlaps with the construction of the Bradwood Landing Project, if it is authorized in 2008.

Other projects not involving the transmission of natural gas with the potential to cumulatively impact resources are generally concentrated into three general areas, including the Port Westward Industrial Area, Mint Farm Industrial Park, and Port of Longview (see figure 4.12-1). Construction schedules for the future projects depend on factors such as economics, funding, and politics. Projects and activities included in this analysis are generally those of comparable magnitude and nature of impact in the area that would be affected by the Bradwood Landing Project. More geographically distant projects were not assessed because their impact would generally be localized and, therefore, would not contribute significantly to cumulative impacts in the proposed project area. Cumulative impacts that could most directly be associated with the Bradwood Landing Project are discussed below.

We received a number of comments regarding the cumulative impacts of several natural gas projects currently proposed in Oregon, specifically Bradwood Landing, Oregon LNG, and Palomar pipeline. Because of the locations of these projects, the only resources that have potential for cumulative impacts would be air quality, certain socioeconomic resources, and in the case of Oregon LNG, resources that could be affected by dredging and LNG marine traffic. However, we have also provided information on other resources in this section in response to the comments we received.

4.12.1 Geology and Soils

The proposed Bradwood Landing LNG Project would have impacts on near-surface geology and soils. NorthernStar proposes to minimize these impacts through implementation of their ESC Plans and SWPPP as well as our Procedures. We are recommending that NorthernStar revise its pipeline ESC Plan and SWPP to include the measures from the FERC's Plan that provide greater protections. The final design for the Bradwood Landing LNG terminal would include detailed construction specifications, such as deep foundations and vibroflotation to compact soils and mitigate for seismic hazards. Along the pipeline route, NorthernStar would conduct additional studies and produce a Final Pipeline Design Geotechnical Report that provides measures to mitigate for the crossing of potential landslide hazards.

Because the direct effects would be highly localized, cumulative impacts on near-surface geology and soils would only occur if other projects are constructed in the immediate vicinity of the proposed Bradwood Landing Project. The Port Westward Industrial Area is about 12 miles from the proposed LNG terminal site and crossed by the proposed pipeline between MPs 18.0 and 19.0. Construction of the projects within the Port Westward Industrial Area, such as the Port Westward Power Plant, Summit/Westward Cogeneration Project, and the Cascade Grains Ethanol Plant, would require significant excavation or grading and would thus have impacts on near-surface geology and soils. However, construction of these three projects is currently scheduled to be completed before general construction of the pipeline. While there would be potential for cumulative impacts on geological resources and soils if these projects were constructed concurrently with the pipeline, any cumulative impact on geology and soils would be minimized by the implementation of erosion control and restoration measures during construction and restoration of the projects. Consequently, any potential cumulative impacts on geological resources and soils would be minor.

We have no information about impacts on soils or geological resources along the proposed Palomar pipeline, because Palomar has not yet filed its first draft environmental Resource Reports with the FERC. However, only a small portion of the Palomar pipeline would be constructed in proximity to

the Bradwood Landing Project. Consequently, we would not expect a significant cumulative impact on soils and geologic resources.

The Oregon LNG import terminal would be located in an area where dredged materials were deposited, and consists of soils that have a high potential for erosion and poor revegetation potential. About 10 acres at the terminal are classified as prime farmland, although the area was never farmed. The Oregon LNG sendout pipeline would cross 155 mapped soil units. About 45 percent of the route would cross soils which have high potential for water erosion, and 47 percent of the route would cross soils with poor potential for revegetation. About 58 percent of the pipeline route would cross soils classified as prime, unique, or important farmland. Oregon LNG would mitigate impacts on soils by following the FERC's Plan, and its own project-specific Agricultural Impact Mitigation Plan.

Like the Bradwood Landing Project, the Oregon LNG Project would be located within the area influenced by the CSZ. In the case of a seismic event, peak ground accelerations would occur at the proposed Oregon LNG import terminal site, and would decrease along the pipeline eastward. The proposed Oregon LNG pipeline would cross numerous earthquake faults, including the Gales Creek Fault Zone, Mount Angel Fault Canby-Molalla Fault, and Newberg Fault. The Oregon LNG terminal would be located within a mapped tsunami inundation boundary, and risks of inundation are high until about MP 2 of the sendout pipeline. There is also the potential for landslides between MPs 6 and 60 of the pipeline, where it would cross steep slopes over unstable underlying geologic formations. To mitigate for the potential for liquefaction at the Oregon LNG terminal as a result of an earthquake, Oregon LNG would perform ground improvements below critical facilities, including driving piles and jet grouting or cement soil mixing. Along the pipeline route, Oregon LNG would attempt to avoid steep slopes and landslide hazard areas. In situations where these areas cannot be avoided, Oregon LNG would conduct a geological evaluation, install strain gauges where soil creep is anticipated, bury the pipe deeper at some locations, follow the FERC's Plan, and use proper construction and drainage techniques.

Shoreline erosion along the Columbia River is caused by river currents, wind waves, and ship wakes. River currents can erode banks and carry sediment away from the shoreline. Wind waves and ship wakes can also erode banks but they only move sediment locally within the shallow water zone near the shore. The amount of erosion that occurs at a particular location depends on the interaction between the eroding forces of river currents and waves and the resisting forces of the river bank (COE, 1999). As discussed in section 4.1.2.3, the size of waves produced by a vessel passing through a channel depends on the characteristics and speed of the vessel and the characteristics of the channel. However, speed is the most important factor influencing the size of waves produced by a vessel. Large waves contain more energy than small waves and thus, have a greater ability to erode river banks. NorthernStar commissioned a study of wave generation by LNG carriers compared to other large ships along the Columbia River, which indicated that waves generated by LNG carriers for the Bradwood Landing Project would be only slightly larger than those generated by other large ships along the Columbia River operating at the same speed.

Operation of the Bradwood Landing Project and other projects (i.e., Tri-County Truss/Lyman Lumber) would result in increased ship transit up and down the Columbia River. Also, the Oregon LNG Project would, if approved, add an estimated 100 LNG carriers per year transiting to CRM 11.5 beginning as early as 2012. The overall increase in ship traffic would be offset at least in part by the general decreasing trend in ship traffic volume in recent years. The Columbia River Channel Improvement Project will allow larger, deeper draft ships to travel the river.

In a 100-year flood, water may rise up to 9 feet above the current elevation at the location proposed for the Oregon LNG terminal. Oregon LNG indicated that it would need to conduct an evaluation to determine appropriate shoreline erosion control measures for its proposed LNG terminal.

In conclusion, we have determined that the potential impacts on geology and soils, considering the Bradwood Landing Project cumulatively with other past, present, and reasonably foreseeable projects, would not be significant.

4.12.2 Waterbodies and Wetlands

As discussed in sections 4.3.2.2 and 4.3.2.3, the Columbia River is currently considered marginally healthy by the COE, and is water quality limited for temperature, mercury, and arsenic. These water quality conditions reflect both historic and modern activities within and along the river. There are several plans currently in place to improve environmental conditions within the Columbia River, including the *Lower Columbia River Salmon Recovery and Fish & Wildlife Plan*, which was adopted by the NMFS as the *Interim Regional Recovery Plan of the Washington Management Unit for the Lower Columbia River* on February 3, 2006; the *Northwest Power and Conservation Council Fish and Wildlife Program Subbasin Plan for the Lower Columbia Mainstem and Estuary*; the *Lower Columbia River Estuary Program Comprehensive Conservation and Management Plan*; and the *Lower Columbia River Salmon Recovery and Fish & Wildlife Plan*, which is currently being drafted.

In the foreseeable future, there will likely be a number of projects or activities that result in additional stresses on water quality in the lower Columbia River basin, including several of the waterfront projects listed in table 4.12-1 (e.g., Tri-County Truss/Lyman Lumber, Beaver Power Plant, Port Westward Power Plant, Cascade Grains Ethanol Plant, Columbia Tidal Energy Hydroelectric Project, Mint Farm Energy Center, and ongoing maintenance dredging) as well as the Bradwood Landing Project and the Oregon LNG Project.

The Bradwood Landing Project would affect surface water quality (see sections 4.3.2, 4.5.1, and 4.5.2). Specific project-related activities that could have impacts on waterbodies include dredging, dredge disposal, hydostatic testing, water intake by LNG carriers at the berth for ballast and engine cooling, water disposal from operation of SCVs at the LNG terminal, wastewater and stormwater runoff, upland clearing and grading, and pipeline installation. Those activities may:

- increase water turbidity;
- increase water temperature;
- increase erosion;
- cause the filling of wetlands; and
- introduce hazardous materials through potential spills.

Potential construction impacts on waterbodies would be minimized by NorthernStar's compliance with our Plan and Procedures, as well as its SWPPP, ESC Plans, and HDD Contingency Plan. Nevertheless, the Bradwood Landing Project could contribute to cumulative impacts on water quality when considered in combination with other past, present, and reasonably foreseeable projects that may also have impacts on waterbodies within the lower Columbia River basin. The Oregon LNG Project would have impacts on water quality similar to the Bradwood Landing Project. The Oregon LNG sendout pipeline would cross about 190 waterbodies. The proposed Palomar pipeline would cross about 180 waterbodies. Oregon LNG and Palomar would also follow the FERC's Procedures to lessen or mitigate impacts on waterbodies.

Impacts from dredging could be compounded if other significant dredging projects were conducted concurrently at a nearby location (e.g., the Columbia River Channel Improvement Project). The COE is expected to complete its deepening of the navigation channel in the area of the Bradwood Landing site before construction on the proposed LNG terminal would begin. In addition, smaller maintenance dredging projects on the Columbia River are in the preliminary stages, including at the Port

of Astoria, the Port of Ilwaco, and at the mouth of the Skipanon River. The volumes of dredged material at these sites would be much less than the proposed project (Ellis, 2008). Oregon LNG expects that construction of its terminal berth and turning basin would require dredging of about 1,275,000 cubic yards of material. It has not yet stated its preferred placement location for those dredged materials. Permits for dredging in Oregon would be needed from the COE and ODSL, and these agencies would likely impose conditions to mitigate for impacts. There would be a permanent loss of some existing wetlands as a result of construction and operation the proposed Bradwood Landing Project, Oregon LNG Project, Palomar Project, and other reasonably foreseeable future projects located within the Port Westward Industrial Area and Mint Farm Industrial Park. The Bradwood Landing Project would temporarily impact about 15 acres of wetlands at the terminal and 76 acres along the pipeline during construction, and permanently affect about 28 acres total of wetlands during operation of the project. The Oregon LNG terminal would temporarily impact about 21 acres of wetlands during construction, and permanently impact about 15 acres of wetlands during operation. Its sendout pipeline would cross about 240 wetlands. NorthernStar, Oregon LNG, and Palomar would all follow the FERC's Procedures to reduce impacts on wetlands.

The primary cumulative impact associated with dredging is turbidity. Turbidity impacts associated with the projects discussed in this section would be of a short duration and would not be expected to overlap spatially with the Bradwood Landing Project. That is, the turbidity plumes associated with dredging would not likely be additive. Consequently, turbidity impacts are cumulative only in the sense that a single body of water would incur these impacts. Given the volume and dynamic nature of the Columbia River, we would not expect water quality impacts to be cumulatively significant.

These projects would need to obtain permits from the COE, ODSL, ODEQ and WDE to cross or fill wetlands. NorthernStar has drafted a Compensatory Mitigation Plan that proposes measures to be implemented to mitigate for temporary and permanent wetland impacts. That plan calls for the creation of new wetlands or restoration and improvement of habitats at three locations (Hunt Creek, Svensen Island, and Delameter Creek). Oregon LNG also drafted a conceptual *Waterbody and Wetland Construction and Mitigation Procedures Plan* that indicates that it would restore wetlands temporarily impacted, replace lost wetland functions within the same watershed, and purchase mitigation credits. Therefore, the creation of new wetlands and the enhancement of existing wetlands would result in a net increase in regional wetland resources.

4.12.3 Vegetation and Wildlife

When projects are constructed in close proximity at or close to the same time, they have a cumulative impact on vegetation and wildlife occurring in the area where the projects are built. Vegetative clearing and grading and other construction activities associated with the Bradwood Landing Project, along with other construction projects, would result in the removal of vegetation; alteration of wildlife habitat; and displacement of wildlife. Other secondary impacts on vegetation and wildlife include edge effects along the pipeline right-of-way in cleared forest, increased opportunities for predation, and establishment of invasive plant species. These effects would be greatest if the other projects were to be constructed within the same timeframe and geographic area as the Bradwood Landing Project, impacting similar habitats used by the same species.

The proposed Bradwood Landing pipeline would be located adjacent to the existing KB pipeline for 8.0 miles (22 percent of the total route). Construction of the pipeline would affect about 553 acres; of which about 180 acres would be forest. Impacts on forest are considered more severe than effects on other vegetation because a 30-foot-wide corridor over the centerline would be kept permanently cleared of large trees (totaling about 54 acres along the Bradwood Landing pipeline), while it would take some time for forest to regenerate in the temporary work areas. NorthernStar would reduce impacts on

vegetation through implementation of the measures outlined in its pipeline ESC Plan in Oregon and its SWPPP in Washington, and its Noxious Weed and Soil-borne Disease Control Plan. Except within 15 feet of the pipeline, in-kind trees would be replanted, and NorthernStar's proposed tree planting exceeds the revegetation requirements of the FERC staff's Plan and Procedures.

The majority of the areas within the Port Westward Industrial Area, Mint Farm Industrial Park, and Port of Longview have previously been cleared for industrial development. Because native vegetative communities have been substantially altered at these areas, the cumulative impact of these proposed projects on vegetation is expected to be minor.

About 30 percent of the route for the Oregon LNG sendout pipeline would follow existing rights-of-way, along roads, railroads, and power lines. About 38 percent of the route of the proposed Palomar pipeline would parallel existing rights-of-way. Construction of the Oregon LNG pipeline would affect a total of about 1,461 acres. Forested land along the Oregon LNG pipeline includes the Coastal Uplands, Volcanoes, Willapa Hills, and Willamette River Gallery Forest ecosystems, where construction is expected to clear a total of about 670 acres. Construction of the Palomar pipeline would affect about 3,070 acres. At this time we do not have an estimate for the amount of forest that may be cleared along the Palomar pipeline, but it would cross portions of the Mount Hood National Forest, and Tillamook and Clatsop State Forests.

Cumulative impacts on vegetative communities would be minimized for the FERC regulated projects (Bradwood Landing, Oregon LNG, and Palomar) because they would follow the FERC staff's Plan and Procedures, and implement restoration plans, including reseeding and replanting of vegetation. They may also implement project-specific mitigation measures designed to minimize the potential for erosion, and control the spread of noxious weeds, thereby reducing the degree and duration of their cumulative impacts on vegetation. For example, the Oregon LNG pipeline would cross portions of the Clatsop and Tillamook State Forests, and when crossing those lands Oregon LNG would implement measures consistent with the Northwest Oregon State Forest Management Plan.

Construction of the Bradwood Landing Project at the same time as other projects listed in table 4.12-1 could cause cumulative impacts on coldwater anadromous fisheries, and designated EFH. The geographic extent and duration of disturbances to waterbodies that may affect aquatic species would be minimized for the FERC regulated projects, because they would follow the FERC staff's Plan and Procedures, and would implement project-specific mitigation plans. Additionally, the projects that would involve direct in-stream impacts on anadromous fisheries and other waterbodies designated as EFH would need permits and authorizations from the COE, ODSL, and WDE, and would consult with the ODFW, WDFW, NMFS and FWS. These agencies would require measures to mitigate impacts on aquatic resources. NorthernStar's SEI would be a voluntary program to ensure the future recovery of salmon and the lower Columbia River ecosystem, separate from its other mandatory avoidance and mitigation measures

There are currently about 1,800 commercial ships that call on ports along the lower Columbia River, with about 66 percent of this traffic docking at Portland, 18 percent docking at Vancouver, and 10 percent docking at Longview. We estimate that all of these commercial ships combined intake as much as 10.4 billion gallons per year in ballast water while at dock. We estimate that LNG carriers at the Bradwood Landing LNG terminal berth may take in about 3.1 billion gallons of ballast water per year. LNG carriers at the proposed Oregon LNG terminal may take in an additional 1.3 billion gallons of ballast water per year. The average flow of the Columbia River past Bradwood Landing is about 136 billion gallons per day. The additive water withdrawals for ballast of all current commercial ship traffic on the lower Columbia River, plus future traffic in LNG carriers docking at the Bradwood Landing and Oregon LNG terminals, would total about 14.8 billion gallons per year, which represents about 0.03

percent of the average river flow. To reduce impacts on juvenile fish from intakes for carrier ballast at the Bradwood Landing terminal, NorthernStar would screen all river water withdrawals. We are recommending that either all LNG carriers calling at the Bradwood Landing terminal be retrofitted to use NorthernStar's filtered water system, or NorthernStar would need to file another system design to deliver screened water to non-retrofitted LNG carriers.

The Bradwood Landing Project, in combination with the other projects that may take place in the general geographic region and same time period may have cumulative impacts on animal and plant species and their critical habitat that are listed as threatened or endangered federally and/or by the States of Oregon and Washington. We have identified 36 federally listed threatened and endangered species in the Bradwood Landing project area. The project may affect 13 salmonid ESU/DPS, and the Columbian white-tailed deer. NorthernStar has committed to implement its Compensatory Mitigation Plan, which has been designed to exceed existing mitigation standards and would result in substantially larger areas being restored and/or protected than would be lost to permanent impacts and would be restored to a higher level of ecosystem function. Although the Compensatory Mitigation Plan would benefit a variety of aquatic and terrestrial species, it was designed with additional emphasis on protection and restoration of habitat for federally listed salmonids and the Columbian white-tailed deer. We produced a BA and EFH Assessment for the Bradwood Landing Project in March 2007 that is currently being revised to address comments from the FWS and NMFS.

Along the route of the Palomar pipeline, Palomar identified potential habitat for 20 federally listed species, including the marbled murrelet and the northern spotted owl, and 17 state listed species. Oregon LNG identified 15 fish species, 4 sea turtles, 8 marine mammals, 4 bird species, 1 invertebrate, and 2 plants that are federally listed within its project area.

Both Palomar and Oregon LNG would need to provide a plan for the mitigation of impacts on listed species, prepared in consultation with the ODFW, FWS, and NMFS. Using those mitigation plans, the FERC would produce BA and EFH Assessments for these projects, for review by the FWS and NMFS, who, in their BOs for these projects, may require additional conditions to protect or mitigate impacts on sensitive species. Therefore, although construction and operation of the Bradwood Landing Project along with the other potential projects and activities would result in impacts on aquatic and terrestrial resources, cumulative impacts on federally listed species and their designated critical habitat would be minimized through consultations with the NMFS and FWS, as required under the ESA.

4.12.4 Land Use, Recreation and Special Interest Areas, and Visual Resources

The proposed project and the other foreseeable future projects would result in both temporary and permanent changes to current land uses. The Bradwood Landing LNG terminal would be constructed on a tract of land that was previously used as a lumber mill and for dredged material placement. On March 20, 2008, Clatsop County changed the land use zoning for the proposed Bradwood Landing Project so that the terminal and pipeline would be allowed uses, with certain conditions. The proposed pipeline route would affect agricultural, forest, rangeland, open, commercial/residential, and water land uses. NorthernStar would continue to consult with Columbia County, Oregon, and Cowlitz County, Washington about the installation of its pipeline in a manner that would be consistent with county land use plans and guidelines. Cowlitz County, Washington can adopt this EIS for its SEPA needs.

The majority of the projects listed in table 4.12-1 occur within the Port Westward Industrial Area and Mint Farm Industrial Park, which occupy about 1,150 acres of land. These areas have been developed specifically for commercial and industrial facilities, and significant impacts on land use would not be expected.

About 35 percent of the proposed Palomar pipeline would cross public lands, including about 2 miles of land administered by the BLM, 47 miles within the Mount Hood National Forest, and 24 miles of state of Oregon lands. However, we have no additional data, yet, about potential land use conflicts related to the Palomar Project. The Bradwood Landing pipeline would have no direct impacts on national, state, or local parks or recreational facilities. It would avoid islands that form a part of the JBHNF, and the Lower Columbia River Water Trail, by using the HDD method to cross under the Columbia River. The Oregon LNG sendout pipeline would cross one proposed national wildlife refuge and two state forests. The Oregon LNG terminal would be located on a 96 acre parcel owned by the ODSL and leased to the Port of Astoria, within the City of Warrenton, that is zoned for industrial development. The proposed sendout pipeline for the Oregon LNG Project would cross mostly forest (48 percent) and agricultural land (44 percent). We discussed how impacts on vegetation would be addressed above.

The Bradwood Landing Project, in combination with the other foreseeable regional projects listed on table 4.12-1 could result in cumulative impacts on recreational or special interest areas if these projects would affect the same area or feature (e.g., trails) at the same time. As discussed in section 4.7.1.4, high levels of recreational fishing and boating occur during the summer months along the lower Columbia River (averaging about 300 private fishing boats in the waters of the Columbia River estuary per day between June and August). River users may be affected by the additional marine traffic of 275 LNG carriers per year entering the lower Columbia River navigation channel going to the Bradwood Landing Project and Oregon LNG Project combined. However, the LNG carriers on the waterway to the Oregon LNG terminal would only transit about 11.5 miles up the Columbia River from its mouth to the location of the terminal in Warrenton. Because recreational users of the Columbia River have always had to account for commercial ship traffic, no significant additional cumulative impacts on these activities are likely. Recreational boats would merely need to briefly move out of the way of passing LNG carriers, much as they currently do for other commercial ships. In addition, the Coast Guard, in its WSR and LOR, would impose conditions on LNG carriers in the water to protect and resolve conflicts with other river users.

LNG marine traffic on the waterway to either the Bradwood Landing LNG terminal or the Oregon LNG terminal would pass by parks and trails that would be overlapped by the Zones of Concern. This includes elements of the LCNHP at Fort Stevens and Cape Disappointment State Parks, the LCNHT, the Lower Columbia River Water Trail, Hammond Marina, and the Warrenton Waterfront Trail and Carruthers Park. However, with the implementation of the Coast Guard's requirements for safety and security, the likelihood of an incident resulting in an LNG spill is extremely low, and users of regional parks and trails should not be adversely affected by these proposed projects. Visual impacts on park and trail visitors from LNG marine traffic would be limited, because the viewshed already includes commercial ship traffic of up to 2,000 vessels per year, and because the LNG carriers would take only a few minutes to travel through the viewshed in the waterway at speeds between 8 to 12 knots.

Most of the projects listed in table 4.12-1 are located in previously developed commercial or industrial areas associated with the Port Westward Industrial Area, Port of Longview, and Mint Farm Industrial Area. Construction and operation of new buildings or structures associated with these projects, including those at the proposed LNG terminal, would have a permanent effect on visual resources. However, the cumulative impacts would not be significant, because the facilities would be seen in the context of existing facilities in the area and would not adversely affect the viewshed from sensitive locations or change the character of the landscape in terms of either physical characteristics or land uses. The existing facilities at the Port Westward Industrial Area, Port of Longview, and Mint Farm Industrial Area would screen, backdrop, and otherwise minimize the overall impact on visual resources from these projects to less than significant levels.

The most visible elements of the LNG projects would be the LNG storage tanks, which would be about 170 feet high and 260 feet wide. Other visual elements associated with the LNG project include nonjurisdictional power lines. The Oregon LNG Project would contribute to cumulative visual impacts along the waterway but would be 27 miles from the Bradwood Landing Project. The Oregon LNG terminal would be visible to viewers in Warrenton and Astoria, with a combined population of about 14,000 people. The Bradwood Landing LNG terminal would be most readily visible to residents of Clifton, Puget Island, and Cathlamet, with a combined population of about 1,370 people. NorthernStar would reduce visual impacts of its terminal by implementing a lighting plan, painting the storage tanks to blend into the background of the forested hills, and planting trees along the berm around the process area.

The Bradwood Landing, Oregon LNG, and Palomar pipelines would be installed beneath the ground surface. Once their rights-of-way are properly restored and revegetated, they should not represent significant visual elements, subordinated within the existing landscape character, with the exception of the treeless portion of their permanent easements through what is currently forest. We have discussed impacts of those projects on vegetation above. The cumulative visual impacts of these combined projects would be reduced within the context of the existing landscape, which already includes land uses that have altered that landscape, including timber harvesting activities, farming and other agricultural activities, industrial, commercial, and residential developments, and infrastructure such as roads and power lines.

4.12.5 Socioeconomics

Present and reasonably foreseeable future projects and activities could cumulatively impact socioeconomic conditions in the project area. Employment, housing, infrastructure, public services, and traffic could experience both beneficial and detrimental impacts. None of the projects appear to have environmental justice issues.

Economy and Employment

The projects considered in this section would have cumulative effects on employment during construction if more than one project is built at the same time. The Bradwood Landing Project expects to employ up to 750 workers during the peak construction months. NorthernStar anticipates that most of the labor force for construction of the project would come from the four-county project area, or from the Portland MSA. Approximately 20 non-local specialty workers and managers may be hired for the Bradwood Landing Project. If several of the larger projects, such as the Summit/Westward Cogeneration, Palomar, and Oregon LNG projects, are built simultaneously, the demand for workers could exceed the local supply of appropriately skilled labor. Construction of the Oregon LNG terminal is expected to require an average of 456 construction workers during a 44-month-long period, with 60 percent being hired within Oregon. The Portland MSA and four-county project area has a civilian labor force of about 5,893,060 people and an average unemployment rate of 6.6 percent. This suggests that the local labor force could meet some of the employment needs induced by construction of these projects, although it is unknown whether a sufficient number of these unemployed persons have the necessary skills to work on these projects. If all the major projects in the region are constructed during the same time period, and the demand for local workers exceeds supply, it is assumed that the remainder of the employment positions would be filled by non-local hires.

Operation of the Bradwood Landing Project would employ about 65 permanent workers. In addition, tug operations required to support the terminal would require about 40 employees. The Oregon LNG Project would likely have 63 permanent operational employees. Based on the current commuting patterns of workers at Wauna Mill, almost all of the operational workers for the LNG terminal projects are expected to come from the local four-county area. Additional tug operators may need to be brought in from outside of the area if not enough local workers that are trained or willing to be trained are available.

These projects are expected to have cumulative benefits for the local economy in terms of direct payroll expenditures, purchase of supplies and materials, indirect employment in service sector, and taxes. As discussed in sections 4.8.2.4 and 4.8.3.4, the estimated payroll for the proposed Bradwood Landing Project would be about \$110 million during the construction phase, and direct expenditures for goods, equipment, and services would total \$88 million. The total indirect and induced effect of the Bradwood Landing Project would be about \$77 million, with annual property taxes anticipated to be \$7.7 million during operation of the LNG terminal. The Oregon LNG Project estimates that it could spend up to a total of \$361 million on labor costs, and \$672 million on material purchases. Annual property taxes during operation of the Oregon LNG terminal would be about \$6.8 million to Clatsop County, Oregon.

Housing

NorthernStar would mostly employ local workers who would reside within commuting distance of the project. For the proposed Bradwood Landing Project, an estimated maximum of 20 housing units would be needed per month to accommodate the non-resident construction workforce. If 40 percent of the work force hired by the Oregon LNG Project were non-local, about 300 workers may require housing. The non-local workers would be expected to rent houses, apartments, hotel/motel rooms, or stay in recreational vehicle camps. The total housing unit vacancy rate in Clatsop County, Oregon is about 25 percent. According to Oregon LNG, the vacancy rates for hotels/motels in Astoria range from almost 80 percent in the winter to 50 percent in the summer. We estimated that there were a total of about 1.2 million housing units in the four counties affected by the Bradwood Landing Project and the Portland MSA (see section 4.8.2.2). Given the vacancy rates, the number of housing units, and the availability of hotel/motel rooms and campgrounds in the region, it is not anticipated that construction crews would encounter difficulty in finding temporary housing. If construction occurs concurrently with other projects, temporary housing would still be available but may be slightly more difficult to find and/or more expensive to secure during the summer tourist season. Regardless, these effects would be temporary, lasting only for the duration of construction, and there would be no long-term cumulative effect on housing.

Infrastructure and Public Services

The cumulative impact of the Bradwood Landing Project and the other projects listed in table 4.12-1 on infrastructure and public services would depend on the number of projects under construction at one time. The area has a relatively small number of police, fire, and emergency service personnel (see section 4.8.1.6, 4.8.2.6, and 4.8.3.6); therefore, if several projects were to be constructed at once, the incremental demands of those projects could become difficult for police, fire, and emergency service personnel to address.

NorthernStar has indicated that trained personnel and fire fighting equipment would be maintained at the LNG terminal in the event of an emergency. NorthernStar has produced a draft ERP, which, in accordance with the EPAct, includes a cost-sharing plan that outlines how NorthernStar would fill resource gaps and supplement the first-responder capabilities of the local communities near its proposed LNG terminal. The draft ERP will be reviewed by the FERC and Coast Guard, and revised accordingly. The Oregon LNG Project would also be required to have an ERP and cost-sharing agreement for emergency services in place. The additional emergency resources required for a second LNG facility on the lower Columbia River may be less than those needed for the first because a fire or other incident would be unlikely to occur at both facilities or on two LNG carriers at the same time. Therefore, it is possible that certain emergency response resources could be shared. With implementation of the ERPs, no long-term cumulative effect on infrastructure and public services is anticipated.

Transportation and Traffic

Road Traffic

The cumulative impacts associated with the construction of several of the projects listed in table 4.12-1 at the same time would include construction equipment traffic and worker commuting traffic. Both construction equipment and workers constructing the Bradwood Landing LNG Project would use Highway 30 as a main access route in Oregon, but construction equipment and workers may also travel on Highway 4 in Washington. Both Highway 30 and Highway 4 may be used during construction of other projects in Longview and Port Westward. Construction of the Oregon LNG terminal is expected to mainly have traffic impacts on Highway 105 and Highway 101 in the Warrenton/Astoria area; thus it would not add cumulative impacts on traffic for the roads used by construction vehicles for the Bradwood Landing Project.

As discussed in section 4.8.2.7, an independent traffic study for the Bradwood Landing Project counted 6,200 daily trips along Highway 30 at Clifton Road. During construction of its LNG terminal, NorthernStar anticipates an average of 30 project-related trucks a day. NorthernStar would make improvements to Clifton Road to handle construction traffic. In addition, it would bus in workers from a parking lot near Taylorville. We have recommended that NorthernStar produce a final traffic management plan, in consultation with Clatsop County and ODOT, to mitigate impacts on other road traffic.

Pipeline construction equipment would use local access roads and the right-of-way. Some roads crossed by the pipeline may be open cut, which could temporarily disrupt other road traffic. However, these roads are in rural areas that do not have high volumes of traffic. NorthernStar would apply for necessary local permits for road crossings and comply with permit stipulations. NorthernStar would consult with the affected counties to address traffic flow and control issues and minimize impacts. Potential cumulative impacts on road traffic from construction of any of these projects located in close geographic proximity during the same time period would be minor and short term.

Ship Traffic

Annual commercial ship traffic at the mouth of the Columbia River in recent years has been roughly 2,000 round-trips, with a downward trend since 2000 (Kraley, 2006). It is estimated that the number of ship trips along the Columbia River has decreased by roughly 25 percent in the last 20 years while the volume of cargo has remained relatively stable. This indicates a greater reliance on bigger ships, many of which are similar in size to the LNG carriers that could transit to the Oregon LNG terminal or Bradwood Landing. In order to better accommodate the large vessels making calls on ports along the Columbia River, the COE is deepening the navigation channel from 40 to 43 feet (Columbia River Channel Coalition, 2006).

If both the Oregon LNG Project and the Bradwood Landing Project were authorized and built within a similar time period, there may be as many as 275 LNG carriers per year entering the lower Columbia River. That would represent an increase of about 14 percent above current levels of commercial ship traffic, but would still not approach historic highs in past commercial ship traffic on the Columbia River.

Operation of the Tri-County Truss/Lyman Lumber facilities at the Mint Farm Industrial Park would also result in an increase in ship traffic along the Columbia River, although the quantity of additional ship traffic these facilities would generate is currently unknown. In addition, the Port of Vancouver Columbia Gateway project could add about 365 deep-draft cargo ships per year. However,

the industrial development district levy that would have funded the project failed to pass in August 2007. The Port of Vancouver indicates that the project could “potentially” be developed in 10 to 15 years (Port of Vancouver, 2008). However, because shipping activity within the Columbia River would remain below historic levels, combined with the fact that the Columbia River is currently undergoing channel deepening to better accommodate large vessel traffic, we do not expect that operation of other projects would have significant cumulative impacts on commercial ship traffic on the Columbia River.

LNG marine traffic on the waterway may cause some delays for other commercial ship traffic, due to the timing of crossing of the Columbia River Bar, safety and security zones, and non-passing zones. However, a study conducted for NorthernStar indicated that half the time an LNG carrier would be crossing the bar it would not encounter any other commercial ships, and only 20 percent of the time would an LNG carrier cause a delay for another commercial ship at the bar. The worst case scenario is that another ship would have to wait an entire tidal cycle to cross the bar. However, with proposed navigation protocols, scheduling priorities, pro-active communication between LNG carriers and other commercial ships, and coordination between pilots and the Coast Guard, delays would be minimized.

4.12.6 Cultural Resources

There are no statutory requirements that privately developed projects protect cultural resources, unless a federal license, permit, or funding would be involved, or the project would affect other public lands. Under Oregon regulations, permits would be required from the Oregon SHPO in order to conduct cultural resources surveys on non-federal public lands, and to excavate archaeological sites on non-federal public and private lands. If there is a federal nexus, the project must comply with section 106 of the NHPA and take the impacts of the undertaking on historic properties into consideration. The proposed projects listed in table 4.12-1 that are defined as federal actions, such as Oregon LNG and Palomar Pipeline, would need to consult with the SHPO, identify historic properties that may be affected, and implement measures to resolve impacts on affected properties. Non-federal actions would need to comply with whatever conditions may be imposed by the state or local permitting agencies with regards to the protection of cultural resources.

We have not yet completed compliance with section 106 of the NHPA for the FERC regulated projects, because surveys for the entire APE cannot be done until after the FERC issues an Order, and the applicants would have access to lands where it was previously denied. There is a known significant archaeological site (35CO16) at Port Westward that Columbia County should take into consideration when planning or authorizing future actions in its Industrial Zone. The Bradwood Landing pipeline would avoid impacts on site 35CO16 by using an HDD under the Columbia River. We and the SHPO agree that the Bradwood Landing Project would not adversely affect the LCNHT and ACRR. Along the Oregon LNG pipeline, nine sites were identified that require additional work to evaluate their NRHP eligibility. However, the Oregon LNG pipeline and Bradwood Landing pipeline are not located in the same geographic area, and would not have cumulative impacts on cultural resources.

4.12.7 Air Quality and Noise

Construction of most of the reasonably foreseeable future projects listed in table 4.12-1 would involve the use of heavy equipment that would produce noise, air contaminants, and dust that would contribute cumulatively to impacts on air and noise quality. The counties that could be affected by the Bradwood Landing Project are currently in attainment with air quality standards, or are unclassified. Cumulative impacts on air quality would be limited primarily to areas where more than one project is proposed within the same airshed. Portions of the Oregon LNG and Bradwood Landing Project would overlap, especially for LNG carrier traffic in the waterway up to CRM 11.5; and both proposed LNG import terminals would be located in Clatsop County, Oregon. We estimate that if both the Oregon LNG

Project and the Bradwood Landing Project are authorized and built, there would be cumulative impacts on local air quality from LNG marine traffic in the waterway. It is not currently feasible to exactly model air quality impacts from combined LNG carrier traffic due to the complexity of modeling moving LNG carriers, changing topography along the river, and microclimates along the waterway. From a cumulative impact standpoint, operation of both the Oregon LNG and Bradwood Landing terminals would increase county emissions of NO_x and SO₂, primarily due to ship emissions as shown in table 4.12.7-1.

TABLE 4.12.7-1					
Estimated Operational LNG Project Emissions in Clatsop County, Oregon					
Facility	NO _x (tpy)	CO (tpy)	VOC (tpy)	SO ₂ (tpy)	PM ₁₀ (tpy)
Bradwood Landing Project	622.4	275.2	44.1	655.2	26.2
Oregon LNG Project	499	138	27.4	624.7	16.6
Total	1121.4	413.2	71.5	1,279.9	42.8
County Inventory	6,500 ^a	32,000 ^a	4,224 ^b	1,134 ^b	6,970 ^b
Increase in County Inventory (percent)	17.3	1.3	1.7	112.9	0.6
^a Provided by ODEQ.					
^b EPA, 2001.					

It should be noted that the inventory data we have for VOCs, SO₂, and PM₁₀ is not current; the newest data available for these pollutants is from 2001. Data for NO_x and CO inventories were obtained from the ODEQ and is more representative of current emission inventories. In addition, both Oregon LNG and Bradwood Landing would each have to obtain air quality permits from the ODEQ. Those permits would contain conditions and stipulations that may minimize cumulative impacts on air quality.

Because the other projects listed in table 4.12-1 are located over a large area; have varying construction schedules; and must adhere to federal, state, and local regulations for the protection of ambient air quality; it is impossible to quantitatively determine the incremental cumulative impacts that the Bradwood Landing Project would have in combination with these facilities and activities. As stated above, although Oregon LNG and Bradwood Landing may have large impacts on county emissions, it is unlikely that the addition of these facilities would have significant impacts on overall regional quality, although some degradation of overall air quality would be anticipated.

Noise impacts are particularly localized and attenuate quickly as the distance from the noise source increases. Therefore, cumulative impacts on noise associated with construction and operation of these projects would be unlikely.

4.12.8 Reliability and Safety

Impacts on reliability and public safety would be mitigated through the implementation of applicable federal, state, and local rules and regulations for each individual project. The specific rules and regulations that apply to each individual project would ensure that the applicable design standards are implemented to protect the public and to prevent accidents and failures. The LNG terminal facilities would be sited, designed, constructed, operated, and maintained in compliance with the federal safety standards summarized in table 2.8.1-1. The pipelines and aboveground facilities associated with the Bradwood Landing Project, Oregon LNG Project, and Palomar Pipeline would be designed, constructed, operated, and maintained in accordance with DOT Minimum Federal Safety Standards in 49 CFR 192.

4.12.9 Cumulative Impact Conclusions

We conclude that construction of the projects listed in table 4.12-1, especially if they are constructed on an overlapping timeline with the Bradwood Landing Project, has the potential to contribute cumulative impacts on the project area. The greatest potential for cumulative impacts is associated with the Oregon LNG Project. The type of project, construction methods, and impacts would be similar for the two projects. Each of these projects would result in temporary and minor effects during construction, but each project would be designed to avoid or minimize impacts on water quality, marine resources, and marine transportation. Additionally, significant impacts on sensitive resources resulting from these projects would be mitigated, and mitigation generally leads to the avoidance or minimization of cumulative impacts.

We recognize that unanticipated accidents during construction or operation could result in potential undefined impacts. However, a meaningful evaluation of those potential impacts is impossible, as quantification of potential impacts would be speculative at best. Accordingly, we consider project monitoring and mitigation programs to be critical in addressing unanticipated impacts, should they occur. With NorthernStar's proposed construction and operation methods, and strict adherence to our recommendations, federal and state regulations, and permitting requirements, impacts associated with the Bradwood Landing Project would be minimized, and would not constitute a significant impact in combination with other past, present, or reasonably foreseeable projects.

5.0 CONCLUSIONS AND RECOMMENDATIONS

5.1 SUMMARY OF THE STAFF'S ENVIRONMENTAL ANALYSIS

The conclusions presented are those of the environmental staff of the FERC working in cooperation with the Coast Guard and the COE. The Coast Guard LOR will address the suitability of the Columbia River for LNG marine traffic, and the Coast Guard's LNG Operations Plan will address issues related to the public impact of safety and security zones for LNG vessels. Likewise, the COE will present its own conclusions and recommendations in the dredging, dredged material placement, and wetland permits it may issue pursuant to section 10 of the RHA and section 404 of the CWA. The EPA has the authority to review and veto the COE decisions on the section 404 permit.

We (the Commission's staff) have determined that construction and operation of the Bradwood Landing Project would result in limited adverse environmental impacts. However, we have proposed measures to mitigate such impacts. We have also determined that the Bradwood Landing Project is unlikely to result in significant adverse environmental impact on particular resources within the Zones of Concern because it is unlikely that a substantial cargo release would occur. If the proposed project is found to be in the public interest and is constructed and operated in accordance with recommended mitigation measures, it would be an environmentally acceptable action. Our conclusion is based on information provided by NorthernStar; analyses and field investigations by Commission staff; literature research; alternatives analyses; comments from federal, state, and local agencies; and input from public groups and individual citizens. As part of our review, we developed measures that would appropriately and reasonably avoid, minimize, or mitigate environmental impacts resulting from construction and operation of the proposed project. As such, we recommend that our mitigation measures be attached as conditions to any authorization issued by the Commission.

If the Coast Guard issues an LOR finding the waterway suitable for LNG marine traffic, the arrival, transit, cargo transfer, and departure of LNG carriers would be required to adhere to the procedures of an *LNG Vessel Transit Management Plan* to be developed by the Coast Guard Sector Portland. In addition, NorthernStar would develop Operations and Emergency Manuals in consultation with the Coast Guard. These procedures would be developed to ensure the safety and security of all operations associated with LNG marine transits and unloading.

If an accidental or intentional breach of an LNG carrier resulting in a release of LNG were to occur during transit of the waterway, impacts on the various environmental resources within the Zones of Concern could result. LNG would not contaminate water, because it is not soluble, it floats, and the LNG would vaporize shortly after being spilled. The primary hazard from an LNG spill would be a pool fire if the vapors are ignited. A pool fire could have adverse effects on vegetation, wildlife, structures, and people. In general, the area of effect of an LNG release and any resulting fire would be fairly limited in area and short-lived. The severity and duration of the impacts would vary depending on the resource and its distance from the source, as resources in Zone 1 would be more severely impacted than resources in Zone 3. However, with implementation of the mitigation measures described in the Coast Guard's WSR, a release would be highly unlikely and the potential impact on resources would be less than significant.

5.1.1 Geology

The geology of the Pacific Northwest is dominated by the CSZ. The project area is located within the rotating block of that zone, including the Oregon Coast Range and Willapa Hills physiographic regions. The proposed Bradwood Landing LNG terminal was used by the COE to deposit materials dredged from the navigation channel of the Columbia River, and sand piles ranging from 10 to 15 feet

high are currently on site. Below the dredge material is alluvium, sands, silts and clays over basalt bedrock.

The proposed Bradwood Landing site has a high seismic risk associated with proximity to the CSZ. The site also is susceptible to soil liquefaction and lateral spreading at the design earthquake levels of shaking, and requires extensive ground improvements to make the site suitable for the LNG terminal. The project would be designed to withstand an earthquake of magnitude 9 on the CSZ, without loss of LNG containment. Measures to mitigate soil liquefaction impacts include supporting the LNG tanks and other integral structures on deep foundations and vibroflotation to compact existing soils and new fill. We are recommending that the final engineering design for the LNG terminal incorporate a number of detailed seismic specifications and other measures to mitigate the impacts of seismic hazards. The seismic hazard components of final engineering design would be reviewed and approved before construction of the LNG terminal. We are also recommending that prior to construction, NorthernStar retain the services of an independent Board of Consultants to provide oversight of the design and construction of all civil and structural components of the project with particular emphasis on the seismic design requirements and geological hazard mitigation measures for both the LNG terminal and sendout pipeline.

Landslide areas along the pipeline route would be mitigated by one or more of the following: relocation of the pipeline route; HDD crossing of the feature to place the pipeline below potential failure surfaces; and instrumentation of the pipe and/or the surrounding rock or soil to monitor strain in the pipe and movement of the surrounding ground. We are recommending that NorthernStar conduct additional studies and produce a Final Pipeline Design Geotechnical Report with site-specific mitigation measures prior to construction, which would be subject to review by the Board of Consultants and approval by the Director of OEP.

LNG marine traffic in the waterway, and construction and operation of the proposed LNG terminal and pipeline would not be adversely affected by other geological hazards. There is a low potential for tsunamis in this area, and the terminal would be raised to an elevation above the 100-year flood plain.

There is an inactive quarry within the parcel controlled by NorthernStar, outside of the portion that would be developed into the LNG terminal. Otherwise, the project would avoid impacting extractive mineral resources, with no active mines or quarries within 500 feet of the pipeline.

NorthernStar prepared a *Shoreline Monitoring Plan* for the LNG terminal to address shoreline erosion that may occur as a result of dredging for the maneuvering basin. We are recommending that NorthernStar prepare a similar plan to address potential shoreline erosion at the west end of Puget Island that may occur during operation of the project as a result of LNG marine traffic. Based on our review of NorthernStar's plan, as it relates to modification of critical fishery habitats, additional information will be included in the revised BA and EFH Assessment.

5.1.2 Soils and Sediments

The proposed LNG terminal is dominated by sandy soils. Soils along the proposed pipeline route are variable with surface textures ranging from gravelly and silt loams to loamy sands. About 8 percent of the soils that would be crossed by the proposed pipeline are classified as prime farmland, about 29 percent are hydric soils, and 38 percent are soils prone to compaction. Construction of the pipeline would not convert prime farmland to other uses, because it could still be used for agricultural purposes after the pipeline is installed and the right-of-way restored.

Potential impacts on soils would be minimized through measures specified in NorthernStar's terminal ESC Plan (for the LNG terminal) and pipeline ESC Plan and SWPPP (for the pipeline). However, our review of NorthernStar's plans found them to be too general, and we are recommending that NorthernStar revise its pipeline ESC Plan and SWPPP to include the measures from the FERC's Plan that provide greater protection.

NorthernStar's Environmental Site Assessment identified several potential RECs within the proposed LNG terminal property. Ten potentially contaminated sites were identified within 1,500 feet of the pipeline construction work areas. Given the potential presence of contamination at the terminal site and the possibility that contaminated soils could be encountered during installation of the pipeline, we are recommending that NorthernStar prepare a CMMP before construction.

The location for the construction worker parking lot has been changed from the original location proposed by NorthernStar and no information has been provided about the new site regarding soils or other resources. In addition, modifications are now being proposed to Bradwood Road and Clifton Road that would disturb areas outside the current footprint. Therefore, we are recommending that, prior to construction, NorthernStar submit additional information on resources that would be impacted during construction for the new proposed construction worker parking lot, Bradwood Road, and Clifton Road.

Construction of the LNG terminal would require the dredging of about 700,000 cubic yards of sediment for the ship berth and maneuvering area. NorthernStar proposes to place up to the entire 700,000 cubic yards of the dredged material on the LNG terminal site to raise the grade to an elevation of up to 25 feet NAVD 88. Any dredged material not placed at the terminal would be primarily used for beach nourishment at the Wahkiakum County Sand Pit site, located at the northern end of Puget Island. About 80,000 cubic yards of material would be removed from the ship berth and maneuvering area approximately every 2 to 4 years as part of maintenance dredging and placed at the Wahkiakum County Sand Pit site or another approved dredged material disposal site.

NorthernStar proposes to use hydraulic cutterhead dredging to excavate the proposed turning basin and berthing facilities. Dredging activities would resuspend sediments and result in increases in TSS and turbidity. However, the sediments are primarily sand and would settle quickly. As a result, the size of the sediment plume would be small and confined to an area immediately surrounding the proposed dredging site. We are recommending that NorthernStar prepare a plan to monitor the side slopes of the maneuvering basin after dredging and implement side slope protection measures to protect shallow water habitat if necessary.

River bottom samples were taken from the proposed maneuvering area, and analyzed for contamination by metals, inorganic compounds, and organic compounds. Trace amounts of some contaminants were found in the sediment samples, but none exceeded threshold levels that would be considered a threat to human health or would have an adverse effect on aquatic species.

5.1.3 Water Resources

NorthernStar proposes to install a water well at the terminal that would be used to produce a total of about 12.3 million gallons of non-potable water during the 3-year terminal construction period and about 1.1 million gallons annually during operation. Based on the anticipated pumping rates, the well's location, and the permeability of the soils, the drawdown from the well would be unlikely to have an effect on groundwater reserves, wetlands, Hunt Creek, or the Columbia River. NorthernStar has obtained a permit from ODWR to drill and operate this well.

NorthernStar has identified 20 registered private water wells along the pipeline route. Additional surveys and consultations with landowners would be conducted by NorthernStar to locate other wells in or near the proposed pipeline construction right-of-way where access was previously denied. NorthernStar developed a preliminary well protection plan to address the effects of HDD and pipeline trenching activities. In the event a water well is damaged as a result of the pipeline construction, NorthernStar would arrange for a temporary source of potable water and provide for the repair of the well or replacement of the water supply, as necessary. Additionally, NorthernStar would follow the measures outlined in its pipeline ESC Plan and SWPPP to avoid or minimize impacts on groundwater resources.

Dredging the maneuvering area would have limited temporary impacts on water quality in the Columbia River. NorthernStar proposes to place up to 700,000 cubic yards of dredged material on the LNG terminal site. Before dredged material placement, a perimeter berm would be constructed around the area receiving dredged materials, forming a basin into which the dredged material would be placed. NorthernStar indicated that the water settling out from the dredge material slurry placed at the proposed LNG terminal would mostly infiltrate into the ground and would not be allowed to overtop the perimeter berm and discharge to the river untreated. NorthernStar conducted hydraulic and sediment transport analyses that demonstrated that the proposed dredging would not significantly change river flows, bed conditions, or the form of Clifton Channel. However, the model showed that there may be minor changes in the bed elevation of the Columbia River near the navigation channel. We will further study project-related impacts on sediment transport and deposition within Clifton Channel and the lower Columbia River regarding biological function and value for aquatic resources. The results of our analyses will be included in our revised BA and EFH Assessment.

During construction, NorthernStar would appropriate about 15 million gallons of water from the Columbia River for soil compaction and ground improvements at the LNG terminal. This water would not be discharged to surface waters. NorthernStar would also obtain up to 60 million gallons of water from the Columbia River for hydrostatic testing of the LNG storage tanks. After use, the hydrostatic test water from the tanks would be discharged to the Columbia River through a temporary outfall extending approximately 300 feet offshore. About 8.9 million gallons of water would be withdrawn from the Columbia River for hydrostatic testing of the pipeline and would then be discharged to the ground surface. Additional surface water usage during operation of the LNG terminal would include approximately 13.7 million gallons per year for weekly fire suppression system testing, which would be discharged to the river. NorthernStar has obtained a permit from ODWR for these surface water appropriations.

No ballast water from LNG carriers would be discharged into the Columbia River during their transit to the terminal. However, once at dock each LNG carrier would take in up to an estimated 20 to 50 million gallons of water from the Columbia River for ballast and engine cooling during offloading operations. Water withdrawals during project construction and operation would not significantly affect the volume or flow of the Columbia River, as the typical flow of the river is about 45 million gpm and all permanent and temporary surface water intakes would be screened in accordance with the NMFS and ODFW requirements. We are recommending that NorthernStar conduct post-installation water flow mapping through all water intake screens at the LNG terminal, and provide the results of the flow mapping to the FERC, NMFS, and ODFW, for review and approval by the Director of OEP prior to operation of the screens. In addition, we are recommending that NorthernStar develop performance standards for water temperature and biocide use to minimize impacts on water quality associated with cooling water discharges from LNG carriers at the terminal. LNG carrier operations and any resulting impacts on water quality would be comparable to typical shipping traffic, and mitigated to a less than significant level through implementation of our recommendations.

During operation of the LNG terminal, the SCVs would generate about 160 gpm that would be discharged into the Columbia River under an NPDES permit following pH adjustment. While this SCV discharge water would be generally warmer than ambient water temperatures, it would not exceed the ODEQ's temperature standard of 68 °F for fish rearing and migration. The SCV water would be discharged using an outfall/diffuser system designed to rapidly mix the discharged condensate with river water.

NorthernStar proposes to replace the bridge over Hunt Creek as part of the improvement of Bradwood Road for upland access to the LNG terminal. While NorthernStar indicated it would implement specific measures and BMPs to avoid or reduce impacts on Hunt Creek, we are recommending that monitoring be conducted both upstream and downstream of the bridge during demolition and construction activities to ensure that water quality is not adversely affected.

The proposed 36.3-mile-long pipeline would cross 94 waterbodies, including 4 sensitive surface waters in Oregon and 9 sensitive surface waters in Washington. Sensitive surface waters include those containing federally listed threatened and endangered species or their designated critical habitat. The segment of the Columbia River that would be impacted by the proposed project is designated as EFH for coho and Chinook salmon, critical habitat for 12 salmonid ESUs or DPS, and as Aquatic Natural or Aquatic Conservation areas by Clatsop County. The LNG terminal site location is also included in the Lower Columbia River Estuary, which belongs to the EPA's National Estuary Program. At the terminal site, the Columbia River is listed on ODEQ's 303(d) water quality-limited list for temperature (year round, non-spawning) and for exceeding TMDL for arsenic, DDT, and PCBs year-round. NorthernStar would use the HDD construction method at each sensitive waterbody crossing to avoid impacts on waterbody banks and beds.

NorthernStar would use the HDD or conventional bore method at up to 23 waterbody crossings, thus eliminating the need for in-water construction activities that could result in sedimentation and turbidity as well as impacts on waterbody banks and beds. NorthernStar's HDD contingency plan provides procedures and measures to mitigate an inadvertent release of drilling mud to the waterbody. We are recommending that NorthernStar revise its HDD contingency plan to include mitigation measures for frac-outs in uplands. NorthernStar would use open-cut construction methods for the remainder of the waterbody crossings. To minimize impacts on surface waters, NorthernStar would implement its *Waterbody and Wetland Construction and Mitigation Procedures Plan*, in addition to implementing the protective measures specified in our Procedures and NorthernStar's pipeline ESC Plan and SWPPP. NorthernStar's *Waterbody and Wetland Construction and Mitigation Procedures Plan* has not been finalized. NorthernStar is consulting with the FWS, NMFS, and state agencies regarding specific mitigation measures that should be implemented to account for the potential loss of in-stream habitat within the waterbodies crossed by the pipeline. We are recommending that NorthernStar continue to consult with the appropriate federal and state agencies to develop a revised *Waterbody and Wetland Construction and Mitigation Procedures Plan* that includes a description of the specific methods of in-water habitat mitigation to be conducted, measures to prevent the spread of invasive species, and procedures for monitoring the success of revegetation and weed control efforts. With the implementation of the proposed measures and our recommendations, impacts on open-trenched waterbodies would be temporary, and suspended sediment and turbidity levels would return to preconstruction levels soon after the stream crossings are completed.

5.1.4 Wetlands and Terrestrial Vegetation

Construction of the LNG terminal would result in temporary impacts on about 15 acres of wetlands. About 13 acres of wetlands would be permanently lost by conversion of the land to industrial purposes for operation of the terminal. Construction of the pipeline would temporarily affect about 98

acres of wetlands. Operation of the proposed pipeline facilities would result in the permanent conversion of 15 acres of forested wetlands to other wetland types within the permanently maintained right-of-way. NorthernStar would mitigate temporary construction-related impacts by implementing its ESC Plans, SWPPP, and our Procedures, and by complying with the COE's section 404 permitting conditions and ODSL and WDE's section 401 permit conditions. After construction, any wetlands temporarily impacted would be restored back to their former use and function. Forested wetlands would be replanted with in-kind wetland tree specimens, except for a 10-foot-wide strip centered on the pipeline. Trees planted between 5 and 15 feet from the pipeline would be limited to a maximum height of 15 feet to allow for aerial inspection of the pipeline.

Although our Procedures specify that the construction right-of-way through wetlands should be limited to 75 feet, NorthernStar proposes to use a 100-foot-wide construction right-of-way when installing its pipeline across wetlands greater than 100-feet-long, and an 85-foot-wide construction right-of-way through wetlands less than that length. Given the saturated nature of the wetland soils, the need to separate spoil piles, and the larger trench size to accommodate concrete-coated pipe; the wider rights-of-way through wetlands are necessary to allow for safe construction of the pipeline with the least environmental damage.

We identified 24 areas where NorthernStar proposed to locate additional temporary extra workspaces within 50 feet of wetlands, which does not conform to our Procedures. In 21 cases where extra workspaces are needed for HDD or bores, we found the exception to our Procedures is justified, given the site-specific construction constraints. In three other situations, we are recommending that NorthernStar fence and avoid wetlands or relocate the extra workspace. We are recommending that NorthernStar fence wetlands at the pipe storage and contractor yard in Washington and that no work be performed within 50 feet of the wetland at this site.

NorthernStar has drafted a Compensatory Mitigation Plan to account for the permanent loss of some wetlands. Permanent impacts on wetlands would be mitigated by preserving or restoring a greater area of habitat with similar ecological function at different locations, including at the mouth of Hunt Creek, Svensen Island, and Delameter Creek. Because NorthernStar's Compensatory Mitigation Plan has not been finalized, we are recommending that NorthernStar continue to consult with the COE, NMFS, FWS, ODSL, WDE, and other appropriate agencies to finalize its Compensatory Mitigation Plan before project construction.

Construction of the proposed LNG terminal and related ancillary facilities, including the non-jurisdictional 1.5-mile-long power line, would affect about 31 acres of forest and 13 acres of scrub-shrub vegetation. About 10 acres of upland vegetation would be permanently converted to industrial use within the footprint of the operational LNG terminal facilities.

Construction of the proposed sendout pipeline would affect about 180 acres of forest and 7 acres of scrub-shrub vegetation. About 54 acres of forest and 3 acres of scrub-shrub vegetation would be within the permanent operational pipeline right-of-way. NorthernStar would restore and revegetate areas of upland vegetation that would be temporarily cleared during construction of the project.

Long-term impacts would occur on forested communities (i.e., coniferous, deciduous, mixed, early seral, and riparian forests) because of the time required to restore the woody vegetation to its preconstruction condition. NorthernStar would plant upland forested areas in-kind with trees, except for a 30-foot-wide strip centered on the pipeline, which would be planted with a native grass seed mix and maintained in an herbaceous state to facilitate maintenance and inspection. This would result in the conversion of currently forested communities within the permanent right-of-way to a grassland/herbaceous cover type. Annual clearing for maintenance of the pipeline in forested

communities would be limited to a 10-foot-wide corridor centered on the pipeline. NorthernStar's Compensatory Mitigation Plan describes the measures that would be implemented to compensate for impacts on both upland and wetland vegetation.

NorthernStar identified several species of noxious weeds occurring in the project area, including Scotch broom, Himalayan blackberry, and reed canary-grass. To prevent and mitigate for the distribution of noxious weeds during construction and control noxious weeds that develop after construction, we are recommending that NorthernStar revise its *Noxious Weeds and Soil-borne Plant Disease Control Plan* based on consultations with appropriate resource agencies.

5.1.5 Wildlife and Aquatic Resources

The impact of the proposed project on terrestrial wildlife would vary depending on the timing of construction, techniques used, types of habitat affected, and the behavior of individual species. In general, impacts on terrestrial wildlife would be short term because much of the area affected by construction would be restored back to its previous habitat type. Typically, mobile species would relocate to similar adjacent habitat during construction, and return after the area is restored.

Operational lighting at the LNG terminal could affect both terrestrial wildlife and aquatic species. We are recommending that NorthernStar continue to consult with the NMFS, FWS, ODFW, and other appropriate agencies regarding its Lighting Plan and that it be filed for review and approval by the Director of OEP prior to operation of the LNG terminal.

Blasting may occur during construction of the LNG terminal at a quarry near the southwest corner of the site approximately 800 feet from the Columbia River. Special blasting techniques and cover material are typically used to control blasting noise. We are recommending that NorthernStar consult with the NMFS, FWS, ODFW, and other appropriate agencies in developing its Blasting Management Plan to minimize potential impacts on sensitive wildlife sites and species during blasting activities.

Marine mammals and sea turtles may use the lower Columbia River and Pacific Ocean near the Oregon coast overlapped by the waterway for LNG marine traffic. The potential for LNG carrier strikes on marine mammals and sea turtles in the waterway during transit to and from the proposed LNG terminal is low, given the speed of the LNG carriers and historic records indicating that vessel strikes of marine animals rarely occur in the lower Columbia River.

LNG carriers transiting the lower Columbia River over the operational life of the LNG terminal are likely to result in the stranding of some sub-yearling fish. In addition, the LNG carriers could increase shoreline erosion, which may have associated adverse impacts on aquatic resources, including salmonids. We are recommending that NorthernStar consult with the NMFS and conduct additional studies of impacts on juvenile fish from wake stranding and shoreline erosion due to LNG carrier traffic in the waterway. Further analysis of these issues will be contained in the revised BA and EFH Assessment.

Dredging the maneuvering area and pile driving during construction of the marine berth at the terminal could have impacts on pinnipeds. Therefore, we are recommending that NorthernStar develop, before construction begins, more protective measures (including safety, buffer, and noise impact zones) to avoid or minimize impacts on pinnipeds. To address the potential for impacts on marine mammals from noise and other construction related activities during the driving of piles for the terminal berth, NorthernStar would apply for an Incidental Harassment Authorization from the NMFS under the MMPA section 101(a)(5)(D).

At the terminal wharf, NorthernStar proposes a system capable of delivering filtered river water to the LNG carriers, and the recirculation of engine cooling water to be reused for ballast. This system would use a screened water intake located at the ship berth that would minimize the entrainment and impingement of juvenile fish. Since issuance of the draft EIS, NorthernStar has stated that LNG carriers may arrive at the terminal without the necessary retrofitting in place to allow the use of the screened water intake system. To minimize impacts on aquatic resources, we are recommending that NorthernStar require that LNG carriers are retrofitted, as recommended in the draft EIS, or develop an alternative system for non-retrofitted carriers that would offer similar protection. The screened water supply system would be further analyzed during consultation with NMFS and we are recommending that the final design plans be approved by the Director of OEP prior to initial site preparation at the LNG terminal.

We identified EFH for groundfish, coastal pelagic species, Pacific Coast salmon, and highly migratory species within the project area. Species with EFH designated in the vicinity of the proposed project could potentially be impacted by dredging, pile driving, and in-water activities associated with both construction and operation of the LNG terminal, and construction of the pipeline. Although there would be permanent impacts on EFH as a result of project construction and operation, mitigation for impacts on EFH would be included in the Compensatory Mitigation Plan, as discussed below. We consolidated EFH consultations for the Bradwood Landing Project with the consultations required under the ESA. The FERC staff is currently revising the BA and EFH Assessment. Upon completion, the BA and EFH Assessment will be resubmitted to the agencies with a request to initiate consultation. After reviewing the EFH Assessment, the NMFS will provide recommendations regarding further measures that can be taken to conserve EFH. The FERC will respond to any EFH Conservation Recommendations issued by the NMFS through the EFH/ESA consultation process.

Hydrodynamic and sediment transport modeling for the dredging of the maneuvering area showed that the combined background and project-related suspended sediment concentrations would be well below the lethal level for fish. In addition, sediment sampling and analysis did not detect any elevated contaminant concentrations within the proposed dredged materials and leave surface that could adversely affect aquatic species. Therefore, impacts on aquatic species from increased TSS and associated turbidity would be temporary and minor. Dredging would remove the current benthic population of organisms within the sediments, including prey species such as sand shrimp, daphnia, and copepods. Rates of recovery for these species may range from several months to as much as 2 to 3 years depending on substrate type and currents in the affected area.

Before and during dredged material placement, including filling of the former mill log pond at the LNG terminal, NorthernStar would capture and remove fish from the log pond to minimize risk of injury to fish. To minimize re-entry of individuals into the log pond, we are recommending that NorthernStar place nets at the outlet of the log pond during collection efforts that only allow emigration from the pond.

Tubular steel piles would be installed as part of the marine berth at the proposed LNG terminal. Driving steel piles can generate intense underwater sound pressure waves that can affect nearby marine organisms. To minimize impacts on aquatic species as a result of pile driving, NorthernStar would observe the in-water work window for the Columbia River and would use fewer, large-diameter, vertical piles, vibratory pile driving as conditions allow, and pile caps. In addition, we are recommending that NorthernStar develop a revised Bubble Curtain Contingency Plan in consultation with the appropriate resource agencies prior to construction.

Waterbodies affected by construction and operation of project facilities provide habitat for spawning, breeding, feeding, growth, and shelter to numerous species of fish and fish prey. The proposed pipeline route would impact 94 waterbodies; however, in-water activities would be avoided in the most sensitive waterbodies by the use of the HDD or conventional bore construction methods. Impacts on

streams crossed using typical open-cut pipeline construction methods would be temporary, and should have no long-term effects on water temperature, pH, dissolved oxygen, benthic invertebrate populations, or fish populations. To reduce sedimentation and erosion that may affect waterbodies crossed by the pipeline, NorthernStar would implement its *Waterbody and Wetland Construction and Mitigation Procedures Plan*, pipeline ESC Plan for Oregon, and its SWPPP for Washington as well as our Procedures.

During construction and operation of the proposed pipeline, habitat modification, increased noise and lighting, and vegetative clearing could adversely affect migratory birds occurring along the pipeline route. In order to minimize potential impacts, NorthernStar would clear the pipeline route between August 1 and April 15 to avoid the peak nesting season. However, due to the importance of the area for migratory birds, we are recommending that NorthernStar consult with the FWS and other appropriate agencies to develop a Migratory Bird Nest Avoidance Plan to minimize impacts on migratory birds during the peak nesting season.

Following construction of the LNG terminal and pipeline, habitat and ecosystem function would be restored in place. Permanent impacts on aquatic resources would be mitigated by restoring habitat with similar ecological function. As part of its Compensatory Mitigation Plan, NorthernStar proposes to preserve or restore habitat in areas substantially larger than that lost to permanent impacts, and to a higher level of ecosystem function at Svensen Island, Peterson Point, Hunt Creek, and Delameter Creek. We are recommending that NorthernStar continue to consult with appropriate resource agencies to finalize its Compensatory Mitigation Plan. NorthernStar has voluntarily developed an SEI that would contribute about \$59 million over the life of the project (i.e., 40 years) to fund measures for the recovery of salmon and the lower Columbia River ecosystem. The SEI would be above and beyond the activities outlined in the Compensatory Mitigation Plan.

5.1.6 Federally-listed Threatened and Endangered Species

Informal consultations with the FWS and NMFS identified 37 federally listed endangered or threatened species that potentially occur in the vicinity of the Bradwood Landing Project, including the waterway for LNG marine traffic. The federal list includes 13 anadromous salmonids and the North American green sturgeon. Of these, critical habitat has been designated for 12 salmonid species. There are also four reptiles (sea turtles), nine mammals (including seven whales; Steller sea lion; and Columbian white-tailed deer), six birds, one invertebrate, and three plants that are federally listed that may occur in the project area.

We submitted our BA and EFH Assessment to the FWS and NMFS in March 2007. The FWS and NMFS requested additional data; therefore, the FERC staff is currently revising its BA and EFH Assessment for the Bradwood Landing Project.

To address issues raised by the FWS, we are recommending that prior to construction, NorthernStar should conduct additional surveys to identify any federally listed plant species or bald eagles at the proposed LNG terminal or along the sendout pipeline route and restrict pipeline construction activities within potential Columbian white-tailed deer habitat between June 1 and July 15. We are also recommending that NorthernStar coordinate with the NMFS to determine appropriate LNG carrier speed, seasonal restrictions, or other applicable measures to avoid or minimize impacts on whales, wake stranding of juvenile fish, and shoreline erosion. We are also recommending that NorthernStar expand the protective measures to avoid or minimize impacts on Steller sea lions to include all pinnipeds. The results of these additional consultations and analyses will be incorporated into our revised BA and EFH Assessment.

Based on NorthernStar's proposed construction and mitigation measures and our recommendations and consultations to date, we conclude that the project would have no effect on the following species and/or designated critical habitat:

- Columbia River bull trout DPS (and its designated critical habitat);
- designated critical habitat for the green sea turtle;
- designated critical habitat for the leatherback sea turtle;
- Oregon spotted frog;
- designated critical habitat for the southern resident killer whale;
- designated critical habitat for the Steller sea lion;
- designated critical habitat for the northern spotted owl;
- short-tailed albatross;
- western snowy plover;
- yellow-billed cuckoo;
- Oregon silverspot butterfly (and its designated critical habitat); and
- proposed critical habitat for Kincaid's lupine.

We conclude that the project may affect, but is not likely to adversely affect, the following species and/or designated critical habitat:

- steelhead:
 - designated critical habitat for the Middle Columbia River DPS;
 - designated critical habitat for the Upper Columbia River DPS;
 - designated critical habitat for the Upper Willamette River DPS;
 - designated critical habitat for the Snake River Basin DPS;
- green sea turtle;
- leatherback sea turtle;
- loggerhead sea turtle;
- olive ridley sea turtle;
- blue whale;
- humpback whale;
- North Pacific right whale;
- sei whale;
- Southern Resident killer whale;
- sperm whale;
- brown pelican;
- designated critical habitat for the marbled murrelet;
- northern spotted owl;
- streaked horned lark;
- designated critical habitat for the western snowy plover;
- Kincaid's lupine;
- Nelson's checker-mallow; and
- water howellia.

We conclude that the project is likely to adversely affect the following species and/or designated critical habitat:

- Chinook salmon:
 - Lower Columbia River ESU (and its designated critical habitat)

- Upper Columbia River Spring-run ESU (and its designated critical habitat)
- Upper Willamette River ESU (and its designated critical habitat)
- Snake River Spring/Summer-run ESU (and its designated critical habitat);
- Snake River Fall-run Chinook salmon ESU (and its designated critical habitat);
- Columbia River chum salmon ESU (and its designated critical habitat);
- Lower Columbia River coho salmon ESU;
- Snake River sockeye salmon ESU (and its designated critical habitat);
- steelhead:
 - Lower Columbia River DPS (and its designated critical habitat);
 - Middle Columbia River DPS;
 - Upper Columbia River DPS;
 - Upper Willamette River DPS;
 - Snake River Basin DPS;
- North American green sturgeon;
- fin whale;
- Steller sea lion;
- Columbian white-tailed deer; and
- marbled murrelet

We are recommending that construction should not be allowed until after the FERC completes formal consultations under the ESA and NorthernStar completes consultation under the MMPA.

5.1.7 Land Use, Recreation, and Visual Resources

The area along the shore of the waterway for LNG marine traffic is mostly rural, with forest being the main land use. There are a number of houses and commercial buildings within the communities along the waterway overlapped by the Zones of Concern for LNG marine traffic. The urban areas along the waterway with the highest populations include the cities of Astoria with about 9,800 people, Warrenton with about 4,100 people, and Cathlamet with about 600 people. Puget Island has a dispersed rural population of about 800 people. All the other communities overlapped by the Zones of Concern along the waterway have populations of less than 500 people each. On the western end of Puget Island, the Zones of Concern overlap at least 74 structures. In addition, the Zones of Concern overlap the LCNWR, JBHNWR, elements of the LCNHP, some state and local parks, and other recreation and public interest areas along the waterway for LNG marine traffic.

The Bradwood Landing Project could have minor impacts on commercial fishing and recreational users of the Columbia River. The Zones of Concern along the waterway used by LNG marine traffic would overlap marinas in Hammond, Warrenton, Astoria, and Cathlamet. Boaters and fishermen may have to briefly move out of the way of LNG marine traffic heading upriver to the LNG terminal, as the Coast Guard would impose a moving 500-yard safety and security zone around LNG carriers transiting up the waterway. This zone would be an area over which the Coast Guard would have authority and is not meant to be an exclusion zone. Jet-skiers, wind-surfers, kite-surfers, kayakers, and canoers typically stay in shallow water outside of the navigation channel. The effects of wakes from LNG carriers on small craft would be no different than the effects from wakes from large vessels currently using the lower Columbia River. About 19 cruise ships per year dock at Astoria Pier 1, which is overlapped by Zone 1. The Coast Guard's WSR has specific conditions to protect these cruise ships while at berth, or in meeting situations with an LNG carrier transiting up the Columbia River.

LNG marine traffic may also have visual impacts for people residing in the shoreline communities, traveling along highways adjacent to the waterway, using the parks and public interest areas

within the Zones of Concern, or other river users. Visual impacts would be short term, as it would typically take an LNG carrier only a few minutes to pass through a viewshed while traveling at average speeds between 8 and 12 knots. In addition, viewers are accustomed to seeing up to 2,000 other commercial ships per year move up and down the Columbia River.

Under normal operations, LNG carriers transiting the waterway would have no significant impacts on current land uses, recreation, or visual resources. Because of its physical properties, released LNG would disperse in the atmosphere or, if ignited, burn in a pool fire. Impacts from a marine release of LNG with ignition would depend on the location of the incident within the waterway and the scope of the incident. Damage to shoreline structures and vegetation along the waterway resulting from a pool fire would range from mild to severe, with the greatest impacts occurring within Zone 1 and decreasing outward through Zones 2 and 3. However, due to the safety and security measures described in the Coast Guard's WSR, the likelihood of an LNG spill is extremely remote.

The proposed LNG terminal would be located within a 411-acre parcel that is privately held but controlled by NorthernStar through a purchase option. This tract was the site of several historic lumber mills that operated between about 1843 and 1852, 1910 and 1920, and 1930 and 1962, and the townsite of Bradwood, that was founded around 1930 and abandoned by 1985. Between 1966 and 2002, the COE deposited almost 900,000 cubic yards of dredged material at Bradwood Landing from maintenance of the navigation channel.

The proposed ship berth and maneuvering area for the LNG terminal would cover about 58 acres of open water within the Columbia River. Construction of the onshore portion of the terminal, including the proposed power line would disturb about 65 acres total, of which about 21 acres is dredged sand piles, 26 acres is forest, 13 acres is scrub-shrub vegetation, and 5 acres is developed former industrial areas. About 40 acres would be permanently converted to industrial use for operation of the facilities. The remainder of the parcel controlled by NorthernStar would be retained in its current land use. However, NorthernStar proposes to improve wetland habitat at the mouth of Hunt Creek.

There are no residences closer than 0.6 mile from the proposed LNG terminal, but 21 residences are located between 0.6 and 1.0 mile away, all on the western tip of Puget Island, in Wahkiakum County, Washington. Temporary construction impacts on nearby residents could include inconveniences caused by noise generated during dredging of the maneuvering area and pile driving for the marine berth, as well as dust. Potential operational impacts on residences in the vicinity of the terminal include lighting, noise, and visual impacts. Noise and dust impacts are discussed further below.

NorthernStar produced computer-generated simulations to assess visual impacts from viewpoints on Tenasillahe Island within the JBNWR, Cathlamet, and Skamokawa. The most visible part of the LNG terminal would be the storage tanks, which would be about 170 feet high. Visual impacts of the LNG facility would be minor because views would be screened by landscape, vegetation, and distance. The facilities would be painted to blend into the backdrop of the hills to the south of the terminal site. An earthen berm enclosing the LNG onshore facilities and landscaping along the shoreline would provide an additional visual barrier between the river and the terminal.

Construction and operation of the LNG terminal and sendout pipeline would not directly impact any national, state, or local parks, developed recreational facilities, or public interest areas. For about 8.0 miles, the Bradwood Landing natural gas sendout pipeline would be adjacent to the existing KB pipeline, while the remainder of the route would be on newly created right-of-way. The pipeline would have limited visual impacts, because it would be buried underground. Only the clearing of forest along the pipeline route would have long-term visual impacts, as discussed above.

Construction of the pipeline, inferred laterals, and associated aboveground facilities would disturb about 309 acres of forest, 89 acres of agricultural land, and about 59 acres of rangeland. Other land uses crossed by the pipeline route include residential areas, commercial/industrial areas, open land, and water. About 232 acres would be retained as part of the permanent 50-foot-wide operational right-of-way. Except for a 10-foot-wide corridor centered on the pipeline that could be mowed annually and maintained in a grassy/herbaceous state, the temporary construction right-of-way would be returned to its previous condition and use.

NorthernStar has identified three residences within 50 feet of proposed construction work areas for the pipeline. No residences are located within 50 feet of the associated aboveground facilities. NorthernStar filed its *Residential Construction Conceptual Mitigation Plan* that outlines the general measures that NorthernStar would implement to minimize construction related impacts on residences and other structures located within 50 feet of the proposed pipeline construction right-of-way. NorthernStar recognized that it did not yet have access to some properties along the pipeline route, and so it could not develop detailed site-specific residential construction mitigation plans for all residences within 50 feet of the construction right-of-way. Therefore, we are recommending measures that NorthernStar should implement during construction to reduce impacts on residences within 50 feet of the construction work area, and file a final residential mitigation plan before pipeline construction begins.

We did not identify any future planned residential or commercial developments in close proximity to the proposed pipeline route in Clatsop County Oregon. Cowlitz County, Washington indicated that a building permit application has been submitted to the county for a proposed single family dwelling located adjacent to the Bradwood Landing pipeline route. Therefore, we are recommending that NorthernStar study Cowlitz County records to determine all plans for future residential and commercial developments along the proposed pipeline route in Washington, and provide details about how NorthernStar would avoid or mitigate impacts on that future residence.

Columbia County has identified several development projects at the Port Westward Industrial Area and the Port of St. Helens, as well as its intended expansion of Hermo Road. Therefore, we are recommending that NorthernStar document that it has consulted with the Port of St. Helens, the Columbia County Development Agency, and other appropriate agencies and representatives of Columbia County, to determine if its pipeline may have impacts on county improvements in the vicinity of the Port Westward Industrial Area.

In February 2007, NorthernStar submitted a comprehensive application for permits and land use approvals to Clatsop County, Oregon. Following information requests and a number of public hearings, the Clatsop County Board of Commissioners made a final decision in March 2008 approving NorthernStar's proposed zoning changes, subject to a series of conditions. The LNG terminal and pipeline are now accepted uses in Clatsop County, consistent with local zoning and state planning guidelines.

The pipeline route in Columbia County, Oregon, would cross lands zoned as agricultural (PA-38), industrial (RIPD), and residential (RR-5). While installation of a natural gas pipeline would be an allowed use across PA-38 and RIPD zoned lands in Columbia County, it would normally not be allowed across RR-5 zone lands without a zoning change or amendment to the county ordinances. However, the Planning Director for Columbia County has acknowledged that the local permitting process is preempted by the FERC's authority to site pipelines under the NGA.

The pipeline would cross unzoned lands in Cowlitz County, Washington. The county may review the environmental impacts of the proposed pipeline under county and state regulations, including the SEPA, Shoreline Management Act, Cowlitz County's Critical Areas Ordinance, its Gas and Oil Pipeline

Ordinance, and its Comprehensive Plan. Cowlitz County is the lead agency for SEPA, and may adopt this EIS as part of its environmental review process.

NorthernStar submitted a revised consistency certification on October 23, 2007. On November 21, 2007, ODLCD determined that its 6-month review period began with the submission of the revised consistency certification. On April 10, 2008, the ODLCD and NorthernStar executed a Stay Agreement that allowed for a 150-day continuation period, during which NorthernStar could provide additional information to supplement its application with the ODLCD. We are recommending that NorthernStar file documentation that its project is consistent with the CZMA before we allow any construction to begin.

5.1.8 Socioeconomics

The population within the Zones of Concern along the waterway for LNG traffic could be affected by an accidental or intentional breach of an LNG carrier resulting in a release of LNG and a pool fire if the vapors are ignited. The degree of impact from an LNG release and related pool fire would depend on the location and extent of the incident, with effects being most severe in Zone 1 and decreasing outward through Zones 2 and 3. However, with the implementation of the safety and security measures and conditions outlined in the Coast Guard's WSR, an LNG release along the waterway would be highly unlikely and impacts on populations would be less than significant.

No appreciable changes to the local population are expected to occur as a result of the proposed project. NorthernStar estimates that an average of 331 workers would be employed during the 3-year terminal construction period, with a peak workforce of 506 occurring between months 20 and 26. Approximately 75 percent of the construction workforce is expected to commute from the Portland MSA (5 percent of this total would reside in Columbia County, Oregon). Others are expected to commute from Clatsop County, Oregon (15 percent) and Wahkiakum and Cowlitz Counties, Washington (10 percent). In addition, 313 workers are expected to be employed during peak construction of the pipeline, occurring during month 13. Approximately 86 percent of the construction workforce for the pipeline is expected to commute from the Portland MSA (with 6 percent residing in Columbia County), while the remainder of workers would probably commute from Cowlitz, Clatsop, and Wahkiakum Counties.

We estimate that about 20 specialty workers or managers may temporarily relocate to the area during project construction. The non-local workers and their families that may relocate to the area would be easily absorbed into the regional communities and would not present a strain on local housing or public services. There are currently about 2.2 million people in the Portland MSA, plus Clatsop County, Oregon, and Cowlitz and Wahkiakum Counties, Washington. This area has over 5,000 vacant housing units available, plus 2,000 temporary camp sites at RV parks and campgrounds.

NorthernStar expects to hire and train local residents to operate the LNG terminal. Based on the current commuting patterns at the nearby Georgia-Pacific paper mill at Wauna, it is expected that nearly all these workers would come from the four-county area. Therefore, operation of the project would have no significant impacts on regional population or housing.

The project should not have any significant impacts relating to environmental justice. The waterway for LNG marine traffic, LNG terminal, and sendout pipeline would not be located in communities with disproportionately high percentages of minorities, Native Americans, or low income populations. The project should not adversely affect property values. Studies of areas surrounding existing LNG peak shaving plants have not found any negative impacts on property values, and other independent research found that the presence of a pipeline on a tract of property had little influence on its sale price.

The project would have positive effects on local employment and the regional economy. Total construction costs for the project are estimated to be \$726 million. NorthernStar estimates that total payroll (which includes both wages and benefits) for the construction of the project would be \$110 million. Within the four-county area, NorthernStar estimates that total direct expenditures on goods, equipment, and services during construction of the project would be \$87.9 million. NorthernStar estimates that total indirect and induced effect on the regional economy as a result of construction of the project would be an influx of about \$77 million.

Operation of the Bradwood Landing Project would result in about 65 new permanent positions at the LNG terminal, with a total payroll of about \$3.9 million per year. NorthernStar calculated that operation of the project would generate a total of about \$20.4 million per year in direct and indirect economic benefits to the four-county study area, including payroll and expenditures. NorthernStar would pay about \$7.8 million in annual property taxes to Clatsop County during operation of the terminal. Based on the portion of the pipeline in each of the counties and tax rates from the different taxing entities, property taxes for the pipeline would be paid as follows: approximately \$284,029 to Clatsop County, \$518,465 to Columbia County, and \$740,250 to Cowlitz County.

About 91 existing roads would be crossed by the pipeline. No new roads would be needed for access during construction of the pipeline. Construction of the Bradwood Landing Project could affect transportation and traffic in the project area by increasing the number of vehicle trips per day on area roads as a result of commuting workers and construction equipment, temporarily closing some roads that are crossed during pipeline construction, and the possible modification of access roads to accommodate large construction equipment and vehicles. These increased traffic levels associated with construction of the LNG terminal and pipeline would be temporary and limited to the period of construction (about 3 years at the LNG terminal site and about 16 months along the pipeline route). NorthernStar would reduce worker commuter traffic by creating a parking lot near Taylorville and busing workers to their job sites. Clifton Road would be widened to 28 feet, resulting in two 12-foot travel lanes with a 2-foot shoulder on each side of the road. An east-bound turning lane and a west-bound deceleration lane would be installed on Highway 30 at the intersection of Clifton Road. We are recommending that NorthernStar file its final traffic management plan for review and approval prior to construction. In finalizing the traffic management plan, we are recommending that NorthernStar consult with the appropriate agencies regarding measures to minimize impacts on narrow roads that would be used to access the construction right-of-way.

NorthernStar, PWRR, and ODOT are negotiating an agreement to allow the relocation of the railroad through the terminal tract. We are recommending that NorthernStar file a copy of the final Railroad Relocation Agreement prior to construction.

Operation of the LNG terminal could affect other ships using the waterway. Approximately 125 LNG carriers per year would travel up the Columbia River to deliver cargo to the LNG terminal, resulting in about a 7 percent increase in commercial ship traffic. As described in the WSR, the Coast Guard would enforce measures that would affect other ships using the lower Columbia River navigation channel, including establishment of a 500-yard moving safety and security zone around an LNG vessel while it is underway to the LNG terminal. Although one-way traffic would be imposed along certain portions of the waterway during the LNG carrier transit, four passing zones along the transit route would allow two-way traffic. Through careful traffic management, prearrangement of meeting locations, and an expanded vessel information system, ship traffic delays are expected to be negligible.

A marginal increase in ship traffic could occasionally increase the wait time for ships in Astoria. If a large number of ships arrive at the mouth of the Columbia River in a short time period, some may need to wait for a pilot. A similar scenario plays out just upriver of Astoria when bar and river pilots

replace one another. The worst case delay scenario is that another ship would be required to wait an entire tide cycle (12 hours or more). Because the river currently supports a high level of cargo shipping, it is anticipated that other vessels have extensive experience with ship traffic and would be adept at minimizing wait time. NorthernStar has filed a proposal for navigation protocols and priorities that would minimize delays to other commercial vessels on the lower Columbia River due to LNG carrier traffic.

The proposed project should not adversely affect businesses related to tourism. The Coast Guard's WSR has special conditions to protect cruise ships. There are 12 hotels in Astoria and 2 bed-and-breakfast type accommodations on the western end of Puget Island that would be overlapped by Zones 1 and 2 along the waterway for LNG marine traffic. However, with the safety and security measures to be implemented by NorthernStar, and the conditions outlined in the Coast Guard's WSR, the likelihood of an LNG carrier incident that may affect commercial businesses, hotels, or tourists along the waterway is extremely remote.

5.1.9 Cultural Resources

We considered whether project-related LNG marine traffic would have the potential to adversely affect historic properties. It is highly unlikely that an LNG carrier transiting in the waterway could have any impacts on the 37 known shipwrecks along the Pacific Coast and Columbia River in Oregon within the Zones of Concern, because those resources are located outside of the navigation channel, and even if an LNG carrier lost steerage it would run aground before coming near to those shipwrecks. We identified a number of historic properties along the shoreline of the waterway, including individual sites at Fort Stevens State Park, Warrenton, Astoria, Altoona, and Cathlamet, and NRHP districts at Cape Disappointment State Park, Skamokawa, and Astoria. However, with the implementation of NorthernStar's proposed safety and security measures and the conditions outlined in the Coast Guard WSR, the likelihood of an incident involving an LNG carrier along the waterway is extremely remote and potential impacts on historical properties would be less than significant.

NorthernStar's cultural resource consultant identified the LCNHT as a resource that may be potentially eligible for the NRHP. Although the LCNHT follows the lower Columbia River along the route of the 1804-1805 Lewis and Clark expedition, no Lewis and Clark campsites have been recorded in the project area, nor has the LCNHT been documented in this region. We and the Oregon SHPO agree the project would have no adverse effects on the LCNHT.

NorthernStar had a cultural resources consultant survey about 28 acres within its proposed LNG terminal parcel. That survey recorded two historic archaeological sites: the remains of the town of Bradwood and its associated lumber mill (35CLT88), and the ACRR (now operated as the PWRR). We and the Oregon SHPO concur that the project would have no adverse effects on the ACRR/PWRR. However, the SHPO requested that the evaluation of site 35CLT88 be better justified, and wanted additional information provided about the unrecorded historic Hunt lumber mill whose remains may exist within the property controlled by NorthernStar, but outside of the LNG terminal construction area.

Additional surveys were conducted of facilities associated with the LNG terminal. About 82 acres were inspected along the proposed route for the power line to the terminal, alternative routes, and access roads, that resulted in the recording of seven isolated finds and one historic archaeological site (remains of an abandoned segment of old Highway 30). All of those resources were evaluated as not eligible for the NRHP.

About 25 miles along the route of the proposed natural gas sendout pipeline have been inventoried. No new cultural resources were identified. The unrecorded Abernathy Cemetery near Oak

Point and previously recorded prehistoric archaeological site 35CO16 at Port Westward should be avoided by NorthernStar's proposed HDD under the Columbia River between MPs 19.0 and 19.7. The Oregon SHPO has requested additional information about the HDD relative to site 35CO16. The Washington SHPO has requested a schedule for future surveys and plan for future actions.

We have not yet completed the process of complying with section 106 of the NHPA. Cultural resources surveys are needed for about 11 miles total of the pipeline route after access is obtained. In addition, NorthernStar needs to conduct additional investigations and revise its reports to address comments from the SHPOs and the FERC staff. Once cultural resources surveys and evaluations are complete, the FERC, in consultation with the cooperating agencies and the Oregon and Washington SHPOs, would make determinations of NRHP eligibility and project effects. If any historic properties would be affected by the proposed project, we would seek ways to resolve adverse effects. We are recommending that construction be deferred until after these surveys are completed; NorthernStar files required reports and plans, including treatment plans for any historic properties that would be adversely affected; the SHPOs' comments on the reports and plans are filed; the ACHP has had an opportunity to comment; the FERC staff has reviewed and approved all reports and plans; and the Director of OEP issues a letter stating that treatment measures should be implemented or construction may proceed.

We have fulfilled our obligations to address compliance with the Native American Religious Freedom Act, section 101(d)(6) of the NHPA, and 36 CFR 800.2(c)(2). Through our NOI, we contacted Indian tribes that may have historically occupied or used the project area and might attach religious or cultural significance to historic properties in the APE. At their request, the FERC staff met independently with the CRITFC, including representatives of the Nez Perce Tribal Council, and with the Warm Springs Tribal Council. In addition, the FERC provided copies of the draft EIS to Indian tribes and other Native American organizations listed in Appendix A. No traditional cultural properties, religious, cultural, or sacred sites which may be affected by the project were identified by any tribes, NorthernStar's cultural resources consultants, or by the SHPOs. NorthernStar documented consultations with Indian tribes and appropriate Native American groups that might have an interest in the project. We are recommending that NorthernStar file documentation of continued consultation with Indian tribes, including correspondence and providing copies of revised reports of cultural resources investigations.

5.1.10 Air Quality and Noise

Construction of the proposed LNG terminal and pipeline would have temporary adverse impacts on air quality due to gasoline and diesel combustion emissions, primarily NO_x and CO, associated with operating construction equipment and vehicles as well as fugitive dust emissions. NorthernStar proposes to use the following measures to reduce emissions from construction equipment and commuter vehicles: limit truck idling as much as possible, properly maintain construction equipment in accordance with manufacturers' specifications or standard practices, encourage construction workers to carpool to the construction site, use BMPs to minimize dust, and implement a shuttle service to and from retail services and food establishments during lunch hours or provide lunch services at the site.

Operation of the LNG terminal would result in air emissions from: stationary equipment (SCVs and emergency engines), LNG carriers, security vessels, and tugs. Because the emissions from the marine vessel traffic would be periodic and transient, they are not expected to result in significant long-term air quality impacts, although there could be short-term localized impacts.

NorthernStar submitted an application to the ODEQ for an air quality permit in early 2006 and a revised application in March 2007. NorthernStar modeled the impacts associated with operational emissions from stationary sources as well as emissions from LNG carriers using site-specific meteorological data. The results were provided to the ODEQ along with the March 2007 air quality

permit application. The modeling estimates show that operational impacts on air quality would be below the NAAQS.

NorthernStar would minimize air emissions from the proposed stationary sources through the use of clean fuel (natural gas and low sulfur diesel oil), the employment of BMPs for operation and maintenance procedures, and limiting annual hours of operation from the diesel-fired units.

Operational emissions from the proposed pipeline would be limited to blowdown emissions that would occur during emergency situations and fugitive emissions during operation. Blowdowns would rarely occur and fugitive emissions would be negligible due to the small amount of natural gas emitted and the small fraction of VOCs contained in the natural gas. Therefore, these emissions would not have a significant effect on air quality.

Noise would be generated during construction of the pipeline and during construction and operation of the LNG terminal. In most areas, the increase in noise during construction would be localized, temporary, and limited primarily to daylight hours. However, noise associated with dredging operations could occur up to 24 hours per day, 7 days per week for a period of approximately 48 to 72 days. Increases in noise levels during construction of the sendout pipeline would be limited to areas close to the construction activity. The most prevalent construction noise in and around the project area would be engine-driven construction equipment.

During operation of the project, the intermittent operation of LNG carriers and tugs in the waterway would contribute to an increase in the background noise level. However, given the relative low frequency of ship and tug traffic, the overall day and nighttime-weighted noise level should not change significantly from existing background conditions.

The nearest NSA to the proposed LNG terminal is located adjacent to the north side of the boundary for the 411-acre property controlled by NorthernStar. Noise impact modeling indicates that noise generated by operation of the proposed LNG terminal would be lower than the FERC sound level requirement of 55 dBA L_{dn} , but slightly higher than the nighttime L_{eq} of 50 dBA at the second closest NSA (the sound level would be lower than both the FERC required L_{dn} and L_{eq} at the closest NSA). To minimize the noise impact on nearby NSAs from LNG terminal operations, NorthernStar would incorporate the following noise attenuation measures: noise barriers or enclosures to block sound transmission from operating equipment; valves with "low-noise" trims; acoustical insulation for aboveground piping; and equipment types with the least noise emissions. We are recommending that NorthernStar file the results of a noise survey after the terminal is operating to document that noise at the nearby NSAs does not exceed 55 dBA L_{dn} .

Dredging activities to create the turning basin would continue all day for up to 72 consecutive days, with dredging noise estimated to exceed 66 dBA at the nearest NSAs. In order to protect residents of Puget Island from excessive dredging noise, we are recommending that NorthernStar file for review and approval a finalized dredging noise mitigation plan prior to construction. HDDs would also drill for 24 hours straight over several days or weeks, and noise from this drilling may affect nearby residences. Therefore, we are recommending that NorthernStar file a revised HDD noise mitigation plan identifying the noise mitigation measures and monitoring to be implemented during HDD activities to reduce noise levels at nearby NSAs to no more than 10 dBA above ambient noise levels if the resulting impact is above 55 dBA L_{dn} .

Operation of the proposed pipeline would generate noise at only four locations where pressure reduction valves for taps would be located aboveground. Because these facilities would operate 24 hours per day, they would need to meet the nighttime standards specified in the applicable noise codes.

NorthernStar would provide noise attenuation to meet the 55 dBA L_{dn} noise standard, if required. Based on preliminary engineering and the noise estimates, the Wauna Mill, Northwest Natural, and Williams Northwest pipeline valves would likely require additional noise control, such as enclosures, beyond selection of particular valve types. NorthernStar has prepared a noise mitigation plan for the Wauna Mill, Northwest Natural, and Williams Northwest pipeline valves to reduce noise at the NSAs to meet 55 dBA L_{dn} . We are recommending that NorthernStar file noise surveys no later than 60 days after placing the valves into service and proposed mitigation if 55 dBA L_{dn} is not met.

5.1.11 Reliability and Safety

We evaluated the safety of both the proposed facilities and the related LNG vessel transit through the Columbia River navigation channel. As part of our evaluation, we performed a cryogenic design and technical review of the proposed terminal design and safety systems. Several areas of concern were noted with respect to the proposed facility, and we identified specific recommendations to be addressed by NorthernStar before initial site preparation, before construction after final design, before commissioning, or before commencement of service.

Thermal radiation distances were calculated for 1,600 to 10,000 Btu/ft²-hr incident flux levels for an LNG storage tank impoundment fire. The resulting distances would be 377 feet for the 10,000 Btu/ft²-hr zone; 714 feet for the 3,000 Btu/ft²-hr zone; and 912 feet for the 1,600 Btu/ft²-hr zone, which all stay on site. Flammable vapor hazard distances were calculated for accident scenarios in the process area which resulted in a distance of 325 feet to the 2.5 percent average gas concentration.

Thermal radiation and flammable vapor hazard distances were calculated for an accident or an attack on a 140,000-m³ LNG carrier. For 1.0-, 1.4-, 2.5-, 3.0-, and 3.9-meter-diameter holes in an LNG cargo tank, we estimated distances to range from 2,154 to 5,225 feet for a thermal radiation level of 1,600 Btu/ft²-hr, the level which is hazardous to unprotected persons located outdoors. Based on a 1.0-meter-diameter hole, an unignited release would result in an estimated pool radius of 421 feet. The unignited vapor cloud would extend to 10,237 feet to the LFL and 13,618 feet to one-half the LFL. The results of these calculations are in agreement with the Zones of Concern use by the Coast Guard in assessing waterway suitability. Flammable vapor dispersion for larger holes was not performed since, realistically, the cloud would not even extend to the maximum distance for a 1.0-meter-diameter hole before encountering an ignition source. However, the evaluation of safety is more than an exercise in calculating the consequences of worst case scenarios. Rather, it is a determination of the acceptability of risk which considers: the probability of events, the effect of mitigation, and the consequences of events. Based on the extensive operational experience of LNG shipping, the structural design of an LNG vessel, and the operational controls imposed by the Coast Guard and the local pilots, the likelihood of a cargo containment failure and subsequent LNG spill from a vessel casualty – collision, grounding, or allision – is highly unlikely. As a result, the risk to the public from accidental spills from LNG carriers should be considered negligible.

Unlike accidental causes, historical experience provides little guidance in estimating the probability of a terrorist attack on an LNG vessel. For an LNG import terminal proposal that would involve having a large volume of energy transported and stored, the perceived threat of a terrorist attack is a primary concern of the local population and requires that resources be directed to mitigate possible attack paths. While the risks associated with the transportation of any hazardous cargo can never be entirely eliminated, they can be managed.

In accordance with 33 CFR 127.007, NorthernStar submitted an LOI to the Coast Guard on January 18, 2005 conveying its intention to construct and operate an LNG import terminal at the proposed site. In December 2005, NorthernStar submitted a preliminary WSA to the Coast Guard in accordance

with the guidance in NVIC 05-05. Based on feedback from the Coast Guard and other stakeholders, NorthernStar prepared a follow-on WSA, which was submitted to the Coast Guard in May 2006. The Coast Guard, with input from the Area Maritime Security Committee, local law enforcement, and emergency response organizations, completed a review of NorthernStar's WSA in accordance with the guidance in NVIC 05-05. The WSA review focused on the navigation safety and maritime security risks posed by LNG marine traffic, and the measures needed to responsibly manage these security risks.

As part of our marine traffic analysis, we considered how vessel security requirements for LNG carriers calling on the proposed LNG terminal might affect other ship and boat traffic in the Columbia River. Based on the Coast Guard's review of NorthernStar's WSA and consultations, the Coast Guard advised the FERC in its WSR dated February 28, 2007 that to make the Columbia River suitable for the LNG marine traffic associated with the Bradwood Landing Project, specific risk mitigation measures would be necessary such as the safety and security zones described above.

While the LOR would address the suitability of Columbia River navigation channel for LNG marine transportation, it would not constitute a final authority to commence LNG operations. Issues related to the public impact of safety and security zones would be addressed later in the development of the Coast Guard's *LNG Vessel Transit Management Plan*. This plan would be developed in conjunction with state and local law enforcement and emergency response communities.

An issue that has developed for several LNG terminal projects, including the Bradwood Landing Project, is a concern that local communities would have to bear some of the costs of ensuring the security/emergency management of the LNG facility and the LNG vessel while in transit and unloading at the dock. The specific security/emergency management costs for the proposed project are not yet available. The final costs associated with security would be determined after the specific security needs and responsibilities have been established by the Coast Guard through consultations with other federal, state, and local agencies.

Section 3A(e) of the NGA, added by section 311 of the EPOA of 2005, requires the LNG terminal operator to develop an ERP in consultation with the Coast Guard and state and local agencies. On March 24, 2008, NorthernStar filed a draft ERP with FERC for review. The draft ERP submitted by NorthernStar is still in the process of being completed and items required to be included in the ERP, such as the Cost Sharing Plan, have not yet been finalized. Therefore, we are recommending that NorthernStar develop an ERP (including evacuation) and coordinate procedures with the Coast Guard; state, county, and local emergency planning groups; fire departments; state and local law enforcement; and appropriate federal agencies. The ERP must include a Cost-Sharing Plan that contains a description of any direct cost reimbursements the applicant agrees to provide to any state and local agencies with responsibility for security and safety at the LNG terminal and near vessels that serve the facility.

We have identified a segment of pipeline through a Class 3 area, between MPs 13.17 and 13.43, where the nearest MLV would be located more than 5.3 miles away at MP 18.8. According to DOT regulations, an MLV must be located within 4 miles of a Class 3 area, unless the DOT administrator finds that alternative spacing would offer an equivalent measure of protection to the public. Therefore, we are recommending that, prior to construction, NorthernStar should either document that the DOT has approved its MLV spacing, or provide, for the review and written approval of the Director of OEP, a modified pipeline design that adheres to the requirements of 49 CFR 192.179.

5.1.12 Alternatives

The EIS addresses alternatives to the proposed action. Alternatives considered by the FERC include no action or postponed action, system alternatives, LNG terminal site alternatives, LNG terminal

layout alternatives, and pipeline route alternatives. While denying project approval or taking no action (or postponing action) would eliminate the environmental impacts identified in this EIS, the project objective would not be met of providing a new source of natural gas to the Pacific Northwest. Two possible outcomes of the no action alternative would be: 1) economic impacts associated with limited future supplies of natural gas; and/or 2) the development of other natural gas infrastructure projects to meet growing future regional demands and the environmental impacts associated with the construction of those other projects.

We considered if existing natural gas pipeline systems in the region could be expanded to meet the project objectives by supplying volumes equivalent to those proposed by NorthernStar. Although five LNG “peak shaving” storage facilities are currently located in the Pacific Northwest, converting any of these facilities into an import terminal would not be feasible.

We considered five newly proposed jurisdictional interstate pipelines as system alternatives to the Bradwood Landing Project. One of these pipelines (Palomar) could bring Canadian and Rocky Mountain gas to the Portland metropolitan area. The potential Sunstone and Blue Bridge projects would increase the amount of Rocky Mountain natural gas that could be transported on the Williams Northwest and GTN systems to serve markets in the Pacific Northwest, northern California, and northern Nevada. The Ruby and Bronco pipeline projects, which are in different stages of review, would both transport Rocky Mountain gas to the Oregon/California border. These proposed pipelines would not be environmentally preferable system alternatives because they are longer than the sendout pipeline for the Bradwood Landing Project. However, the FERC would review each of these proposals individually, on their own merits, if they file applications, and if authorized, market conditions would determine which projects are ultimately built and put into service.

We considered if other LNG import terminals proposed for the west coast of North America could serve as reasonable alternatives to replace the Bradwood Landing Project. These include: the WestPac LNG Facility and Kitimat LNG Terminal in British Columbia, Canada; Energia Costa Azul LNG Facility in Ensanada, Mexico; Terminal GNL de Sonora near Puerto Libertad, Mexico; and the Long Beach LNG Import Project and the Clearwater, Cabrillo and Ocean Way deep water port proposals in southern California. We concluded that some of these projects are not feasible, and none would meet all the objectives of the Bradwood Landing Project.

We considered alternative LNG terminal locations along the coast of Washington and Oregon that would be accessible to LNG carriers and within a reasonable distance of an interstate pipeline system. Sites in the Puget Sound area or Grays Harbor area of Washington do not appear to be environmentally preferable to the Bradwood Landing Project, and those locations have constraints which have prevented them so far from being considered by potential developers as LNG import terminals. In September 2007, Jordan Cove filed an application with the FERC for a proposed LNG import terminal in Coos Bay, Oregon and PCGP filed its application for a 230-mile-long sendout pipeline. The Oregon LNG Project in Warrenton, Oregon and its associated 121-mile-long sendout pipeline are currently being studied under the FERC’s Pre-filing Review Process. Neither the Jordan Cove nor the Oregon LNG projects appear to be environmentally superior to the Bradwood Landing Project, because of their longer sendout pipelines. However, the FERC will conduct an independent environmental review of the Jordan Cove and Oregon LNG projects, and would make decisions based on their individual merits. The Commission does not choose between competing projects, and if any of the LNG terminals in Oregon are authorized the market would ultimately determine which projects are viable.

We also examined other potential LNG import terminal locations along the lower Columbia River in Oregon. No developer is currently proposing either the Tansy Point or Port Westward site under the FERC Pre-filing Review Process. Our initial review of those locations found that they have no clear

environmental advantages over the Bradwood Landing LNG Project. An offshore LNG import terminal near the mouth of the Columbia River would not be a viable alternative to the Bradwood Landing Project due to deep, rough sea conditions off the Oregon Coast; technological limitations associated with an offshore terminal; and the additional environmental impacts associated with the longer sendout pipeline.

We reviewed various alternative designs for facilities at Bradwood Landing, and concluded that the current proposal is reasonable given technical, engineering, safety, and environmental considerations. Furthermore, we did not identify dredged material placement alternatives that were technically, economically, and/or environmentally preferable to the proposed action of placing the material at the LNG terminal site and the Wahkiakum County Sand Pit site.

We evaluated four major sendout pipeline routes as alternatives to the route proposed by NorthernStar, but none would provide significant environmental advantages over the proposed pipeline route. A number of minor route variations were also considered in an effort to eliminate or minimize potential impacts on specific localized resources, including residences, wetlands, or waterbodies. In some cases NorthernStar adopted minor route variations that we agree are environmentally preferable, in other cases we agree that the minor route variation alternative offered no clear environmental advantages over NorthernStar's selected proposed route.

The proposed action for the Coast Guard is to issue an LOR finding the waterway suitable for LNG marine traffic with conditions. Among the conditions that may be included are: 1) establishment of a 500-yard moving safety/security zone during LNG vessel transit of the waterway, including the requirements for one-way LNG marine traffic along certain portions of the waterway such as at turns and for a 200-yard security zone around the LNG vessel when it is moored at the LNG terminal; 2) a 50-yard security zone around the LNG terminal when there is not a vessel at the dock; 3) annual review by NorthernStar of its WSA to evaluate if any conditions in the waterway have changed that would require issuance of a new LOR and submittal of the annual review to the COTP for his/her review and issuance of a new LOR if necessary; 4) the requirement that LNG vessels must board a pilot(s) at least 5 miles before the CR Buoy and for at least the first 6 months, at least two pilots must be on board throughout the transit and that at least two tugs escort the vessel along the waterway with a third to assist with turning and mooring; 5) implementation of a Coast Guard-approved *LNG Vessel Transit Management Plan*; 6) improvements to the Columbia River's Vessel Traffic Information System; and 7) availability of Coast Guard as well as other safety and security resources to implement the above security measures. If these and other conditions to the LOR are imposed, the potential for accidental releases or releases from terrorist attacks would be minimized.

Reasonable alternatives to the Coast Guard's proposed action with conditions include: 1) issuance of a Coast Guard LOR finding the waterway suitable for LNG marine traffic without conditions; and 2) issuance of a Coast Guard LOR finding the waterway not suitable for LNG marine traffic (no action alternative). The Coast Guard's preferred alternative is to issue an LOR finding the waterway suitable for LNG traffic with certain conditions.

The no action alternative for the Coast Guard would avoid any project-related environmental effects in the waterway; however, it would also prevent LNG carriers from delivering LNG to the proposed import terminal and the project objectives would not be met. A reasonable alternative to the Coast Guard action of issuing an LOR, which finds the waterway suitable for LNG marine traffic with certain conditions, is to issue an LOR without any conditions. With this alternative, some of the adverse economic effects of the conditions would be lessened. However, the potential for adverse environmental effects would be greater if conditions were not imposed.

In summary, we have determined that NorthernStar's proposed project, as modified by our recommended mitigation measures, is the preferred alternative that can meet the project objectives.

5.2 FERC STAFF'S RECOMMENDED MITIGATION

If the Commission approves the proposed Bradwood Landing Project, we recommend that the Commission's authorizations include the measures recommended below to further mitigate the environmental impacts associated with the construction and operation of the proposed project.

1. NorthernStar shall follow the construction procedures and mitigation measures described in its application, supplemental filings (including responses to staff data requests), and as identified in the EIS, unless modified by the Order. NorthernStar must:
 - a. request any modification to these procedures, measures, or conditions in a filing with the Secretary;
 - b. justify each modification relative to site-specific conditions;
 - c. explain how that modification provides an equal or greater level of environmental protection than the original measure; and
 - d. receive approval in writing from the Director of the OEP **before using that modification.**
2. For pipeline facilities, the Director of OEP has delegated authority to take whatever steps are necessary to ensure the protection of all environmental resources **during construction and operation** of the Bradwood Landing Project. This authority shall allow:
 - a. the modification of conditions of the Commission's Order; and
 - b. the design and implementation of any additional measures deemed necessary (including stop work authority) to assure continued compliance with the intent of the environmental conditions as well as the avoidance or mitigation of adverse environmental impact resulting from project construction and operation.
3. For LNG facilities, the Director of OEP has delegated authority to take all steps necessary to ensure the protection of life, health, property, and the environment **during construction and operation** of the project. This authority shall include:
 - a. stop-work authority and authority to cease operation; and
 - b. the design and implementation of any additional measures deemed necessary to assure continued compliance with the intent of the conditions of the Order.
4. **Before any construction** for the LNG terminal and the pipeline, NorthernStar shall file an affirmative statement with the Secretary, certified by a senior company official, that all company personnel, EIs, and contractor personnel will be informed of the EI's authority and have been or will be trained on the implementation of the environmental mitigation measures appropriate to their jobs before becoming involved with construction and restoration activities.
5. The authorized facility locations shall be as shown in the EIS, as supplemented by filed alignment sheets, and shall include all of the staff's recommended facility locations. **As soon as they are available, and before the start of construction** for the LNG terminal and the pipeline, NorthernStar shall file with the Secretary any revised detailed survey alignment maps/sheets at a scale not smaller than 1:6,000 with station positions for all facilities approved by the Order. All requests for modifications of environmental conditions of the Order or site-specific clearances must be written and must reference locations designated on these alignment maps/sheets.

6. NorthernStar shall file with the Secretary detailed alignment maps/sheets and aerial photographs at a scale not smaller than 1:6,000 identifying all route realignments or facility relocations, and staging areas, pipe storage yards, new access roads, and other areas that would be used or disturbed and have not been previously identified in filings with the Secretary. Approval for each of these areas must be explicitly requested in writing. For each area, the request must include a description of the existing land use/cover type, and documentation of landowner approval, whether any cultural resources or federally listed threatened or endangered species would be affected, and whether any other environmentally sensitive areas are within or abutting the area. All areas shall be clearly identified on the maps/sheets/aerial photographs. Each area must be approved in writing by the Director of OEP **before construction** in or near that area.

This requirement does not apply to extra workspace allowed by the Plan, minor field realignments per landowner needs, and requirements which do not affect other landowners or sensitive environmental areas such as wetlands.

Examples of alterations requiring approval include all route realignments and facility location changes resulting from:

- a. implementation of cultural resources mitigation measures;
- b. implementation of endangered, threatened, or special concern species mitigation measures;
- c. recommendations by state regulatory authorities; and
- d. agreements with individual landowners that affect other landowners or could affect sensitive environmental areas.

- | 7. **At least 60 days before construction** of the LNG terminal and the pipeline begins, NorthernStar shall file an initial Implementation Plan with the Secretary for review and written approval by the Director of OEP describing how NorthernStar will implement the mitigation measures required by the Order. NorthernStar must file revisions to the plan as schedules change. The plan shall identify:

- a. how NorthernStar will incorporate these requirements into the contract bid documents, construction contracts (especially penalty clauses and specifications), and construction drawings so that the mitigation required at each site is clear to onsite construction and inspection personnel;
- b. the number of EIs assigned per spread, and how the company will ensure that sufficient personnel are available to implement the environmental mitigation;
- c. company personnel, including EIs and contractors, who will receive copies of the appropriate material;
- d. the training and instructions NorthernStar will give to all personnel involved with construction and restoration (initial and refresher training as the project progresses and personnel change), with the opportunity for OEP staff to participate in the training session(s);
- e. the company personnel (if known) and specific portion of NorthernStar's organization having responsibility for compliance;
- f. the procedures (including use of contract penalties) NorthernStar will follow if noncompliance occurs; and
- g. for each discrete facility, a Gantt or PERT chart (or similar project scheduling diagram), and dates for:

- (1) the completion of all required surveys and reports;

- (2) the mitigation training of onsite personnel;
 - (3) the start of construction; and
 - (4) the start and completion of restoration.
- 8. NorthernStar shall develop and implement an environmental complaint resolution procedure. The procedure shall provide landowners with clear and simple directions for identifying and resolving their environmental mitigation problems/concerns during construction of the project and restoration of the right-of-way. **Before construction** of the LNG terminal and the pipeline, NorthernStar shall mail the complaint procedures to each landowner whose property would be crossed by the project.
 - a. In its letter to affected landowners, NorthernStar shall:
 - (1) provide a local contact that the landowners shall call first with their concerns; the letter shall indicate how soon a landowner shall expect a response;
 - (2) instruct the landowners that, if they are not satisfied with the response, they shall call NorthernStar's Hotline; the letter shall indicate how soon to expect a response; and
 - (3) instruct the landowners that, if they are still not satisfied with the response from NorthernStar's Hotline, they shall contact the Commission's Enforcement Hotline at (888) 889-8030.
 - b. In addition, NorthernStar shall include in its weekly status report a copy of a table that contains the following information for each problem/concern:
 - (1) the date of the call;
 - (2) the identification number from the certificated alignment sheets of the affected property;
 - (3) the description of the problem/concern; and
 - (4) an explanation of how and when the problem was resolved, will be resolved, or why it has not been resolved.
- 9. NorthernStar shall employ at least one EI at the LNG terminal and one EI per pipeline spread. The EI shall be:
 - a. responsible for monitoring and ensuring compliance with all mitigation measures required by the Order and other grants, permits, certificates, or other authorizing documents;
 - b. responsible for evaluating the construction contractor's implementation of the environmental mitigation measures required in the contract (see condition 7 above) and any other authorizing document;
 - c. empowered to order correction of acts that violate the environmental conditions of the Order, and any other authorizing document;
 - d. responsible for documenting compliance with the environmental conditions of the Order, as well as any environmental conditions/permit requirements imposed by other federal, state, or local agencies; and
 - e. responsible for maintaining status reports.
- 10. NorthernStar shall file updated status reports prepared by the EI with the Secretary **on a weekly basis until all construction and restoration activities are complete**. On request, these status

reports will also be provided to other federal and state agencies with permitting responsibilities. Status reports shall include:

- a. the current construction status of the project, work planned for the following reporting period, and any schedule changes for stream crossings or work in other environmentally sensitive areas;
 - b. a listing of all problems encountered and each instance of noncompliance observed by the EI(s) during the reporting period (both for the conditions imposed by the Commission and any environmental conditions/permit requirements imposed by other federal, state, or local agencies);
 - c. corrective actions implemented in response to all instances of noncompliance, and their cost;
 - d. the effectiveness of all corrective actions implemented;
 - e. a description of any landowner/resident complaints which may relate to compliance with the requirements of the Order, and the measures taken to satisfy their concerns; and
 - f. copies of any correspondence received by NorthernStar from other federal, state or local permitting agencies concerning instances of noncompliance, and NorthernStar's response.
11. NorthernStar must receive written authorization from the Director of OEP **before commencing service** from the project. Such authorization will only be granted following a determination that the LNG facility has been constructed in accordance with Commission approval and applicable standards, can be expected to operate safely as designed, and the rehabilitation and restoration of the right-of-way is proceeding satisfactorily.
12. **Within 30 days of placing the authorized facilities in service**, NorthernStar shall file an affirmative statement with the Secretary, certified by a senior company official:
 - a. that the facilities have been constructed in compliance with all applicable conditions, and that continuing activities will be consistent with all applicable conditions; or
 - b. identifying which of the conditions of the order NorthernStar has complied with or will comply with. This statement shall also identify any areas affected by the project where compliance measures were not properly implemented, if not previously identified in filed status reports, and the reason for noncompliance.
13. NorthernStar shall continue to consult with the COE, NMFS, FWS, ODFW, ODSL, WDE, and other appropriate agencies to finalize its Compensatory Mitigation Plan. NorthernStar shall file the final Compensatory Mitigation Plan along with agency comments and appropriate approvals with the Secretary **prior to construction** of the LNG terminal and pipeline facilities. (*EIS Section 2.1.5*)
14. **Prior to pipeline construction**, NorthernStar shall file with the Commission the following information on the nonjurisdictional lateral pipeline facilities:
 - a. final routing and design information, including maps depicting the location of the facilities;
 - b. documentation of consultations with the appropriate agencies and the status of federal, state, or local permits or approvals required for their construction; and
 - c. status and copies of agency clearances (or copies of any surveys and reports prepared) for wetlands, threatened and endangered species, and cultural resources. (*EIS Section 2.2.2*)

15. NorthernStar shall develop and fund a third-party environmental monitoring program to be implemented **during construction** of the Bradwood Landing Project. The program shall allow for on-site, third-party compliance monitors representing the FERC to be present full-time during all pipeline construction phases, and periodically during LNG terminal construction, to ascertain that the project is being built as outlined in this EIS, and in accordance with the environmental conditions of the FERC Order. **Prior to construction**, NorthernStar shall file a plan describing the third-party environmental monitoring program with the Secretary for the review and written approval of the Director of OEP. (*EIS Section 2.6*)
16. NorthernStar shall be required to implement the following peer review process:
- a. **Prior to construction** of the LNG terminal and pipeline, NorthernStar shall retain a “Board of Consultants” (Board) composed of three or more qualified independent engineering consultants experienced in the critical disciplines of geotechnical, civil, structural, and mechanical engineering, to review the final design and to perform construction quality inspections of the civil and structural aspects of the project in accordance with the specifications contained in the FERC’s Draft Seismic Design Guidelines and Data Submittal Requirements for LNG Facilities (FERC Seismic Guidelines) and other measures agreed to by NorthernStar.
 - b. NorthernStar shall file with the Secretary the names and qualifications of the Board members for approval by the Director of OEP.
 - c. The Board shall certify that all civil and structural detailed design calculations, analyses, and construction documents are in compliance with all applicable codes and standards, project-specific civil, structural, and mechanical design criteria, and other engineering requirements of the Order, including the FERC Seismic Guidelines. The Board shall further certify, based on construction inspections by the Board that all civil and structural construction of the terminal facilities is in conformance with the project construction documents. The Board shall also certify that all procured equipment has been properly seismic qualified in conformance with the project-specific seismic qualification requirements, and the FERC Seismic Guidelines, that seismic detailing of structures has been properly implemented, and the pipeline has been designed to minimize the hazard of rupture due to ground instability.
 - d. Among other things, the Board shall assess the adequacy of the following:
 - final geotechnical investigations necessary to support all final foundation designs in satisfying the FERC Seismic Guidelines, and final pipeline routing/mitigation measures through geologically hazardous areas;
 - field tests and associated results used to verify ground improvement, pile driving, and all civil and structural construction;
 - selection and implementation of the final seismic design categorization of all structures, systems, and components of the LNG terminal in satisfying the FERC Seismic Design Guidelines;
 - proposed seismic recording instrumentation and shutdown alarms in satisfying the FERC Seismic Guidelines;
 - construction procedures and progress; and
 - continuous and/or periodic inspections made by the Board to ensure that the construction quality of all Seismic Category I, II, and III structures, systems, and components is acceptable.

- e. The Board shall meet as necessary to allow the timely progress of the final design approvals and construction of the project in accordance with NorthernStar's production of acceptable interim and final design data.
 - f. Before each meeting, NorthernStar shall file the following material with the Commission and furnish copies to members of the Board, and other appropriate federal and/or state agencies at the request of the Director of OEP:
 - a statement of the specific level of review the Board is expected to provide;
 - an agenda for the meeting;
 - a list of the items to be discussed;
 - a discussion of significant events in the design and construction that have occurred since the previous Board meeting;
 - drawings of the design and construction features; and
 - documentation of the details, calculations, and analyses of the design and construction features to be discussed.
 - g. NorthernStar shall ensure that the Commission and the Board has sufficient time to review all pertinent materials before each meeting.
 - h. **Within 30 days** of each Board meeting, NorthernStar shall file with the Commission copies of the Board's report and a statement of intent to comply with the Board's recommendations or a statement of a plan to resolve the issue(s). NorthernStar must provide detailed reasons for any recommendation of the Board not implemented.
 - i. The Board's review comments shall be submitted prior to or simultaneously with NorthernStar's request(s) for approval to proceed with any specific construction-related activities that may be required by the Order. The Director of OEP must approve in writing all requests to proceed with construction. *(EIS Section 4.1.3.3)*
17. **Prior to commissioning** of the LNG terminal or commencing service through the pipeline, NorthernStar shall file the Board's final report, which shall contain a statement indicating the Board's opinion with respect to the construction, safety, and adequacy of the LNG terminal structures and mitigation measures employed along the pipeline route in areas subject to ground instability. *(EIS Section 4.1.3.3)*
18. NorthernStar shall prepare a Shoreline Monitoring Plan for the west end of Puget Island that is similar in scope to the monitoring plan prepared for the Clatsop County Conditional Use Permit. The plan shall be filed with the Secretary for the review and written approval of the Director of OEP **prior to operation** of the LNG terminal. *(EIS Section 4.1.3.3)*
19. **Prior to construction** of the LNG terminal, NorthernStar shall file with the Secretary the following information regarding the new proposed construction worker parking lot, Bradwood Road, and Clifton Road: map of disturbed area; soils; impacts on upland vegetation, waterbodies and wetlands, and wildlife habitat; occurrence of state- or federally listed species; land use and zoning; cultural resources, and restoration plans. NorthernStar shall include status and copies of agency clearances for wetlands, threatened and endangered species, and cultural resources, as applicable. *(EIS Section 4.2.2.1)*
20. NorthernStar shall prepare its CMMP to address the discovery and management of contaminated soils and groundwater. This plan shall comply with applicable state and federal regulations and shall include procedures for the identification and management of unknown contaminants if any are encountered during construction of the proposed LNG terminal and pipeline facilities. The

plan shall be filed with the Secretary for the review and written approval of the Director of OEP **prior to construction.** (*EIS Section 4.2.2.1*)

21. NorthernStar shall prepare a plan to monitor the side slopes of the maneuvering area after dredging. The plan shall include slope protection measures, shall such mitigation be necessary. The plan shall be filed with the Secretary for the review and written approval of the Director of OEP **prior to construction** of the LNG terminal. (*EIS Section 4.2.2.2*)
22. NorthernStar shall revise its pipeline ESC Plan and SWPPP to include the measures from the FERC's Plan that provide greater protections. NorthernStar's revised plans shall be filed with the Secretary for the review and written approval of the Director of OEP **prior to construction** of the pipeline. (*EIS Section 4.2.3.2*)
23. NorthernStar shall conduct water quality monitoring at points both 100 feet downstream and 100 feet upstream from the Hunt Creek Bridge **during demolition or construction activities.** In the event that water clarity exceeds a level approximately 10 percent above the baseline observation at the either monitoring point, work would cease **until** either the turbidity was cleared or it could be ascertained that the difference in turbidity levels was not due to construction activities. (*EIS Section 4.3.2.3*)
24. **Within 30 days** after the issuance of the final EIS, NorthernStar shall develop the following performance standards for water discharges at the Bradwood Landing terminal wharf:
 - a. standards for water temperature impacts due to discharging cooling water from LNG carriers into the Columbia River that shall include modeling to determine the temporal and spatial extent of impacts on water quality and salmonids; and
 - b. standards for impacts from biocide use that shall include specific forms and concentrations of biocide that would be used, the anticipated concentration of biocide at the discharge location, and modeling to determine the temporal and spatial extent of toxicity to aquatic resources. (*EIS Section 4.3.2.3*)
25. NorthernStar shall revise its *HDD Contingency Plan* to include mitigation measures for frac-outs to uplands. **Prior to pipeline construction,** the revised *HDD Contingency Plan* shall be filed with the Secretary for the review and written approval of the Director of OEP. (*EIS Section 4.3.2.4*)
26. NorthernStar shall continue to consult with the COE, NMFS, FWS, and other appropriate federal and state agencies to finalize its *Waterbody and Wetland Construction and Mitigation Procedures Plan*. The final plan shall include the following:
 - a. a description of the specific methods of in-water habitat mitigation to be conducted;
 - b. measures to prevent the spread of invasive species due to construction activities within waterbodies; and
 - c. procedures for monitoring the success of the revegetation and weed control efforts.

The plan, including agency comments on the plan, shall be filed with the Secretary for review and written approval by the Director of OEP **prior to pipeline construction.** (*EIS Section 4.3.2.4*)
27. **Prior to activities** within the pipe storage and contractor yard in Washington, wetlands potentially affected by activities within the yard shall be fenced. Construction activities shall not

occur within 50 feet of any wetland without prior review and written approval by the Director of OEP. (*EIS Section 4.4.1.3*)

28. **During construction**, NorthernStar shall implement the following measures at the three extra temporary workspaces listed below and in table 4.4.1-7 that would be within 50 feet of wetlands:
 - a. B0505 – Wetland shall be fenced and avoided regardless of the presence of saturated conditions during construction activities.
 - b. EST-3 – The pull string section for the Abernathy Creek HDD shall avoid this wetland and the waterbody located within the wetland boundaries.
 - c. AA0424 – The extra workspace shall be relocated and centered on the upland area approximately 250 feet west of the current location. (*EIS Section 4.4.1.3*)
29. NorthernStar shall continue to consult with the COE, FWS, NMFS, Oregon and Washington Departments of Agriculture, and other appropriate resource agencies to revise its *Noxious Weeds and Soil-borne Plant Disease Control Plan*. NorthernStar shall file the final *Noxious Weeds and Soil-borne Disease Control Plan* along with agency approvals with the Secretary **within 30 days** after issuance of the final EIS. (*EIS Section 4.4.2.3*)
30. NorthernStar shall coordinate with the NMFS to determine appropriate LNG carrier speed, or other applicable measures, to avoid or minimize impacts on juvenile fish from wake stranding and shoreline erosion due to LNG carrier transit along the waterway. Results of modeling and coordination, including any specific measures to be implemented, shall be filed with the Secretary, **within 30 days** after issuance of the final EIS. (*EIS Section 4.5.1.1*)
31. NorthernStar shall consult with the appropriate federal and state agencies to develop a revised Bubble Curtain Contingency Plan that establishes a performance standard to assess whether or not bubble curtains are adequately working. The plan shall describe specific noise attenuation methods to be implemented if monitoring indicates poor noise attenuation performance. The plan, including agency comments on the plan, shall be filed with the Secretary for the review and written approval of the Director of OEP **prior to beginning offshore pile driving activities** at the LNG terminal. (*EIS Section 4.5.2.1*)
32. **During fish collection efforts** at the former mill log pond at the LNG terminal, NorthernStar shall place nets at the outlet of the log pond that only allow emigration from the pond (e.g., winged fyke net without collection chamber attached or two disconnected block nets oriented outward from the pond). (*EIS Section 4.5.2.1*)
33. NorthernStar shall conduct **post-installation** water flow mapping through all intake screens at the LNG terminal, and develop and implement a monitoring program to assess the effects of impingement and entrainment from use of the screened water supply system on juvenile salmonids during terminal operations. The monitoring program and water flow mapping plans shall be developed in consultation with the NMFS and ODFW and, as appropriate, incorporate adaptive management strategies to identify and mitigate any adverse effects specifically associated with the project. The final monitoring program and water flow mapping results, as well as any agency comments, shall be filed with the Secretary for the review and written approval of the Director of OEP **prior to operation of the screens**. In addition, NorthernStar shall provide **annual reports** to both the FERC and NMFS regarding the efficacy of the screened water intake system, which would identify any problems and address how such problems would be rectified. (*EIS Section 4.5.2.1*)

34. **Within 30 days** of the issuance of the final EIS, NorthernStar shall:

- a. prepare a plan that outlines how NorthernStar would ensure only LNG carriers that are retrofitted to use the proposed screened water supply system at the wharf are allowed to unload cargo at the Bradwood Landing terminal. The plan shall include a method of certifying to the FERC, in advance of a LNG carrier's initial call to the Bradwood Landing terminal, that the LNG carrier has been retrofitted to utilize NorthernStar's screened water intake system; or
- b. develop a plan for delivering screened engine cooling and ballast water to LNG carriers at the Bradwood Landing terminal that does not require carrier retrofitting.

The proposed screened water supply system design plan shall include monitoring, reporting, and adaptive management strategies to assure the system's efficacy at minimizing entrainment and impingement of sensitive species of juvenile fish. *(EIS Section 4.5.2.1)*

35. **Prior to initial site preparation** at the LNG terminal, NorthernStar shall file the final screened water system design plans and performance standards, along with NMFS comments on the plans and standards, with the Secretary for review and written approval by the Director of OEP. *(EIS Section 4.5.2.1)*

36. NorthernStar shall continue to consult with the NMFS, FWS, ODFW, and other appropriate agencies regarding revisions to its Lighting Plan. NorthernStar shall file its final Lighting Plan along with agency comments with the Secretary for review and written approval by the Director of OEP **prior to operation** of the LNG terminal. *(EIS Section 4.5.2.1)*

37. NorthernStar shall consult with the NMFS, FWS, ODFW, and other appropriate agencies in developing its Blasting Management Plan relative to the proposed noise mitigation measures. NorthernStar shall file its Blasting Management Plan along with agency comments on the plan with the Secretary **prior to blasting activities**. *(EIS Section 4.5.2.3)*

38. NorthernStar shall coordinate with the NMFS to determine appropriate LNG carrier speed and seasonal restrictions, or other restrictions to be implemented, to avoid or minimize impacts on whales. Results of the coordination, including a discussion of restrictions to be implemented, shall be filed with the Secretary, **within 30 days** after issuance of the final EIS. *(EIS Section 4.6.2.1)*

39. **Prior to construction** of the LNG terminal and pipeline facilities, NorthernStar shall conduct additional botanical surveys, where necessary, for federally listed endangered and threatened plants in the appropriate habitats within the project area during the appropriate survey period. **Before the initiation** of surveys, NorthernStar shall consult with the FWS for appropriate survey methods and periods for each species. If project facilities are not constructed **within 1 year** from the date of issuance of authorizations, NorthernStar shall consult with the appropriate offices of the FWS to update the species list and to determine if additional surveys are required. The survey reports and any FWS comments on the survey and its conclusions shall be filed with the Secretary. The survey reports shall include the following information:

- a. name(s) and qualifications of the person(s) conducting the survey;
- b. method(s) used to conduct the survey;
- c. date(s) of the survey;
- d. area surveyed (include the mileposts surveyed); and
- e. proposed mitigation measures that would substantially minimize or avoid potential impacts on listed endangered or threatened plants found in the project area.

NorthernStar must receive written approval from the Director of OEP **before implementing any mitigation measures.** (*EIS Section 4.6.2.2*)

40. NorthernStar shall conduct a survey for bald eagles, where necessary, **prior to construction** of the LNG terminal and pipeline facilities. **Before the initiation** of surveys, NorthernStar shall consult with the FWS, ODFW, and WDFW for appropriate survey methods and periods for the surveys. The survey reports and any agency comments on the survey and its conclusions shall be filed with the Secretary. The survey reports shall include the following information:
- a. name(s) and qualifications of the person(s) conducting the survey;
 - b. method(s) used to conduct the survey;
 - c. date(s) of the survey;
 - d. area surveyed (include the mileposts surveyed); and
 - e. proposed mitigation measures that would substantially minimize or avoid potential impacts on bald eagles found in the project area.

NorthernStar must receive written approval from the Director of OEP **before implementing any mitigation measures.** (*EIS Section 4.6.2.2*)

41. NorthernStar shall expand the protective measures that would be used to avoid or minimize impacts on Steller sea lions **during construction** of the LNG terminal (e.g., safety, buffer, and noise impact zones) to include all pinnipeds. (*EIS Section 4.6.2.2*)
42. NorthernStar shall consult with the FWS and other appropriate agencies to develop a Migratory Bird Nest Avoidance Plan to minimize impacts on migratory birds during the peak nesting season. NorthernStar shall file its Migratory Bird Nest Avoidance Plan along with agency comments with the Secretary **prior to the commencement** of clearing activities at the LNG terminal and the pipeline. (*EIS Section 4.6.2.2*)
43. Pipeline construction activities shall not occur within potential habitat for Columbian white-tailed deer (MPs 4 to 19) **between June 1 and July 15.** (*EIS Section 4.6.2.3*)
44. NorthernStar shall not begin construction activities at the LNG terminal and the pipeline **until**:
- a. the staff completes formal consultation with the NMFS and FWS;
 - b. NorthernStar completes consultation with the NMFS under section 101(a)(5)(D) of the MMPA; and
 - c. NorthernStar has received written notification from the Director of OEP that construction or use of mitigation may begin. (*EIS Section 4.6.3*)
45. **Prior to construction** of the LNG terminal and the pipeline, NorthernStar shall file with the Secretary documentation of concurrence from the ODLCD that the project is consistent with the CZMA. (*EIS Section 4.7.2.4*)
46. **Before pipeline construction** begins, NorthernStar shall file with the Secretary, for the review and written approval of the Director of OEP, a plan outlining measures that shall be implemented to mitigate pipeline construction impacts on domestic water supply systems and septic systems. For all residences located within 50 feet of the pipeline construction work area, **during construction** of the pipeline, NorthernStar shall:

- a. not remove mature trees and landscaping within the edge of the construction work area, unless necessary for safe operation of construction equipment;
 - b. immediately after backfilling the trench, restore all lawn areas and landscaping within the construction work area consistent with the requirements of the FERC staff's Plan;
 - c. fence the edge of the construction work area adjacent to the residence for a distance of 100 feet on either side of the residence to ensure that construction equipment and materials, including the spoil pile, remain within the construction work area;
 - d. try to maintain a minimum distance of 25 feet between the residence and the edge of the construction work area; and
 - e. for any residence closer than 25 feet to the construction work area, file a site-specific plan with the Secretary for the review and written approval of the Director of OEP **before construction**. The plan shall include:
 - (1) a description of construction techniques to be used (such as reduced pipeline separation, centerline adjustment, use of stove-pipe or drag-section techniques, working over existing pipelines, pipeline crossover, bore, etc.), and include a dimensioned site plan that shows:
 - i. the location of the residence in relation to the new pipeline and, where appropriate, the existing pipelines;
 - ii. the edge of the construction work area;
 - iii. the edge of the new permanent right-of-way; and
 - iv. other nearby residences, structures, roads, or waterbodies.
 - (2) a description of how NorthernStar would ensure the trench is not excavated until the pipe is ready for installation and the trench is backfilled immediately after pipe installation; and
 - (3) evidence of landowner concurrence if the construction work area and fencing would be located within 10 feet of a residence. (*EIS Section 4.7.3.3*)
47. **Prior to construction** of the pipeline, NorthernStar shall study Cowlitz County records to determine all plans for future residential and commercial developments along the proposed pipeline route in Washington, and file the results of that study with the Secretary, for the review and written approval of the Director of OEP. The study shall specifically include the Castle family house plans, and provide details about how NorthernStar would avoid or mitigate impacts on that future residence, including the distance (in feet) from the proposed house to the pipeline construction right-of-way. (*EIS Section 4.7.3.3*)
48. **Prior to pipeline construction**, NorthernStar shall document that it has consulted with the Port of St. Helens, the Columbia County Development Agency, and other appropriate agencies and representatives of Columbia County, to determine if its pipeline may have impacts on county improvements in the vicinity of the Port Westward Industrial Area, and file with the Secretary a plan to avoid or mitigate those impacts, for the review and approval of the Director of OEP. (*EIS Section 4.7.3.3*)
49. NorthernStar shall file with the Secretary a copy of the final Railroad Relocation Agreement **prior to LNG terminal construction**. (*EIS Section 4.8.2.7*)
50. NorthernStar shall consult with the ODOT, WDOT, and appropriate local agencies in the development of its final traffic management plan. The final traffic management plan shall include the design for improvements along Highway 30 and Clifton Road, and measures to

reduce impacts on narrow roads that would be used to access the construction right-of-way. **Prior to construction** of the LNG terminal and the pipeline, NorthernStar shall file its final traffic management plan, and documentation of consultations with the ODOT, WDOT, and local county government agencies, with the Secretary for the review and written approval of the Director of OEP. (*EIS Section 4.8.3.7*)

51. **Prior to construction** of the LNG terminal and the pipeline, NorthernStar shall file with the Secretary:
 - a. documentation that it re-initiated consultations with all Indian tribes listed on table 4.9.3-1 of the final EIS, and copies of correspondence to and from Indian tribes that expressed interest in its project after the issuance of the draft EIS (in August 2007); and
 - b. documentation that it provided copies of revised reports of cultural resources investigations to all Indian tribes that have expressed an interest in the project, including the Confederated Tribes of the Grande Ronde Reservation, and copies of any comments the tribes may have on those reports. (*EIS Section 4.9.3*)
52. NorthernStar shall defer construction and use of its proposed facilities, including related ancillary areas for staging, storage, temporary work areas, and new or to-be-improved access roads **until**:
 - a. NorthernStar files with the Secretary all additional required cultural resources survey and evaluation reports, any necessary treatment/avoidance plans, and a cultural resources management plan;
 - b. NorthernStar files with the Secretary comments of the Oregon and Washington SHPOs on all cultural resources investigation reports and plans;
 - c. the ACHP has been given an opportunity to comment, if any historic properties would be adversely affected by the project; and
 - d. the Director of OEP reviews and approves all cultural resources investigation reports and plans, and notifies NorthernStar in writing that treatment plans/mitigation measures may be implemented or construction may proceed.

All material filed with the Commission containing **location, character, and ownership information** about cultural resources must have the cover and any relevant pages therein clearly labeled in bold lettering: “**CONTAINS PRIVILEGED INFORMATION - DO NOT RELEASE.**” (*EIS Section 4.9.4*)

53. **Prior to LNG terminal construction**, NorthernStar shall file with the Secretary, for review and written approval by the Director of OEP, a finalized dredging noise mitigation plan. This plan shall identify all noise mitigation which NorthernStar would implement during dredging to reduce noise at the NSAs. Specifically, during dredging operations NorthernStar shall monitor noise and make all reasonable efforts to restrict noise increases from operations to no more than 10 dBA above ambient if the resulting impact is above 55 dBA L_{dn} . (*EIS Section 4.10.2.2*)
54. NorthernStar shall file a noise survey for the terminal with the Secretary **no later than 60 days** after placing the LNG terminal in service. If the noise attributable to the operation of the LNG terminal exceeds 55 dBA L_{dn} at any nearby NSAs, NorthernStar shall file a report on what changes are needed and shall install additional noise controls to meet the level **within 1 year** of the in-service date. NorthernStar shall confirm compliance with these requirements by filing a second noise survey with the Secretary **no later than 60 days** after it installs the additional noise controls. (*EIS Section 4.10.2.2*)

55. **Prior to pipeline construction**, NorthernStar shall file with the Secretary, for the review and written approval by the Director of OEP, a finalized noise mitigation plan for HDD sites Nos. 3, 5, 7, 8, 9, 10, 11, 12, 13, as identified in table 4.10.2-6 of the final EIS. This plan shall identify all noise mitigation that NorthernStar would implement during drilling activity to reduce noise at any nearby NSAs. Specifically, during HDD operations NorthernStar shall monitor noise and make all reasonable efforts to restrict noise increases from HDD operations to no more than 10 dBA above ambient if the resulting impact is above 55 dBA L_{dn} . (*EIS Section 4.10.2.3*)
56. NorthernStar shall file noise surveys with the Secretary **no later than 60 days** after placing the Wauna Mill, Northwest Natural, PGE Beaver Power Plant, and Williams Northwest pipeline valves into service. If the noise attributable to the operation of the authorized pipeline valves exceeds an L_{dn} of 55 dBA at any nearby NSAs, NorthernStar shall file a report on what changes are needed and shall install the additional noise controls to meet the level within **1 year** of the in-service date. NorthernStar shall confirm compliance with the above requirement by filing a second noise survey with the Secretary **no later than 60 days** after it installs the additional noise controls. (*EIS Section 4.10.2.3*)
57. **Prior to construction**, NorthernStar shall either: a) submit a determination from the DOT documenting agreement with the proposed pipeline valve locations, or b) submit for the review and written approval by the Director of OEP modified pipeline design plans demonstrating compliance with 49 CFR 192.179. (*EIS Section 4.11.9.1*)

Recommendation numbers 58 through 71 shall apply to the project design and construction details. Information pertaining to these specific recommendations shall be filed with the Secretary for review and approval by the Director of OEP either: prior to initial site preparation; prior to commencing final design; prior to construction; or prior to commissioning as indicated by each specific condition. All detailed design documents (drawings, calculations, specifications, etc.) and design submittals shall satisfy the requirements of Section 4, Part II of the FERC's draft "Seismic Design Guidelines and Data Submittal Requirements for LNG Facilities," January 2007 (FERC Seismic Guidelines).

58. Seismic specifications to be used in conjunction with the procuring equipment as described in section 3.10 of Part II of the FERC Seismic Guidelines shall be submitted for review **prior to commencing final design**. (*EIS Section 4.1.3.3*)
59. Quality Control and Assurance procedures as described in section 3.11 of Part II of the FERC Seismic Guidelines that will be used for design and construction shall be submitted for review **prior to commencing final design** of the project. (*EIS Section 4.1.3.3*)
60. A list of Seismic Category assignments for all structures, systems and components shall be submitted **prior to commencing final design** for review as described in section 3.6 of Part II of the FERC Seismic Guidelines. (*EIS Section 4.1.3.3*)
61. Seismic Design Criteria shall be provided for all Seismic Design Category I, II, and III structures, systems, and components as described in section 3.7 of Part II of the FERC Seismic Guidelines **prior to commencing final design**. The Seismic Design Criteria shall satisfy Part I of the FERC Seismic Guidelines. (*EIS Section 4.1.3.3*)
62. LNG Tank (including outer containment tank) and Foundation Preliminary Design shall comply with Part I of the FERC Seismic Guidelines. In particular, site response analysis and soil structure interaction analysis shall comply with section 6 of Part I and section 3.5.1 (10) and (11)

of Part II of the FERC Seismic Guidelines. LNG tank preliminary design drawings and structural calculations as requested in Section 3.9 of Part II of FERC Seismic Guidelines shall be submitted for review **prior to commencing final design**. Final LNG Tank (including outer tank) and foundation detailed design drawings and structural calculations that demonstrate compliance with Part I of FERC Seismic Guidelines shall be submitted for review **prior to construction**. (*EIS Section 4.1.3.3*)

63. MCE and DE seismic design ground motions shall satisfy section 5 of Part I of the FERC Seismic Guidelines. Submittals that demonstrate compliance shall be provided **prior to commencing final design**. (*EIS Section 4.1.3.3*)
64. SSE and OBE seismic design ground motions shall satisfy section 5 of Part I of the FERC Seismic Guidelines. Submittals that demonstrate compliance shall be provided **prior to commencing final design**. (*EIS Section 4.1.3.3*)
65. Details of the liquefaction mitigation method(s), procedures, plan extent, and verification methods proposed to verify mitigation of liquefaction potential shall be provided **prior to commencing final design**. (*EIS Section 4.1.3.3*)
66. Detailed calculations of seismic slope stability and lateral movements anticipated after the liquefaction mitigation is implemented shall be provided **prior to commencing final design** to verify the stability of critical structures for the project design earthquake motions. (*EIS Section 4.1.3.3*)
67. Details of the types of piles finally selected for supporting the LNG tanks and results of indicator pile program, including load tests, shall be submitted for review and approval **prior to construction/pile installation**. (*EIS Section 4.1.3.3*)
68. Final foundation design recommendations including pile foundation design and/or liquefaction mitigation measures for all other structures shall be submitted for review and approval **prior to construction**. The foundation design and/or liquefaction measures shall satisfy the FERC Seismic Guidelines. (*EIS Section 4.1.3.3*)
69. All other items identified in the submitted geotechnical/seismic reports which were proposed to be addressed during the detailed design shall be submitted for review and approval **prior to construction**. (*EIS Section 4.1.3.3*)
70. A seismic instrumentation plan as described in section 3.12 of Part II of the FERC Seismic Guidelines shall be provided **prior to commissioning**. (*EIS Section 4.1.3.3*)
71. The results of the hydrostatic load tests on the LNG storage tanks, including settlement data as described in section 7.4.1 shall be provided **prior to commissioning**. (*EIS Section 4.1.3.3*)

Recommendation numbers 72 through 105 shall apply to the project design and construction details. Information pertaining to these specific recommendations shall be filed with the Secretary for review and approval by the Director of OEP either: prior to initial site preparation; prior to construction of final design; prior to commissioning; or prior to commencement of service as indicated by each specific condition. Specific engineering, vulnerability, or detailed design information meeting the criteria specified in Order No. 683 (Docket No. RM06-24-000), including security information, shall be submitted as CEII pursuant to 18 CFR 388.112. See *Critical Energy Infrastructure Information*, Order No. 683, 71 Federal Register 58,273 (October 3, 2006), FERC

Statutes & Regulations ¶ 31,228 (2006). Information pertaining to items such as: off-site emergency response; procedures for public notification and evacuation; and construction and operating reporting requirements would be subject to public disclosure. All information shall be submitted a minimum of 30 days before approval to proceed is required.

72. **Prior to initial site preparation**, NorthernStar shall file calculations or a re-designed configuration showing how the troughs feeding the impoundment sumps would adequately handle a spill from the unloading line at the maximum unloading line rate. *(EIS Section 4.11.4)*
73. Complete plan drawings and a list of the hazard detection equipment shall be filed **prior to initial site preparation**. The list shall include the instrument tag number, type and location, alarm locations, and shutdown functions of the proposed hazard detection equipment. Plan drawings shall clearly show the location of all detection equipment. *(EIS Section 4.11.2)*
74. NorthernStar shall provide a technical review of its proposed facility design that:
 - a. identifies all combustion/ventilation air intake equipment and the distances to any possible hydrocarbon release (LNG, flammable refrigerants, flammable liquids and flammable gases); and
 - b. demonstrates that these areas are adequately covered by hazard detection devices and indicate how these devices would isolate or shutdown any combustion equipment whose continued operation could add to or sustain an emergency.

NorthernStar shall file this review **prior to initial site preparation**. *(EIS Section 4.11.2)*

75. Complete plan drawings and a list of the fixed and wheeled dry-chemical, fire extinguishing, and other hazard control equipment shall be filed **prior to initial site preparation**. The list shall include the equipment tag number, type, size, equipment covered, and automatic and manual remote signals initiating discharge of the units. Plan drawings shall clearly show the planned location of all fixed and wheeled extinguishers. *(EIS Section 4.11.2)*
76. Facility plans showing the proposed location of, and area covered by, each monitor, hydrant, deluge system, hose, and sprinkler, as well as piping and instrumentation diagrams, of the fire water system shall be filed **prior to initial site preparation**. *(EIS Section 4.11.2)*
77. A copy of the hazard design review and list of recommendations that are to be incorporated in the final facility design shall be filed **prior to initial site preparation**. *(EIS Section 4.11.2)*
78. NorthernStar shall develop an ERP (including evacuation) and coordinate procedures with the Coast Guard; state, county, and local emergency planning groups; fire departments; state and local law enforcement; and appropriate federal agencies. This plan shall include at a minimum:
 - a. designated contacts with state and local emergency response agencies;
 - b. scalable procedures for the prompt notification of appropriate local officials and emergency response agencies based on the level and severity of potential incidents;
 - c. procedures for notifying residents and recreational users within areas of potential hazard;
 - d. evacuation routes/methods for residents and public use areas that are within any transient hazard areas along the route of the LNG vessel transit;
 - e. locations of permanent sirens and other warning devices; and
 - f. an “emergency coordinator” on each LNG carrier to activate sirens and other warning devices.

The ERP shall be filed with the Secretary for review and written approval by the Director of OEP **prior to initial site preparation**. NorthernStar shall notify FERC staff of all planning meetings in advance and shall report progress on the development of its ERP at **3-month intervals**. *(EIS Section 4.11.6)*

79. The ERP shall include a Cost-Sharing Plan identifying the mechanisms for funding all project-specific security/emergency management costs that would be imposed on state and local agencies. In addition to the funding of direct transit-related security/emergency management costs, this comprehensive plan shall include funding mechanisms for the capital costs associated with any necessary security/emergency management equipment and personnel base. The Cost-Sharing Plan shall be filed with the Secretary for review and written approval by the Director of OEP **prior to initial site preparation**. *(EIS Section 4.11.6)*
80. The **final design** of the fixed and wheeled dry-chemical, fire extinguishing hazard control equipment shall identify manufacturer and model. *(EIS Section 4.11.2)*
81. The **final design** shall include an updated fire protection evaluation carried out in accordance with the requirements of NFPA 59A, 2001 edition, chapter 9.1.2. *(EIS Section 4.11.2)*
82. The **final design** shall include a minimum of eight permanent bench marks located equally spaced around the top of the concrete base slab for each LNG tank. *(EIS Section 4.11.2)*
83. The **final design** shall include a discretionary vent valve for each LNG tank, operable through the distributed control system. *(EIS Section 4.11.2)*
84. The **final design** shall include a shutoff valve at the suction and discharge of each high pressure LNG pump. *(EIS Section 4.11.2)*
85. The **final design** shall specify that dual temperature elements and transmitters are provided for low temperature alarm and shutdown at the discharge of each vaporizer. *(EIS Section 4.11.2)*
86. The **final design** shall include a check valve between the LNG vaporizer discharge shutoff valve and the discharge manual isolation valve. *(EIS Section 4.11.2)*
87. The **final design** shall include a pilot relief valve or operated vent valve sized for thermal relief at the discharge of the vaporizer. *(EIS Section 4.11.2)*
88. The **final design** shall include provisions for the future installation of LNG pumps for the vapor return KO out drum and the boil-off compressor suction drum. *(EIS Section 4.11.2)*
89. The **final design** shall specify that for LNG and natural gas service, branch piping and piping nipples less than 2 inches are to be no less than schedule 160. *(EIS Section 4.11.2)*
90. The **final design** shall specify that spiral wound gaskets for LNG, natural gas service, or other hydrocarbon fluid service are to be equipped with inner and outer stainless steel retaining rings. *(EIS Section 4.11.2)*
91. The **final design** shall specify that piping and equipment that may be cooled with liquid nitrogen is to be designed for liquid nitrogen temperatures, with regard to allowable movement and stresses. *(EIS Section 4.11.2)*

92. The **final design** shall specify that the wharf area switchboards are connected to the backup generator. *(EIS Section 4.11.2)*
93. The **final design** shall include details of the shutdown logic, including cause and effect matrices for alarms and shutdowns. *(EIS Section 4.11.2)*
94. The **final design** shall include ESD of equipment and systems activated by hazard detection devices for flammable gas, fire, and cryogenic spills, when applicable. *(EIS Section 4.11.2)*
95. The **final design** shall include details of the air gaps to be installed downstream of all seals or isolations installed at the interface between a flammable fluid system and an electrical conduit or wiring system. Each air gap shall vent to a safe location and be equipped with a leak detection device that: shall continuously monitor for the presence of a flammable fluid; shall alarm the hazardous condition; and shall shutdown the appropriate systems. *(EIS Section 4.11.2)*
96. The **final design** shall include a hazard and operability review of the completed design. A copy of the review and a list of the recommendations shall be filed with the Secretary. *(EIS Section 4.11.2)*
97. The **final design** shall provide up-to-date Piping & Instrument Diagrams (P&IDs) including a description of the instrumentation and control philosophy, type of instrumentation (pneumatic, electronic), use of computer technology, and control room display and operation. Drawings and all information shall be clearly legible on 11- by 17-inch paper and the piping legend and symbology shall be in accordance with accepted practice. All drawings shall be filed in black and white. The following information shall be included on the P&IDs:
- a. equipment tag number, name, size, duty, capacity and design conditions;
 - b. piping with line number, piping class specification, size and insulation;
 - c. LNG tank pipe penetration size or nozzle schedule;
 - d. piping specification breaks and insulation limits;
 - e. isolation flanges, blinds and insulating flanges;
 - f. valve type, in accordance with the piping legend symbol;
 - g. all control valves numbered;
 - h. all valve operator types and valve fail position;
 - i. instrumentation numbered;
 - j. control loops including software connections;
 - k. alarm and shutdown set points;
 - l. shutdown interlocks;
 - m. relief valves numbered, with set point;
 - n. relief valve inlet and outlet piping size;
 - o. car sealed valves and blinds;
 - p. equipment insulation;
 - q. drawing revision number and date;
 - r. all manual valves numbered, including check, vent, drain, and car sealed valves; and
 - s. alarm and shutdown set points. *(EIS Section 4.11.2)*
98. The **final design** shall specify that all hazard detection equipment shall include redundancy, fault detection and fault alarm monitoring. *(EIS Section 4.11.2)*
99. All valves including drain, vent, main, and car sealed valves shall be tagged in the field during construction and **prior to commissioning**. *(EIS Section 4.11.2)*

100. The design details and procedures to record and to prevent the tank fill rate from exceeding the maximum fill rate specified by the tank designer shall be filed **prior to commissioning**. (*EIS Section 4.11.2*)
101. A tabulated list of the proposed hand-held fire extinguishers shall be filed **prior to commissioning**. The information shall include a list with the equipment number, type, size, number, and location. Plan drawings shall include the type, size, and number of all hand-held fire extinguishers. (*EIS Section 4.11.2*)
102. Operation and Maintenance procedures and manuals, as well as safety procedure manuals, shall be filed **prior to commissioning**. (*EIS Section 4.11.2*)
103. The FERC staff shall be notified of any proposed revisions to the security plan and physical security of the facility **prior to commencement of service**. (*EIS Section 4.11.2*)
104. Progress on construction of the LNG terminal shall be reported in monthly reports filed with the Secretary. Details shall include a summary of activities, projected schedule for completion, problems encountered and remedial actions taken. Problems of significant magnitude shall be reported to the FERC **within 24 hours**. (*EIS Section 4.11.2*)
105. NorthernStar, until commencement of service, shall **annually** review its WSA relating to LNG marine traffic for the project; update the assessment to reflect changing conditions which may impact the suitability of the waterway for LNG marine traffic; provide the updated assessment to the cognizant COTP/FMSC for review and validation and if appropriate, further action by the COTP/FMSC relating to LNG marine traffic; and provide a copy to the FERC staff. (*EIS Section 4.11.5.5*)

Recommendation Numbers 106 through 110 shall apply throughout the life of the facility:

106. **Throughout the life of the facility**, NorthernStar shall ensure that the facility and any LNG vessel transiting to and from the facility comply with all requirements set forth by the Coast Guard Captain of the Port Sector Portland, including all risk mitigation measures recommended in the WSR. (*EIS Section 4.11.5.5*)
107. The facility shall be subject to regular FERC staff technical reviews and site inspections on at least an **annual basis or more frequently** as circumstances indicate. Prior to each FERC staff technical review and site inspection, NorthernStar shall respond to a specific data request including information relating to possible design and operating conditions that may have been imposed by other agencies or organizations. Up-to-date detailed piping and instrumentation diagrams reflecting facility modifications and provision of other pertinent information not included in the semi-annual reports described below, including facility events that have taken place since the previously submitted semi-annual report, shall be submitted. (*EIS Section 4.11.2*)
108. **Semi-annual** operational reports shall be filed with the Secretary to identify changes in facility design and operating conditions, abnormal operating experiences, activities (including ship arrivals, quantity and composition of imported LNG, vaporization quantities, boil-off/flash gas, etc.), plant modifications including future plans and progress thereof. Abnormalities shall include, but not be limited to: unloading/shipping problems, potential hazardous conditions from off-site vessels, storage tank stratification or rollover, geysering, storage tank pressure excursions, cold spots on the storage tanks, storage tank vibrations and/or vibrations in associated cryogenic piping, storage tank settlement, significant equipment or instrumentation malfunctions or failures, non-scheduled maintenance or repair (and reasons therefore), relative movement of storage tank

inner vessels, vapor or liquid releases, fires involving natural gas and/or from other sources, negative pressure (vacuum) within a storage tank and higher than predicted boiloff rates. Adverse weather conditions and the effect on the facility also shall be reported. Reports shall be submitted **within 45 days** after each period ending **June 30 and December 31**. In addition to the above items, a section entitled "Significant plant modifications proposed for the next 12 months (dates)" also shall be included in the semi-annual operational reports. Such information would provide the FERC staff with early notice of anticipated future construction/maintenance projects at the LNG facility. (*EIS Section 4.11.2*)

109. In the event the temperature of any region of any secondary containment, including imbedded pipe supports, becomes less than the minimum specified operating temperature for the material, the Commission shall be notified **within 24 hours** and procedures for corrective action shall be specified. (*EIS Section 4.11.2*)
110. Significant non-scheduled events, including safety-related incidents (i.e., LNG or natural gas releases, fires, explosions, mechanical failures, unusual over pressurization, and major injuries) and security related incidents (i.e., attempts to enter site, suspicious activities) shall be reported to the FERC staff. In the event an abnormality is of significant magnitude to threaten public or employee safety, cause significant property damage, or interrupt service, notification shall be made **immediately**, without unduly interfering with any necessary or appropriate emergency repair, alarm, or other emergency procedure. In all instances, notification shall be made to the Commission staff **within 24 hours**. This notification practice shall be incorporated into the LNG facility's emergency plan. Examples of reportable LNG-related incidents include:
 - a. fire;
 - b. explosion;
 - c. estimated property damage of \$50,000 or more;
 - d. death or personal injury necessitating in-patient hospitalization;
 - e. free flow of LNG that results in pooling;
 - f. unintended movement or abnormal loading by environmental causes, such as an earthquake, landslide, or flood, that impairs the serviceability, structural integrity, or reliability of an LNG facility that contains, controls, or processes gas or LNG;
 - g. any crack or other material defect that impairs the structural integrity or reliability of an LNG facility that contains, controls, or processes gas or LNG;
 - h. any malfunction or operating error that causes the pressure of a pipeline or LNG facility that contains or processes gas or LNG to rise above its maximum allowable operating pressure (or working pressure for LNG facilities) plus the build-up allowed for operation of pressure limiting or control devices;
 - i. a leak in an LNG facility that contains or processes gas or LNG that constitutes an emergency;
 - j. inner tank leakage, ineffective insulation, or frost heave that impairs the structural integrity of an LNG storage tank;
 - k. any condition that could lead to a hazard and cause a 20 percent reduction in operating pressure or shutdown of operation of a pipeline or an LNG facility;
 - l. safety-related incidents to LNG vessels occurring at or en route to and from the LNG facility; or
 - m. an event that is significant in the judgment of the operator and/or management even though it did not meet the above criteria or the guidelines set forth in an LNG facility's incident management plan.

In the event of an incident, the Director of OEP has delegated authority to take whatever steps are necessary to ensure operational reliability and to protect human life, health, property or the environment, including authority to direct the LNG facility to cease operations. Following the initial company notification, Commission staff would determine the need for an on-site inspection by Commission staff, and the timing of an initial incident report (normally within 10 days) and follow-up reports. (*EIS Section 4.11.2*)

APPENDIX G

U.S. Coast Guard Letter of Intent and Waterway
Suitability Report Letter for the Bradwood Landing
Project

NORTHERN STAR NATURAL GAS LLC

Captain Paul D. Jewell, Commanding Officer
US Coast Guard Marine Safety Office Portland
6767 North Basin Avenue
Portland, OR 97217

January 18, 2005

Dear Captain Jewell,

As required under US Title 33 Code of Federal Regulations § 127.007 (a), Northern Star Natural Gas LLC ("NSNG") herein submits a Letter of Intent to build a new Waterfront Facility Handling Liquefied Natural Gas Facility within the Portland, Oregon US Coast Guard Captain of the Port Zone. NSNG recognizes that submission of this Letter of Intent significantly predates the planned construction and start-up milestones discussed below and I feel that this early involvement of your office merits brief discussion.

The Federal Energy Regulatory Commission ("FERC") has issued Guidance¹ which provides a mechanism for National Environmental Policy Act ("NEPA") pre-filing activities. This Guidance, which provides an option for NEPA pre-filing on interstate natural gas projects, "...encourage(s) ... industry to engage in early project-development involvement with the public and agencies." NSNG will soon initiate the Pre-Filing Process encouraged under FERC Guidance and, in the spirit of that Guidance, is submitting for your consideration this Letter of Intent well ahead of the minimum timelines set forth in Subpart A of Part 127 of Title 33 CFR. In keeping with the intent of the Guidance, it is hoped that this approach serves in support of the:

- 1) initiation of an early review of the environmental documentation required under NEPA; and,
- 2) start of a stakeholder outreach program so as to promote and facilitate the early identification and resolution of issues.

It is our hope that the NEPA Pre-Filing will support the Project's receiving an expeditious review and approval, allowing for the meeting of the proposed construction schedule and targeted in-service date. We are mindful of the critical role that the Captain of the Port holds in the development of a project of this nature and look forward to working closely together with your staff as the Project matures.

Overview

NSNG proposes to construct a Liquid Natural Gas (LNG) Receiving Terminal ("Terminal") to be located in Bradwood, Oregon. The Terminal will be located on roughly 55 acres within an approximate 450 acre parcel of land, controlled by NSNG, which lies on the southern shore of the Columbia River approximately 38 miles from the

¹ Guidance: FERC Staff NEPA Pre-Filing Process For Natural Gas Projects, February 10, 2004; *Federal Energy Regulatory Commission* - (see http://www.ferc.gov/industries/gas/enviro/gas_pre-filing.pdf)

NORTHERN STAR NATURAL GAS, LLC
Bradwood, Oregon Letter of Intent

January 18, 2005

Pacific shoreline. The Terminal is planned to be built in a phased construction schedule, with 1.0 billion standard cubic feet per day (BCFD) sendout capacity in the first phase, and a provision for expansion to satisfy follow-on attendant market demand thereafter. The Terminal shall consist of the following major components:

- *Marine terminal and LNG transfer lines* – Proposed infrastructure shall include a single berth to receive LNG Tank Vessels ranging from 100,000 cubic meters (“m³”) up to 250,000 m³ (~629,000 bbls to ~1,570,000 bbls) in capacity with an unloading rate of 12,000 m³/hr (~75,700 bbls/hr). The LNG will be transferred from the Tank Vessels through three 16-inch diameter liquid unloading arms at the berth and transferred to storage tanks through dual 30-inch diameter liquid unloading lines. It is envisioned that some moderate dredging will be required to access the berth and dredge the turning basin.
- *Two LNG storage tanks* – The Proposal provides for the initial construction of two full-containment LNG storage tanks, each having a net capacity of 165,000 m³ (~1,038,000 bbls). Permitting for a third LNG storage tank will be sought with the initial application, with plans for its actual construction in the future.
- *LNG vaporization and send out system* – Proposed process equipment shall include a vaporization system. This vaporization system that may be either Shell and Tube Vaporizers equipped with water/glycol heaters or, alternately, Submerged Combustion Vaporizers fitted with In-Tank Low Pressure LNG pumps that feed High Pressure LNG booster pumps.
- *Vapor Handling System* – Proposed vapor handling equipment includes two 50% capacity cryogenic blowers to remove a portion of the vapor generated in the storage tanks during ship unloading, and two 50% capacity oil-free reciprocating compressors to discharge the balance of the vapors generated in the tank.
- *Utilities and infrastructure* – Proposed facilities infrastructure shall include, but not be limited to, roads, fences, dikes, buildings, pipe racks, utilities, power distribution system, and a fire protection system.
- *Natural Gas Sendout Pipeline* – A new 36-inch-diameter natural gas pipeline of approximately 35 miles in length will be constructed to interconnect to the Williams Northwest Pipeline system.

In addition, it is of note that associated non-jurisdictional facilities may include upgrades to short sections of public road or extensions of utilities to the site.

Title 33, Part 127, Subpart A Particulars

In addition to the physical location and description of the proposed facility discussed above, the following additional information required by 33 CFR § 127.007 (d)(1) – (d)(6) is provided.

NORTHERN STAR NATURAL GAS, LLC
Bradwood, Oregon Letter of Intent

January 18, 2005

I. General Information

The Owner and Operator of the NSNG LNG Facility is:

Mr. William "Si" Garrett
President
Northern Star Natural Gas LLC
5501 Tilbury Drive
Houston, TX 77056-2017

Mr. Garrett may be contacted at phone number 713-817-2416

The telephone number and proper physical address of the NSNG Facility will be provided at a later date and as soon as this information becomes available.

II. Liquefied Natural Gas Carrier Information

It is envisioned that NSNG will receive approximately 125 LNG Tank Vessels per year. A listing of potential LNG Tank Vessels, selected characteristics, and general trading routes is provided in Enclosure 1 to this Letter.

III. Environmental Information

This section focuses on environmentally sensitive areas from Mile 38 seaward to Mile 18. In particular, these areas include:

- *Clatsop County Net Pen Fisheries Project located at two sites, the first in Cathlamet Bay in the approximate area of Mile 19 – Mile 18, and the second in the approximate area of Mile 27 near Blind Slough. Both sites are associated with the release of Coho smolts;*
- *Lewis & Clark National Wildlife Refuge (NWR), which includes twenty-three named and charted islands adjacent to Cathlamet Bay, Calendar Slough, Brownsmead Flats, Blind Slough, and Clifton Channel, in the area of Mile 38 – Mile 20;*
- *Big Creek Fish Hatchery, in the approximate area of Mile 26, associated with the release Coho smolts;*
- *Gnat Creek Hatchery, in the approximate area of Mile 27, associated with the release of Spring Chinook and Winter Steelhead smolts;*
- *Corps Channel Improvement Project includes mitigation for dredging, Lois Island Embayment (Mile 20-Mile 18), Miller - Pillar Islands (Mile 26- Mile 25) and Tenasillahe Island (Mile 37- Mile 36) and are designated areas for restoration projects; and,*
- *The Nicholai – Wickiup Watershed, as depicted in Figure 1, which has three business entities with National Pollution Discharge Elimination System Permits (NPDES) and eight with Water Pollution Control Facility Permits (WPCF). These activities are mentioned herein because their activities have impacts to water quality and temperature affecting salmonids in the area of Mile 38 – Mile 20.*

NORTHERN STAR NATURAL GAS, LLC
Bradwood, Oregon Letter of Intent

January 18, 2005

Figure 1 Nicolai-Wickiup Watershed

IV. Residential Information

This section discusses residential areas from Mile 38 seaward to Mile 18. The area immediately surrounding the proposed site is shown in the aerial photograph presented in Figure 2. In particular, the residential areas in consideration include:

- *a very small pocket of residential zoned land at the end of the Bradwood Clifton road, at the approximate area of Mile 37 – Mile 36;*
- *a small number (approximately ten) of residential addresses in the area of Ostervold Road on Puget Island, at the approximate area of Mile 37 – Mile 36; and,*
- *Burnside, primarily a pocket of residential zoned land high on a bluff, at the approximate area of Mile 23 – Mile 22.*

With respect to Clatsop County on the “Oregon Side”, given the range of zoning that applies to cities, unincorporated rural communities, rural communities, residential zoned land, and residential uses that occur on resource land, e.g. farm and forest lands, these two areas were regarded as “residential” within the areas seaward of Mile 30.

NORTHERN STAR NATURAL GAS, LLC
Bradwood, Oregon Letter of Intent

January 18, 2005

Figure 2 Aerial Photograph of Immediate Area (top is North)

In Pacific and Wahkiakum Counties on the “Washington side”, the zoning regulations are very different from those of Oregon. Development along the north side of the Columbia River is closely stewarded by the Washington State Department of Ecology. In our area of concern of Mile 38 to Mile 20, orthophotography shows little development on the Columbia River's north side with the exception of:

- *Skamokawa, WA, which is not incorporated, but has two commercial uses and a small number of residential uses in the approximate area of Mile 34; and,*
- *A number of aged or former residential areas, characterized in some cases as “ghost towns”, reflecting old fishing villages, lumber/mill-towns, and the like. These locations are depicted as Red Dots on Enclosure 2.*

Security Issues

NSNG is particularly sensitive to the scope and nature of the security issues which must be considered by your office in the development of the Letter of Recommendation. We further recognize that efforts are currently underway by staff elements on behalf of Admiral Gilmore at US Coast Guard Headquarters (G-M) in the development of a common, cohesive approach regarding submission and review of security assessments

NORTHERN STAR NATURAL GAS, LLC
Bradwood, Oregon Letter of Intent

January 18, 2005

and risk analyses surrounding infrastructure and operations of "127 Facilities" such as herein proposed. NSNG has been in discussion with Chief, G-MSO-2 about the ongoing efforts in this regard and the predicted timing of submission of security-related materials as effects the processing of the Letter of Recommendation. We have reviewed Navigation, Vessel and Inspection Circular ("NVIC") 9-02, Change 1, in particular Enclosure 3², and suggest initiating staff discussions centered on incorporation of the general approach of the NVIC in conducting an Area/Port Security Assessment as relates to the construction and operation of the proposed facility.

Additionally, we recognize our obligation to provide a Facility Security Plan as required by Title 33 CFR §105 and look forward to working with your staff in the development and review of the Security Plan. It is envisioned that development of the Plan under §105, in conjunction with NVIC 11-02³, Change 1, and NVIC 03-03⁴ will occur later in the planning and design process as the project matures.

I look forward to answering any questions that may arise out of your Staff's review of this Letter of Intent and its supporting documentation and am eager to provide amplifying information that may be required to support your Staff's efforts in the development of the Letter of Recommendation under 33 CFR § 127.009. In this regard, I urge you or your Staff to please feel free to contact me as required.

The proposed project promises to deliver to not only the region, but the nation, much needed energy resources. I feel strongly that project maturity is in the national and public interest and that approach to the project merits consideration under Executive Order 13212. I look forward to working with you in the development of this exciting project.

Sincerely,

William "Si" Garrett, President
NORTHERN STAR NATURAL GAS LLC

MAP KEY

Refer to Chart that identifies No.1-a thru 3-a

1.		<i>Environmentally sensitive areas within the impacted area</i>
	1-a	Clatsop County Net Pen Fisheries Project (Coho smolts) located in Cathlamet Bay, (RM18 – RM19) and Blind Slough (RM27). ¹ .
	1-b	The Lewis & Clark National Wildlife Refuge (NWR) includes twenty-three named and charted islands adjacent to Cathlamet Bay, Calendar Slough, Brownsmead Flats, Blind Slough and Clifton Channel. These lands are owned by the Oregon Division of State Lands and are managed cooperatively with the Julia Butler Hansen NWR Columbia White-tailed Deer, Cathlamet, WA , the Oregon Department of Fish and Wildlife and U.S. Fish and Wildlife. ² The map depicts the Julia Butler Hansen NWR in purple. State owned forest lands, shown in teal color, are not environmentally sensitive.
	1-c	Big Creek Fish Hatchery (release Coho smolts) ³ , (RM26).
	1-d	Gnat Creek Fish Hatchery (release Spring Chinook and Winter Steelhead smolts) ⁴ , (RM27).
	1-e	Corps Channel Improvement Project includes mitigation for dredging; Lois Island Embayment (RM 18-RM20), Miller- Pillar Islands (RM25-RM26) and Tenasillahe Island (RM36-RM37) are designated areas for restoration projects. ⁵
2.		<i>All businesses/facilities positioned within the impacted area⁶</i>
	2-a	Industrial Uses include Tongue Point (The base was deactivated in January 1962, and since then the property has been divided among several different owners including non-DoD agencies of the Federal government, the Oregon Division of State Lands, and private parties), (RM 17- RM19).
	2-b	Commercial Uses
3.		<i>All incorporated towns within the impacted area⁷</i>
	3-a	Skamokowa, WA, not incorporated but has 2 commercial uses and a handful of clustered residential uses, (RM 34).
	Red Dots	The map depicts names of towns shown as red dots along the river. With the exception of unincorporated Skamokowa, these red dots are not significantly developed areas. They are mostly remnants of old fishing villages or lumber mill-towns, e.g. ghost towns.

WATERWAY SUITABILITY REPORT FOR BRADWOOD LANDING LNG

Dear Mr. Hoffmann:

On February 28, 2007, the Coast Guard completed a review of the Waterway Suitability Assessment for the Bradwood Landing LNG Terminal project submitted by Northern Star Natural Gas, LLC in May of 2006. This review was conducted following the guidance provided in Navigation and Vessel Inspection Circular (NVIC) 05-05 of June 14, 2005. The review focused on the navigation safety and maritime security risks posed by LNG marine traffic, and the measures needed to responsibly manage these risks. During the review, the Coast Guard consulted a variety of stakeholders including state and local emergency responders, Marine Pilots, towing industry representatives, members of the Port Waterway Safety Committee, and the Area Maritime Security Committee.

Based upon this review, I have determined that to make the Columbia River suitable for the type and frequency of LNG marine traffic associated with this project, additional measures will be necessary to responsibly manage the navigation, safety and security risks. The specific measures, and the resources needed to implement them where applicable, are described below and in a separate supplementary report which is being provided to you under the terms and conditions established for handling Sensitive Security Information. This supplemental report also includes a copy of the Bradwood Landing LNG Waterway Suitability Assessment. This determination is preliminary because the required NEPA analysis has not yet been completed.

The following is a list of specific risk mitigation measures that must be put into place to responsibly manage the safety and security risks of this project. Details of each measure, including adequate support infrastructure, will need to be further developed through the creation of an Emergency Response Plan as well as a Transit Management Plan that clearly spell out the roles, responsibilities, and specific procedures for the LNG vessel and all agencies responsible for security and safety during the operation.

Navigation Measures:

- Safety/Security Zone A moving safety/security zone shall be established around the LNG vessel extending 500-yards around the vessel but ending at the shoreline. No vessel may enter the safety/security zone without first obtaining permission from the Coast Guard Captain of the Port (COTP). (The expectation is that the COTP's Representative will work with the Pilots and patrol assets to control traffic, and will routinely allow vessels to transit the Safety/Security zone based on a case-by-case assessment conducted on scene. Escort resources will be used to contact and control vessel movements such that the LNG Carrier is protected.)

February 28, 2007

While the vessel is moored at the facility there shall be a 200 yard-security zone around the vessel. In addition, there will be a 50 yard security zone around the LNG Terminal when there is not a vessel at the dock.

Resource Gap: Resources required to enforce the safety/security zone are discussed under Security Measures in the supplemental report.

- Vessel Traffic Management Due to a narrow shipping channel, numerous navigational hazards, and the proximity to populated areas, LNG vessels will be required to meet the following additional traffic management measures:
 - A Transit Management Plan will be developed in coordination with River Pilots, Bar Pilots, Escort Tug Operators, Security Assets and the Coast Guard prior to the first transit.
 - This plan will be reviewed within six months of the initial arrival, and followed by an annual review to ensure that it reflects the most current conditions and procedures.
 - For at least the first six months, there will be at least 2 Pilots throughout the transit.
 - For at least the first six months, all transits will be daylight only, unless approved in advance by the COTP.
 - The LNG Vessel must board Pilots at least 5 miles before the CR Buoy.
 - Overtaking by or of the LNG Vessel is prohibited without COTP approval.
 - Meetings situations of commercial vessels will be closely controlled. All meetings must be pre-arranged via Channel 13 VHF Bridge-to-Bridge and will be limited to the following areas:
 - From the CR buoy to Tongue Point, with the exception that commercial vessels shall avoid meeting in all turns, and between buoys 22 and 29, and buoy 33 and 42,
 - Vessels may arrange meetings from Tongue Point to Rice Island between buoy 42 and 54,
 - Altoona to Pillar Rock Miller Sands Light #11 to Light # 17,
 - Price Island to Puget Island between buoy 32 and Bradwood.
 - 24 hours prior to arrival, the Coast Guard, FBI, Bar Pilots and River Pilots, Escort Tug Masters, and other Escort assets will meet to coordinate inbound and outbound transit details
 - Vessel transits and bar crossings will be coordinated so as to minimize conflicts with other deep draft vessels, recreational boaters, seasonal fisheries, and other Marine Events

Resource Gaps: The Vessel Transit Management Plan must be approved by the COTP at least 30 days prior to the first arrival.

- Vessel Traffic Information System / Vessel Traffic System The current Vessel Traffic Information System on the Columbia River is limited to AIS receivers and a handful of cameras. In order to ensure vessel safety and security, this capability will need to be augmented with a robust camera system capable of monitoring the entire transit route. Due to weather concerns, these cameras must be equipped with detectors capable of monitoring vessel traffic in wind, rain and fog conditions common on the river. In addition this capability may need to be augmented in the future with additional command and control capability and the establishment of a full Columbia River VTS.

Resource Gaps: Camera system with complete coverage of the entire transit route, capable of detecting vessel traffic in wind, rain, fog, and dark conditions. An additional AIS repeater

February 28, 2007

located in Astoria is also required to provide complete coverage of the Lower Columbia. If implemented, a fully staffed VTS would require at least 2 watch standers and a supervisor or 20 personnel to maintain round-the-clock coverage.

- Tug Escort and Docking Assist Due to the confined channel and high wind conditions, each LNG Carrier must be escorted by two tugs; at least one of which must be a tractor tug, which will join the vessel as soon as safe to do so. The primary tug will be tethered at the direction of the pilot. A third tug will be required to assist with turning and mooring.

All three tugs will be at least 60 Ton Astern Bollard Pull or larger and equipped with Class 1 Fire Fighting equipment. Based on the Maneuvering Simulation Study of November 4, 2005, vessels over 140,000 m³ will be limited to transiting during periods of 25 knots of wind or less. Additionally, extreme wind and weather conditions may require a third tug escort tug for any LNG vessel. While unloading, all three tugs will remain on standby to assist with emergency departure procedures.

Resource Gaps: Three 60 Bollard Ton Tractor Tugs with Class 1 Fire Fighting capability.

- Navigational Aids Buoys or Daymarks will be required:
 - Three Aids at Bradwood, outlined in Figure 3, on p. 8 of the Vessel Maneuvering Simulation Study of November 4, 2005.
 - Range on Upper and Lower Desdemona Reach
 - PORTS (Physical Oceanographic Real-Time System) station at Bradwood contracted with NOAA to provide real time river level, current and WX data
 - Doppler docking station similar to the one found in Savannah River
- LNG Carrier familiarization training for Pilots and Tug Operators Prior to the arrival of the first vessel, simulator training will be required for Pilots and Tug Operators identified as having responsibility for LNG traffic.
- Dynamic Under Keel Clearance System Installation of a real time system for data collection on bar conditions is strongly recommended as increasing the ability to safely navigate the Columbia River Bar during marginal conditions. The lack of accurate data, will limit the conditions under which a vessel may safely transit the bar. An immersion study of deep draft LNG vessels transiting the bar during summer and winter conditions is required within the first 12 months.

Resource Gap: Actual data on LNG tanker immersion.

Safety Measures:

- Vessel and Facility Inspections LNG tankers and facilities are subject to (at a minimum) annual Coast Guard inspections to ensure compliance with federal and international safety, security and pollution regulations. In addition, LNG vessels and facilities are typically required to undergo a pre-arrival inspection, and transfer monitor.

Resource Gap: Additional Coast Guard Facility and Vessel Inspectors.

- Shore-Side Fire-Fighting Firefighting capability is extremely limited along the entire transit route. Shore side firefighting resources and training will need to be augmented in order to provide basic protection services to the facility as well as the communities along the transit route.

Resource Gap: To be determined in conjunction with local and regional response agencies through the Emergency Response Planning process. Prior to the approval of the Emergency Response Plan, adequate cost sharing arrangements for project related training, equipment, maintenance, and staffing will need to be addressed for all of the communities impacted by the project.

- In-Transit Fire-Fighting Significant resource and jurisdictional issues exist in any marine fire incident on an underway vessel in the Columbia River. Current planning and preparedness efforts focus on a shore based response to a vessel moored at a facility.

Resource Gap: Development of a concrete plan for managing underway firefighting, including provisions for command and control of tactical fire fighting decisions as well as financial arrangements for provision of mutual aid and identification of suitable locations for conducting fire fighting operations is critical to ensuring the safety of the port and securing the waterway.

- Public Notification System and Procedures Adequate means to notify the public along the transit route, including ongoing public education campaigns, emergency notification systems (such as reverse 911 and siren systems), and adequate drills and training are required. Education programs must be tailored to meet the various needs of all river users, including commercial and recreational boaters, local businesses, local residents, and tourists.

Resource Gap: Current public notification capabilities vary greatly, and as part of the Emergency Response Planning process, a comprehensive notification system, including the deployment of associate equipment and training, will need to be developed.

- Gas Detection Capability With the exception of the HAZMAT team in Astoria, gas detection capability is not resident and may not be available to initial responders along the transit route and at the facility. Emergency response personnel (both Police and Fire) require appropriate gas detection equipment, maintenance, and training.

Resource Gap: Gas Detectors, appropriate training, and maintenance infrastructure.

- Communication Systems and Protocols Inter-agency communication pose a significant obstacle to joint operations. Deployment of a Regional Communication Plan and associated equipment is required to ensure that the facility, associated command centers, emergency responders, Coast Guard, Tug Operators, Escort Vessels, and Pilots can communicate in an effective manner. The system must provide for monitoring and communicating on both secure and unsecure (eg Ch. 16, 13, 22), as well as sending and receiving both speech and data.

Resource Gap: Operation specific and contingency communications plans and appropriate (intrinsically safe) equipment to coordinate both routine escorts and emergency operations. Equipment to transmit and receive both voice and data in a secure and unsecure environment.

February 28, 2007

Security Measures:

- Security Boardings, Waterway Monitoring, Shoreline Patrols, and Vessel Escorts Extensive security measures will be required to provide adequate protection for LNG vessel while transiting the Columbia River and moored at the facility. The details of these measures are Sensitive Security Information, and are outlined in a separate supplementary report.
- Additional Measure While A Cruise Ship is in Port While cruise ships are moored or anchored at the Port of Astoria, LNG vessels will be restricted to transiting in good visibility (6 miles or more). In addition, any cruise ship will also require separate waterside security, during the LNG Transit. Finally a Cruise Ship and LNG Carrier shall not be placed in a meeting situation.

Resource gap: Sufficient Coast Guard or local law enforcement assets to provide adequate and independent security for both vessels.

- Facility Security Measures LNG facilities are subject to the security regulations outlined in 33 CFR 105, and are required to submit a Facility Security Plan (FSP) for Coast Guard approval, and undergo (at a minimum) an annual Coast Guard security inspection. The facility shall also develop a plan to provide for appropriate security measures from the start of construction through implementation of the Coast Guard approved FSP.
- Sandia Study The WSA proposes to receive vessels with up to 200,000 m³ cargo capacity. The Sandia Report is based on consequences of LNG breaches, spills and hazards associated with LNG vessels having a cargo capacity no greater than 148,000 m³ and spill volumes of 12,500 m³. There remains some question as to the size of hazard zones for accidental and intentional discharges and the potential increased risk to public safety from LNG spills on water for larger vessels. Based on these existing uncertainties, Northern Star must either complete a site-specific analysis for the largest sized LNG vessel or limit arrivals to vessels with a cargo capacity no greater than 148,000 m³ until additional analysis addressing vessels with higher cargo capacities is completed.

In the absence of the measures described in this letter and the resources necessary to implement them, or in the absence of any changes to existing Coast Guard policy or guidance to lessen safety and security requirements, the Columbia River would be considered unsuitable for the LNG marine traffic associated with the Bradwood LNG terminal. Due to the dynamic nature of the Columbia River, the applicant shall be required to submit an annual update to the Waterway Suitability Assessment to the Coast Guard which shall be revalidated by the COTP and AMSC. For further information, please contact LT Shadrack Scheirman of Coast Guard Sector Portland at (503) 240-9307.

Sincerely,

Patrick G. Gerrity
Captain, U.S. Coast Guard
Captain of the Port
Federal Maritime Security Coordinator

APPENDIX J

RESPONSE OF THE FEDERAL ENERGY REGULATORY COMMISSION TO THE SAFETY ADVISORY REPORT OF THE OREGON DEPARTMENT OF ENERGY FOR THE BRADWOOD LANDING PROJECT

1.0 INTRODUCTION

The Natural Gas Act (NGA), as modified by the Energy Policy Act of 2005 (EPAAct), requires that the Federal Energy Regulatory Commission (FERC or the Commission) consult with the state in which a liquefied natural gas (LNG) terminal is proposed to be located regarding state and local safety matters. The governor of Oregon designated the Oregon Department of Energy (ODE) as the state agency that the FERC should consult with on safety and siting matters for the Bradwood Landing Project.

On July 6, 2006, the ODE submitted its Safety Advisory Report to the FERC. In the report, ODE addressed state and local considerations for the project and provided comments from the Columbia River Estuary Study Taskforce (CREST), a council of governments that includes the local counties, cities, and port districts surrounding the Columbia River Estuary in both Oregon and Washington. The Safety Advisory Report also includes the comments received directly from local governmental entities (Clatsop County and the Cities of Astoria and Warrenton).

The EPAAct also stipulates that before the Commission may issue an order authorizing an LNG terminal, it must “review and respond specifically” to the safety matters raised by the state agency designated as the lead for the state and local safety matters. Table 2-1 of this appendix provides the FERC’s response to the ODE Safety Advisory Report for the Bradwood Landing Project.

Section 3.0 contains the Safety Advisory Report including attached comment letters from CREST, Clatsop County, Astoria, and Warrenton. Only safety-related issues raised in the comment letter are addressed in this appendix.

2.0 FERC RESPONSE TO THE ADVISORY REPORT

The ODE identified the following key categories of potential safety concerns in the Safety Advisory Report:

- Emergency Planning and Response;
- Security Zone;
- Terminal Design;
- Hazard Identification;
- Quality Assurance;
- Safety Issues; and
- Emergency Response Capabilities near the Facility Location.

The Safety Advisory Report included both general and specific safety matters that ODE requested be included in the FERC’s review of the NorthernStar application. The FERC’s specific responses to those concerns are presented in Table 2-1 in the order of the issues presented in the report. Where appropriate, the response identifies the section of the EIS where information on the issue of concern is addressed.

As described in sections 1.0 and 2.0 of the EIS, the U.S. Coast Guard (Coast Guard) has shared responsibility with FERC in reviewing the Bradwood Landing Project and has summarized portions of its review in its Waterway Suitability Report (WSR). In addition to including the complete WSR in the EIS (see Appendix N), we have summarized portions of it in the EIS. As a result, for some concerns presented in the Safety Advisory Report, we have noted that the issue is addressed in the WSR, as well as the specific section of the EIS where the concern is addressed.

TABLE 2-1

The FERC's Responses to Concerns Presented in the ODE Safety Advisory Report for the Bradwood Landing Project

Commentor/Topic	Issue	Response ^a
ODE		
Emergency Planning and Response	<p>The applicant has not accurately or adequately characterized the areas' emergency response capabilities in its WSA.</p> <p>The FERC should consider the issues and safety concerns raised by stakeholders and the safety of the communities along the shipping route on the Columbia River.</p> <p>The FERC should require an applicant to commit to covering 100 percent of the safety and security costs directly associated with the LNG vessel transits, the facility, and the pipeline, including all infrastructure, planning, training, and other associated costs identified in an emergency response plan agreed to by the state and local jurisdictions, or the FERC should explain its authority for imposing such costs on local jurisdictions and the state.</p> <p>The safety/security zones proposed for the vessel in transit and the vessel at dock must be sufficiently calculated and justified. The applicant or the Coast Guard must thoroughly explain any changes to those zones that might accompany heightened national security as well as any resulting impacts.</p> <p>The FERC should require the applicant to complete an acceptable emergency response plan prior to any Commission decision on its application and in conjunction with the Coast Guard's validation of the WSA.</p>	<p>The emergency response capabilities of the local areas are discussed in sections 4.8.1.6 and 4.8.2.6 and the WSR (see Appendix N).</p> <p>Stakeholder issues and concerns are addressed throughout section 4.11.</p> <p>We included a recommendation that the Emergency Response Plan include a Cost-Sharing Plan identifying the mechanisms for funding all project-specific security/emergency management costs that would be imposed on state and local agencies (see section 4.11.7).</p> <p>See section 4.11.5.5 and the WSR in Appendix N.</p> <p>In accordance with the EP Act, we included a recommendation in section 4.11.7 that NorthernStar develop an Emergency Response Plan (including evacuation) and coordinate procedures with the Coast Guard; state, county, and local emergency planning groups; fire departments; state and local law enforcement; and appropriate federal agencies, and that the Emergency Response Plan should be filed with the Secretary of the Commission (Secretary) for review and written approval by the Director of Office of Energy Projects (OEP) prior to initial site preparation (also see the WSR in Appendix N).</p> <p>We included a recommendation in section 4.11.7 that NorthernStar develop an Emergency Response Plan (including evacuation) and coordinate procedures with the Coast Guard; state, county, and local emergency planning groups; fire departments; state and local law enforcement; and appropriate federal agencies.</p> <p>This will be addressed during the preparation of the Emergency Response Plan which must be filed with the Secretary for review and written approval by the Director of OEP prior to initial site preparation. See section 4.11.7</p> <p>See above.</p>
	<p>The applicant's Emergency Response Plan must be developed in full cooperation with state and local authorities, including authorities from Washington State.</p> <p>The applicant's Emergency Response Plan must sufficiently and accurately characterize the emergency response capabilities along the vessel transit route and near the facility, including response times and must include measures to mitigate for any safety gaps.</p> <p>The applicant's Emergency Response Plan must include all potentially affected communities along the LNG vessel route and near the terminal in a comprehensive, thoroughly publicized warning system.</p>	

TABLE 2-1 (cont'd)

The FERC's Responses to Concerns Presented in the ODE Safety Advisory Report for the Bradwood Landing Project		Response ^a
Commentor/Topic	Issue	
	The applicant's Emergency Response Plan must account for potential population increases due to tourism. Any FERC authorization for an LNG terminal and associated pipeline in Oregon must fully comply with Oregon state and local laws and regulations, including energy facility siting laws.	See above. As a matter of foreign commerce, the importation of LNG is subject to federal, not state, control. Although the Commission has exclusive jurisdiction over the proposed project, certain permits, approvals, and licenses are the responsibility of other federal agencies and state and local authorities. The Commission encourages cooperation between project applicants and these agencies. However, any state or local permits issued with respect to the jurisdictional facilities authorized by the Commission must be consistent with the conditions of the approving Order. The tanks will be constructed of 9 percent nickel steel. See section 11.4 for an in-depth discussion.
Terminal Design	Resource Report 1 states that the primary storage tank may be constructed of either 9percent nickel steel or, alternately, pre-stressed concrete. While either construction method is allowed by the National Fire Protection Association (NFPA) 59A, the FERC should require that the safer option be selected. The ODE expects the FERC to perform a detailed design review to verify compliance with NFPA 59A and the codes referenced in Resource Reports 1, 11, and 13.	The proposed facilities must meet the federal safety standards prescribed by Title 49 Code of Federal Regulations (CFR), Part 193 including applicable portions of the NFPA 59A (2001) standard, as adopted by reference. During construction, facilities are inspected by the Department of Transportation (DOT) to ensure compliance. In addition, the facilities would be required to comply with the FERC staff's recommendations made as a result of the cryogenic design and technical review. See section 4.11. The FERC will gladly accept and address any future comments.
Hazard Identification	The ODE requests the opportunity to comment on design issues as more time and more information become available. The FERC should verify that NorthernStar chose the most conservative assumptions regarding break size, meteorological conditions, and accident scenario for all calculations used to determine the thermal radiation and vapor dispersion from the design basis spill. NorthernStar should use a non-mechanistic double ended ("guillotine") break with all pumps running for calculation purposes unless it can demonstrate that either a smaller break is more conservative or the guillotine break in this circumstance is not credible. Verify that intentional spills were assumed. The thermal radiation maps and vapor dispersion maps should be shown centered at the location closest to an affected population (in this case, the dock). For the Bradwood Landing site, the nearest affected population is most likely the residences on Puget Island.	The FERC staff has performed its own thermal radiation and vapor dispersion modeling and agrees with the conditions NorthernStar selected. See section 4.11.4. The design spills used in the thermal radiation and flammable vapor dispersion calculations are in accordance with 46 CFR 193. See above. See Vapor Dispersion and Thermal Radiation maps in section 4.11.4.

TABLE 2-1 (cont'd)

The FERC's Responses to Concerns Presented in the ODE Safety Advisory Report for the Bradwood Landing Project		
Commentor/Topic	Issue	Response ^a
	The FERC should verify that conservative assumptions were used in NFPA 59A required calculations. The EIS should include an explanation of how these assumptions were made and why they are the most conservative.	Conservative assumptions were made during calculations in sections 4.11.4 and 4.11.5.3. The exclusion zone analysis performed for the onshore facilities was in accordance with 49 CFR 193. The meteorological conditions used yielded the largest thermal and vapor exclusion zones. For marine calculations, the FERC staff used the full range of hull breaches identified in the 2004 Sandia report. In areas of uncertainty due to the lack of large-scale field data, the FERC staff used conservative assumptions (i.e., resulting in longer hazard distances) in the marine spill modeling. These conservative assumptions concern: calculation of the pool spread; determination of the pool fire flame height; and use of a higher surface emissive power. Our results have been in agreement with the Sandia guidance zones of concern, and support the conservative nature of the calculations.
Quality Assurance	<p>Provide a sample quality assurance program from a previous project for state and public review. The sample quality assurance program should include evidence that the quality assurance function is independent of operations, scheduling, or budgeting. The program should include steps to ensure that:</p> <ul style="list-style-type: none"> a. metal components are fabricated of metals with the specified metallurgical content and properties; b. concrete or other structural materials are tested to the strength specified; c. vendors of equipment and material are audited by qualified auditors; d. nondestructive tests are observed and approved by independent, quality control personnel; e. personnel performing safety related construction or operation activities are properly qualified, with documentation of that qualification available for audit; f. construction and operations are performed in accordance with approved procedures; g. only controlled copies of design documents are used in construction, with only the current revision used in the field; h. all changes in design documents are carried forward to other related and associated design documents; i. measurements are made with equipment that is calibrated and traceable; and j. conditions adverse to quality are subject to a corrective actions program that results in actions to prevent recurrence. 	<p>Quality assurance and control programs to monitor material selection, equipment fabrication, and installation would be provided by the Engineering, Procurement, and Construction (EPC) contractor selected by the project applicant if the project is authorized. In addition, the applicant would also have a similar program to provide oversight of the EPC. The FERC staff would review these programs during the periodic construction inspections occurring prior to a facility entering service.</p>

TABLE 2-1 (cont'd)

The FERC's Responses to Concerns Presented in the ODE Safety Advisory Report for the Bradwood Landing Project		
Commentor/Topic	Issue	Response ^a
Safety Issues	Resource Report 5 describes an area of relatively low population density with most of the affected houses on Puget Island in Washington State. The description of the affected area should take into account the fact that the City of Astoria is a growing community with increasing tourism largely concentrated along the shoreline.	Section 4.8.1 notes that the City of Astoria, located adjacent to the waterway, is a growing community with increasing tourism and a high population density along the shoreline.
	Resource Report 5 uses the entire county to characterize population density. The resource report fails to adjust for the fact that most of that population is along the shoreline, quite close to the river channel; therefore, the potentially affected population is actually much higher in density than implied in the application. The report also does not account for the fact that during parts of tourist season, the population can more than double.	Section 4.8.1 notes that within individual counties, population density is generally higher along the shoreline of the Columbia River. In addition, during parts of the tourist season, population in some areas can more than double.
	Roads during particularly busy summer weekends frequently back up, which would be a concern in the unlikely event that an evacuation might become necessary.	This will be addressed during the preparation of the Emergency Response Plan which must be filed with the Secretary for review and written approval by the Director of Office of OEP prior to initial site preparation. See section 4.11.7
	The ODE has reviewed the Safety Advisory Report on the proposed LNG terminal at the Port of Long Beach issued by the California Energy Commission (CEC) that relies largely on material taken from two readily available reports: (1) the Sandia Labs' November 2004 report "Guidance on Risk Analysis and Safety Implications of a Large LNG Spill Over Water" (Sandia Report) and (2) Richard Clark's "LNG Facilities in Urban Areas." The ODE agrees that the 5 kw/m ² described in the Sandia Report is "the permissible level for emergency operations lasting several minutes with appropriate clothing" (Table 6, p.38). This is the lowest heat flux shown in the thermal radiation maps provided in Attachment 11A. Because the people occupying the nearest residences to the Bradwood Landing Project (those on Puget Island) are relatively far from the nearest fire station and do not have the appropriate clothing or emergency training, thermal radiation calculations should show the point at which worst case heat flux will permit safe evacuation, possibly requiring more than "several minutes" and without appropriate clothing or emergency training. The CEC advisory report at p. 15 suggests 1.5 kw/m ² . NorthernStar should calculate the distance to this heat flux for a design basis event at Bradwood Landing and issue a figure showing the results. NorthernStar should calculate this distance not from the tanks but from the point on the facility nearest the affected properties (presumably the dock).	As identified in section 4.11.4, the incident flux levels that are used to define thermal exclusion zones for the onshore facilities were developed by the DOT through its rulemaking process, starting with the Advance Notice of Proposed Rulemaking (Notice No. 77-4, Docket No. OPO-46), and determined to be appropriate after evaluating comments in the regulatory review process. We believe this process supports the use of these incident flux levels for their intended purpose. These incident heat fluxes are also used to define the thermal exclusion zones in NFPA 59A which have been incorporated into the DOT standards in 49 CFR 193. The same incident flux levels are applied in section 4.11.5.3 to describe transient hazard areas for LNG spills on water.

TABLE 2-1 (cont'd)

The FERC's Responses to Concerns Presented in the ODE Safety Advisory Report for the Bradwood Landing Project		Response ^a
Commentor/Topic	Issue	
Emergency Response Capabilities near the Facility Location	Information included in the WSA regarding measures to protect the public during a design basis event should be a part of public outreach and should be made available before the issuance of a FERC construction permit.	The WSA has been designated Sensitive Security Information as defined in 49 CFR 1520. Because any unauthorized disclosure of details of these measures could be employed to circumvent the proposed security measures, it is not releasable to the public. However, information in the Emergency Response Plan pertaining to items, such as off-site emergency response and procedures for public notification and evacuation, would be subject to public disclosure.
	The communities along the Oregon and Washington shore are correctly characterized in the resource reports as primarily rural communities without extensive police, fire, and emergency medical organizations. If the hazards assessment in the WSA shows that additional resources are necessary in these communities to respond to a design basis emergency, the communities can only get these resources if NorthernStar funds them.	We included a recommendation that the Emergency Response Plan include a Cost-Sharing Plan identifying the mechanisms for funding all project-specific security/emergency management costs that would be imposed on state and local agencies (see section 4.11.7 and the WSR in Appendix N).
Clatsop County		
Emergency Planning and Response	Requests that FERC require the applicant to fund 100 percent of the costs related to public safety response associated with construction and operation of the Bradwood Landing facilities. Involve local first responders in the development of the WSA.	See above.
		NorthernStar submitted its WSA to the Coast Guard in May 2006. The Coast Guard reviewed the WSA and consulted with the Area Maritime Security Committee, local law enforcement, and emergency response organizations in preparing its WSR (see section 4.11.5.5 and the WSR in Appendix N).
CREST		
Emergency Planning and Response	Include provisions for adequate police and fire protection for the site to be funded by the applicant.	We included a recommendation that the Emergency Response Plan include a Cost-Sharing Plan identifying the mechanisms for funding all project-specific security/emergency management costs that would be imposed on state and local agencies (see section 4.11.7 and the WSR in Appendix N).
City of Astoria		
Emergency Planning and Response	The City of Astoria has no marine law enforcement, little marine firefighting capability, and limited public safety resources, and a significant portion of the City geography is within the zones of concern.	We included recommendations in section 4.11.7 that NorthernStar develop an Emergency Response Plan (including evacuation) and coordinate procedures with the Coast Guard; state, county, and local emergency planning groups; fire departments; state and local law enforcement; and appropriate federal agencies; and that the Emergency Response Plan include a Cost-Sharing Plan identifying the mechanisms for funding all project-specific security/emergency management costs that would be imposed on state and local agencies (see section 4.11.7 and the WSR in Appendix N).

TABLE 2-1 (cont'd)

The FERC's Responses to Concerns Presented in the ODE Safety Advisory Report for the Bradwood Landing Project	
Commentor/Topic	Response ^a
Requests continued coordination with the City regarding development of the Emergency Response Plan and WSA.	We included a recommendation that NorthernStar develop an Emergency Response Plan in coordination with the Coast Guard; state, county, and local emergency planning groups; fire departments; state and local law enforcement; and appropriate federal agencies (see section 4.11.7 and the WSR in Appendix N). NorthernStar submitted its WSA in May 2006 (see section 4.11.5.5 and the WSR in Appendix N).
Vessel transit operational procedures and the Emergency Response Plan need to address safety concerns along the vessel transit route.	We included a recommendation that NorthernStar develop an Emergency Response Plan in coordination with the Coast Guard; state, county, and local emergency planning groups; fire departments; state and local law enforcement; and appropriate federal agencies that includes among others, the requirements including procedures for notifying residents and recreational users within areas of potential hazard, and evacuation routes/methods for residents and public use areas that are within any transient hazard areas along the route of the LNG marine transit (see section 4.11.7 and the WSR in Appendix N).
The FERC or Coast Guard should require at least two dedicated tug boats with firefighting capabilities including deluge system or water curtain to protect tug operators. Tugs should be able to pull a disabled LNG carrier.	The Coast Guard would require two tugs to escort the LNG ships upriver, at least one of which must be a tractor tug, which would be made up as soon as it is safe to do so. The primary tug would be tethered at the direction of the Pilot. A third tug would be required to assist with turning and mooring (see section 4.11.5.4 and the WSR in Appendix N).
Recommends at least two Columbia Bar Pilots be on the LNG tanker ships at all times between the sea buoy, along the Astoria coast, and through the city jurisdictional limits.	The Coast Guard would require that LNG vessels must board a Pilot(s) at least 5 miles before the CR Buoy, and for at least the first 6 months, at least two Pilots must be present throughout the transit (see section 4.11.5.5 and the WSR in Appendix N).
The City does not currently have marine law enforcement assets which will be needed to supplement the Coast Guard escorts, especially within the City's jurisdictional waters.	We included a recommendation that the Emergency Response Plan include a Cost-Sharing Plan identifying the mechanisms for funding all project-specific security/emergency management costs that would be imposed on state and local agencies (see section 4.11.7 and the WSR in Appendix N).
Require the applicant to fund LNG emergency response training similar to that offered by Texas Engineering Extension Service (a member of Texas A&M System) and compensate fulltime and volunteer firefighters to attend training. A fireboat would be needed to provide adequate protection for waterfront properties.	See above.
The City of Astoria expects to be fully compensated for the additional costs associated with added police, fire and emergency response personnel and equipment needed during LNG transit.	See above.

TABLE 2-1 (cont'd)

The FERC's Responses to Concerns Presented in the ODE Safety Advisory Report for the Bradwood Landing Project		Response ^a
Commentor/Topic	Issue	
City of Warrenton Emergency Planning and Response	The City of Warrenton has no marine law enforcement, little marine firefighting capability, and limited public safety resources, and a significant portion of the city geography is within the zones of concern.	We included recommendations in section 4.11.7 that NorthernStar develop an Emergency Response Plan (including evacuation) and coordinate procedures with the Coast Guard; state, county, and local emergency planning groups; fire departments; state and local law enforcement; and appropriate federal agencies; and that the Emergency Response Plan include a Cost-Sharing Plan identifying the mechanisms for funding all project-specific security/emergency management costs that would be imposed on state and local agencies (see section 4.11.7 and the WSR in Appendix N).
	Requests continued coordination with the City regarding development of the Emergency Response Plan and WSA.	We included a recommendation that NorthernStar develop an Emergency Response Plan in coordination with the Coast Guard; state, county, and local emergency planning groups; fire departments; state and local law enforcement; and appropriate federal agencies (see section 4.11.7 and the WSR in Appendix N). NorthernStar submitted its WSA in May 2006 (see section 4.11.5.5 and the WSR in Appendix N).
	Vessel transit operational procedures and the Emergency Response Plan need to address safety concerns along the vessel transit route.	We included a recommendation that NorthernStar develop an Emergency Response Plan in coordination with the Coast Guard; state, county, and local emergency planning groups; fire departments; state and local law enforcement; and appropriate federal agencies that includes among others, the requirements including procedures for notifying residents and recreational users within areas of potential hazard, and evacuation routes/methods for residents and public use areas that are within any transient hazard areas along the route of the LNG marine transit (see section 4.11.7 and the WSR in Appendix N).
	The FERC or Coast Guard should require at least two dedicated tug boats with firefighting capabilities including deluge system or water curtain to protect tug operators. Tugs should be able to pull a disabled LNG carrier.	The Coast Guard would require two tugs to escort the LNG ships upriver, at least one of which must be a tractor tug, which would be made up as soon as it is safe to do so. The primary tug would be tethered at the direction of the Pilot. A third tug would be required to assist with turning and mooring (see section 4.11.5.4 and the WSR in Appendix N).
	Recommends at least two Columbia Bar Pilots be on the LNG tanker ships at all times between the sea buoy, along the Astoria coast, and through the city jurisdictional limits.	The Coast Guard would require that LNG vessels must board a Pilot(s) at least 5 miles before the CR Buoy, and for at least the first 6 months, at least two Pilots must be present throughout the transit (see section 4.11.5.5 and the WSR in Appendix N).
	The City does not currently have marine law enforcement assets which will be needed to supplement the Coast Guard escorts, especially within the City's jurisdictional waters.	We included a recommendation that the Emergency Response Plan include a Cost-Sharing Plan identifying the mechanisms for funding all project-specific security/emergency management costs that would be imposed on state and local agencies (see section 4.11.7 and the WSR in Appendix N).

TABLE 2-1 (cont'd)

The FERC's Responses to Concerns Presented in the ODE Safety Advisory Report for the Bradwood Landing Project

Commentor/Topic	Issue	Response ^a
	Require the applicant to fund LNG emergency response training similar to that offered by Texas Engineering Extension Service (a member of Texas A and M) and compensate fulltime and volunteer firefighters to attend training. A fireboat would be needed to provide adequate protection for waterfront properties.	See above.
	The City of Warrenton expects to be fully compensated for the additional costs associated with added police, fire and emergency response personnel and equipment needed during LNG transit.	See above.

^a Sections listed are the relevant sections of the Environmental Impact Statement for the Bradwood Landing Project.

**3.0 SAFETY ADVISORY REPORT ON THE PROPOSED BRADWOOD LANDING
LIQUIFIED NATURAL GAS TERMINAL AT RIVER MILE 38 ON THE COLUMBIA
RIVER, JULY 6, 2006**

Oregon

Theodore R. Kulongoski, Governor

OREGON
DEPARTMENT OF
ENERGY

VIA Electronic Filing

July 6, 2006

The Honorable Magalie Roman Salas
Secretary
Federal Energy Regulatory Commission
888 First Street, N.E.
Washington, D.C. 20426

Re: Bradwood Landing LLC LNG Import Project, Docket No. CPO6-365-000, CP06-366-000,
CP06-376-000, CP06-377-000

Dear Ms. Salas:

On June 5, 2006, Bradwood Landing LLC filed an application for construction of a terminal for importation of liquefied natural gas (LNG) to be located at about River Mile 38 on the Columbia River in Oregon. Bradwood Landing also filed an application for an associated pipeline to run 36 miles from the proposed site, under the Columbia River and into Washington state. The Energy Policy Act of 2005, enacted on August 8, 2005, specifies in Section 311(d) that the Governor of a state where a proposed LNG terminal would be located shall designate a state agency to consult with the Federal Energy Regulatory Commission regarding applications and that this state agency may prepare a safety advisory report that addresses state and local safety considerations. This provision in the Energy bill appears to be specific to the terminal and not to any associated pipeline. The report is due 30 days from the application filing date.

The Governor of Oregon has designated the Oregon Department of Energy as the agency responsible for preparation of a safety advisory report for the proposed Bradwood Landing LNG terminal. Therefore, enclosed for filing in the above-mentioned proceeding, please find an electronic copy of the safety advisory report for the proposed LNG terminal. If you have any questions in this matter, please contact Catherine Van Horn at (503) 378-4041 or catherine.vanhorn@state.or.us

Sincerely

Ken Niles
Assistant Director
Nuclear Safety and Energy Facility Siting

SAFETY ADVISORY REPORT

ON THE PROPOSED BRADWOOD LANDING LIQUEFIED NATURAL GAS TERMINAL AT RIVER MILE 38 ON THE COLUMBIA RIVER

***PREPARED BY THE STAFF
OF THE OREGON DEPARTMENT OF ENERGY***

JULY 6, 2006

SAFETY ADVISORY REPORT ON THE PROPOSED BRADWOOD LANDING LIQUEFIED NATURAL GAS TERMINAL AT RIVER MILE 38 ON THE COLUMBIA RIVER

The Oregon Department of Energy (ODOE) issues this Safety Advisory Report on behalf of the State of Oregon pursuant to section 311(d) of the Energy Policy Act of 2005 (the Act). The report concerns the application to the Federal Energy Regulatory Commission (FERC) by Bradwood Landing LLC (Bradwood) to construct a Liquefied Natural Gas (LNG) import terminal and associated natural gas pipeline. The Bradwood Landing Terminal would be located in Clatsop County, Oregon on the southern shore of the Columbia River at about river mile 38. Bradwood filed its application with FERC on June 5, 2006.

The Act allows the state to file an advisory report that identifies “state and local safety considerations” within 30 days of the date the application is filed. The “safety” information solicited in the advisory report is largely repetitive of information that Bradwood itself provides in its application to FERC in its terminal application and in its Waterway Suitability Assessment to the Coast Guard. It is information that Bradwood also must provide in its emergency response plan to be developed in conjunction with the Coast Guard, the state, and appropriate local jurisdictions prior to any construction.

The State of Oregon has been intimately involved in reviewing and commenting on Bradwood Landing’s pre-filing and application resource reports, and is involved with the Coast Guard in reviewing the project’s WSA. To the extent that the State disagrees with the information Bradwood has provided or will provide on safety issues in those venues, the state will pursue corrections or changes through the above review processes. For example, Bradwood has not accurately or adequately characterized in its Waterway Suitability Assessment (WSA) the area’s emergency response capabilities. The Department will work with the Coast Guard, other state agencies and local jurisdictions to correct the information under the WSA process.

The State considered providing FERC with specific scenarios for evaluating accidental or intentional releases of LNG from a vessel or the facility itself. Again, however, such scenarios play a role both in the WSA and in the forthcoming emergency response planning. Moreover, based on recent Commission approvals of LNG terminal projects, the State believes the Commission will find that the risk of any potential LNG release scenario can be reduced to an acceptable minimum.

On June 15, 2006, the Commission approved three new LNG terminal projects: Semptra’s Port Arthur LNG in Port Arthur, Texas; Cheniere’s Creole Trail LNG in Cameron Parish, Louisiana; and BP America Production Company’s Crown Landing LNG in Logan Township in New Jersey. The language in the Commission’s Creole Trail decision about the risk of an accidental LNG release is mirrored in the other two decisions:

Based on the extensive operational experience of LNG shipping, the structural design of an LNG vessel, and the operational controls imposed by the Coast Guard and the local pilots, a cargo containment failure and subsequent LNG spill

from a vessel casualty – collision, grounding, or allision – is highly unlikely. For similar reasons, an accident involving the onshore LNG import terminal is unlikely to affect the public. As a result, the FEIS determined that the risk to the public from accidental causes is negligible.

Further, the language in the Commission's Creole Trail decision about the risk of an intentional LNG release is also mirrored in the other two decisions:

Unlike accidental causes, historical experience provides little guidance in estimating the probability of a terrorist attack on an LNG vessel or onshore storage facility. For a new LNG import terminal proposal having a large volume of energy transported and stored near populated areas, the perceived threat of a terrorist attack is a serious concern of the local population and requires that resources be directed to mitigate possible attack paths. If the Coast Guard issues a Letter of Recommendation finding the waterway suitable for LNG marine traffic, the operational restrictions that would be imposed by the Lake Charles Pilots on LNG vessel movements through this area, as well as the requirements that the Coast Guard would impose, would minimize the possibility of a hazardous event occurring along the vessel transit area. While the risks associated with the transportation of any hazardous cargo can never be entirely eliminated, we are confident that they can be reduced to minimal levels and that the public will be well protected from harm.

For the above reasons, what the State provides in this advisory report largely is broad safety policy statements about the proposed Bradwood project along with a limited amount of specific, technical comments. In addition, the State is attaching one letter each from the cities of Warrenton and Astoria and a package of information from Clatsop County for FERC's consideration. As well, the State of Oregon incorporates by reference the safety comments included in all of the State of Oregon/Department of Energy previous filings to the FERC Northern Star Docket #PF05-10-000, and especially those comments and attachments submitted on October 5, 2005, and posted to the docket on October 17, 2005.

Although the application to FERC is limited in scope to the LNG terminal and associated pipeline, we consider the risks from a release of LNG on the river to be among the most significant safety concerns associated with the facility. The safety of the LNG terminal is strongly connected to the question of safety on the river and in the communities that the LNG carriers must pass. We expect FERC to address issues and concerns raised by stakeholders in those communities and to consider the safety of those communities in determining whether to approve the LNG terminal and associated pipeline.

Each of the state and local agencies in Oregon, whether or not they contributed to this advisory report, reserve their right to file additional joint or separate comments and/or evidence on safety and other issues.

State of Oregon General Policy Comments

1. **FERC should require an applicant to commit to 100 percent of the safety and security costs directly associated with the LNG vessel transits, the facility and the pipeline.**

Under Section 311(e)(2), an emergency response plan to be developed prior to construction must include a cost-sharing plan that includes a “description of any direct cost reimbursements that the applicant agrees to provide to any State and local agencies with responsibility for security and safety at the LNG terminal and in proximity to vessels that serve the facility.” The State understands and appreciates that Bradwood Landing has agreed thus far to pick up the costs of most safety and security needs that the company has identified as necessary. However, the local jurisdictions are not in a position to dedicate their own limited funds to any LNG safety and security measures that may be required. In addition, local jurisdictions may not agree with an applicant about the level of resources required. An applicant should first be required to pay for an adequate assessment of safety and security needs and then pay for all infrastructure, planning, training and other associated costs identified in an emergency response plan agreed to by the state and local jurisdictions. Should FERC not require the applicant to commit to 100 percent of the costs, FERC should explain its authority for imposing such costs on local jurisdictions and the state.

2. **The safety/security zones proposed for the vessel in transit and the vessel at dock must be sufficiently calculated and justified. The applicant or Coast Guard must thoroughly explain any changes to those zones that might accompany heightened national security as well as any resulting impacts.**

Some area residents have expressed concern that the safety/security zones will be so large that they will “shut down” traffic on the Columbia River or access to Clifton Channel near the proposed terminal site. Others have expressed concern that the safety/security zones will be too small, sized to avoid the above concern rather than for adequate safety protection. Any zones proposed should provide a rationale for their size.

3. **FERC should require an applicant to complete an acceptable emergency response plan prior to any Commission decision on an application and in conjunction with the Coast Guard’s validation of the Waterway Suitability Assessment.**

Under Section 311(e)(1), FERC will not require Bradwood to create an emergency response plan until after a positive decision by the Commission and just before any final approval to begin construction. However, to the extent that Bradwood’s Waterway Suitability Assessment relies on the creation of a satisfactory emergency response plan to ensure that the Columbia River is suitable for LNG, that emergency response plan must be available for review prior to any decisions on both the WSA and the FERC application. It would be illogical for either the Commission or the Coast Guard to decide that LNG is safe for the region without knowing first if a suitable emergency response plan can be enacted along the vessel route and at the facility.

4. **The applicant’s Emergency Response Plan must be developed in full cooperation with state and local authorities, including authorities from Washington State.**

Emergency response planning must be an integrated, carefully developed effort with those potentially affected from both sides of the river.

- 5. The applicant's Emergency Response Plan must sufficiently and accurately characterize the emergency response capabilities along the vessel transit route and near the facility, including response times. The Plan must mitigate for any safety gaps.**

Thus far, the state and local jurisdictions have not seen in Bradwood's assorted filings accurate characterizations of the area's stretched emergency response capabilities. Clatsop County, the cities of Warrenton and Astoria, and the rural Knappa Fire Protection District all have expressed concern about the lack of personnel, equipment and storage facilities to support an LNG vessel and terminal/pipeline. In addition, Highway 30's slow, winding character, greatly affected by inclement weather, as well as the condition of Clifton Road should be taken into account in any discussion of emergency response capabilities.

- 6. The applicant's Emergency Response Plan must include all potentially affected communities along the LNG vessel route and near the terminal in a comprehensive, thoroughly publicized warning system.**

Any community located within one of the three Sandia zones of impact must be considered in emergency response plans, including access to a reverse 911 system and sirens.

- 7. The applicant's Emergency Response Plan must account for potential population increase due to tourism.**

According to a 2004 Clatsop County Grand Jury Report, Clatsop County's population can increase by 50-to-100 percent or more during high tourism season. Depending on the location of those visitors, the influx may bring challenges for LNG emergency response education as well as LNG ship transit education

- 8. Any FERC authorization for an LNG terminal and associated pipeline in Oregon must fully comply with Oregon state and local laws and regulations, including energy facility siting laws.**

In particular, the State of Oregon requires large energy facilities to provide a bond or letter of credit to ensure that the proposed site can be restored to a useable, non-hazardous condition. We consider the bond or letter of credit to be a safety precaution against a potentially abandoned or otherwise vacated site. Thus far, the applicant does not appear to have addressed this issue in its application materials.

State of Oregon Specific Comments

Terminal Design

In resource reports 1 and 11, Bradwood Landing has committed to designing and constructing the terminal in accordance with all requirements of 49 CFR 193 and National Fire Protection Association (NFPA) 59A. Resource report 1 states that the primary storage tank may be constructed of either nine percent nickel steel or, alternately, prestressed concrete. While either construction method is allowed by NFPA 59A, FERC should require that the safer option be selected.

Resource reports 1, 11 and 13 consistently commit to compliance with NFPA 59A and codes referenced therein, but with little information on the actual details of compliance. Even if detailed design information were available, the short deadline for this advisory report does not

permit a detailed design review, sufficient to audit Bradwood Landing's design against NFPA code requirements on a line-by-line basis. We expect FERC to perform this detailed design review, and reserve the right to comment on design issues as more time and more information become available.

Hazard Identification

Hazards potentially affecting the public are discussed in Resource Report 11 and its attachments. As required by NFPA 59A, Bradwood Landing used the LNGFIRE and DEGADIS codes to calculate thermal radiation and vapor dispersion from the design basis spill. Resource report 11 includes isopleth drawings and input decks for these calculations at Attachment 11A. As noted above, the short deadline for this advisory report did not allow a detailed review of all the inputs and assumptions to these calculations. However, FERC should verify that Bradwood Landing chose the most conservative assumptions regarding break size, meteorological conditions, and accident scenario for all calculations. The input tables in attachment 11A show assumptions regarding pipe break sizes and leak rates. FERC should verify that the most conservative values were selected. For pipe breaks, the most conservative assumption is a non-mechanistic double ended ("guillotine") break with all pumps running. We assume but could not verify that this was the break used for calculation purposes. Bradwood Landing should use this break unless it can demonstrate that either a smaller break is more conservative or the guillotine break in this circumstance is not credible. We also assume but could not verify that intentional spills were assumed, since they likely bound any accident scenario.

We note that thermal radiation maps in attachment 11A appear to be centered at the tanks, and extend out to the dock. Because the accident or intentional spill could just as easily happen at the carrier or the unloading arms, the thermal radiation maps and vapor dispersion maps should be shown centered at the location closest to an affected population (in this case, the dock). For the Bradwood Landing site the nearest affected population is most likely the residences on Puget Island.

Our review of attachment 11A shows that the meteorological conditions assumed appear to be average conditions. For example, 51.5 degrees Fahrenheit, 50 percent relative humidity, and 4.5 mph wind speed may not be worst case conditions. Similarly, the assumption of pure methane is probably not representative of actual cargo and may not be conservative. We expect FERC to verify that conservative assumptions were used in NFPA 59A required calculations. The EIS for this project should explain how these assumptions were made and why they are the most conservative.

Quality Assurance

At various sections of its application, Bradwood Landing takes credit for the programmatic measures it will take to ensure that systems and components important to safety will function as designed. At resource report 1, section 1.4, Bradwood Landing commits to a quality assurance program "***in accordance with Bradwood Landing's standard policy***." In resource report 11, Bradwood Landing takes credit for programmatic safety measures such as enforcement of procedural compliance during construction and operation.

We agree that a rigorous and comprehensive quality assurance program is as essential to safety as the design of the facility or its location. However, our review of 49 CFR 193 and NFPA 59A did not reveal any standards for an acceptable QA program. Other than the reference to Bradwood Landing standard policy, the applicant did not identify the elements of its program. If the program is standard policy, then a sample plan from a previous project should be available for state and public review. We would expect to see evidence that the QA function is independent of operations, scheduling or budgeting. We would expect to see steps to ensure that:

- i metal components are fabricated of metals with the specified metallurgical content and properties,
- ii concrete or other structural materials are tested to the strength specified,
- iii vendors of equipment and material are audited by qualified auditors,
- iv nondestructive tests are observed and approved by independent quality control personnel,
- v personnel performing safety related construction or operation activities are properly qualified, with documentation of that qualification available for audit,
- vi construction and operations are performed in accordance with approved procedures,
- vii only controlled copies of design documents are used in construction, with only the current revision used in the field,
- viii all changes in design documents are carried forward to other related and associated design documents,
- ix measurements are made with equipment that is calibrated and traceable,
- x conditions adverse to quality are subject to a corrective actions program that results in actions to prevent recurrence.

Safety Issues

The material in resource report 5 describes an area of relatively low population density, with most affected houses on Puget Island in Washington state. As noted above, a complete description of the affected area would take into account the City of Astoria, a growing community with increasing tourism largely concentrated along the shoreline.

As written, the resource report is misleading in that it characterizes the entire county for population density. The resource report fails to adjust for the fact that most of that population is along the shoreline, quite close to the river channel where the LNG carriers would travel. Therefore the potentially affected population is actually much higher in density than implied in the application. The report also does not mention that during parts of tourist season, the population can more than double. Roads during particularly busy summer weekends frequently back up. This would be a particular concern in the unlikely event that an evacuation might become necessary.

The State of Oregon has reviewed the Safety Advisory Report on the proposed LNG terminal at the Port of Long Beach (POLB) issued by the California Energy Commission (CEC). That report relies largely on material taken from two readily available reports: (1) the Sandia Labs' November 2004 report "Guidance on Risk Analysis and Safety Implications of a Large Liquefied Natural Gas (LNG) Spill Over Water" (Sandia Report) and (2) Richard Clark's "LNG Facilities in Urban Areas."

The safety significant events listed in Sandia and Clark and quoted in the CEC advisory report could apply to any terminal at any location and need not be repeated in this report. However, we agree with CEC that the 5 kw/m^2 is described in the Sandia Report as “the permissible level for emergency operations lasting several minutes with appropriate clothing” (Table 6, p.38). This is the lowest heat flux shown in the thermal radiation maps provided in Attachment 11A. Because the people occupying the nearest residences (those on Puget Island) are relatively far from the nearest fire station and do not have the appropriate clothing or emergency training, thermal radiation calculations should show the point at which worst case heat flux will permit safe evacuation, possibly requiring more than “several minutes” and without appropriate clothing or emergency training. The CEC advisory report at p. 15 suggests 1.5 kw/m^2 . Bradwood Landing should calculate the distance to this heat flux for a design basis event at Bradwood Landing and issue a figure showing the results. As noted previously, Bradwood Landing should calculate this distance not from the tanks but from the point on the facility nearest the affected properties (presumably the dock).

Emergency Response Capabilities near the Facility Location

We note that Bradwood Landing, in its application, commits to an Emergency Response Plan but did not provide a detailed description. To our knowledge, FERC has not issued rules, regulatory guidance or a standard review plan for an acceptable emergency response plan for LNG facilities. We are familiar with the U.S. Nuclear Regulatory Commission’s NUREG 0654, which is the regulatory standard for emergency plans at commercial nuclear plants, and consider it to be one good model, although not the only model.

Whatever model is used, FERC should make clear to the public what elements it is looking for in an emergency plan. Although the details of the WSA are withheld from public disclosure, information regarding measures to protect the public during a design basis event should be a part of public outreach and should be available before the issuance of a FERC construction permit. Most important, the communities along the Oregon and Washington shore are correctly characterized in the resource reports as primarily rural communities without extensive police, fire and emergency medical organizations. If the hazards assessment in the WSA shows that more resources are necessary in these communities to respond to a design basis emergency, the communities can only get these resources if Bradwood Landing funds them.

###

**MEMORANDUM**

TO: Andy Jordan, Clatsop County Counsel

FROM: Kathleen Sellman, Community Development Director *us*

SUBJECT: Bradwood Landing Proposal Comments

DATE: June 30, 2006

**Department of
Community Development**
800 Exchange Street
Suite 100
Astoria, Oregon 97103

Clatsop County has prepared a number of detailed comments in response to the Bradwood Landing Terminal Application Under Section 3 of the Natural Gas Act. Many of our comments were raised in our March 29, 2006, letter to Magalie Salas, Secretary, Federal Energy Regulatory Commission (FERC) in response to Bradwood Landing's draft resource reports. It does not appear that the Resource Reports now under review have addressed these concerns adequately.

**Economic Development
Planning & Development**
Telephone (503) 325-8611
Fax (503) 338-3666

Attachment 1 is a Memorandum dated June 30, 2006, prepared for Clatsop County by Columbia River Estuary Task Force (CREST), a council of governments of which Clatsop County is a member. That Attachment contains several numbered exhibits. Attachment 2 is a Memorandum from Public Works Director Ed Wegner dated June 27, 2006.

Building Codes Division
Telephone (503) 338-3697
Fax (503) 338-3666

Inspection Request Line
(503) 338-3698

In summary, the county asserts the following orders from FERC are necessary to preserve the public interest:

Clatsop County requests FERC to order Bradwood Landing Terminal to comply with the county's adopted land use regulations in the siting and development of its proposed liquified natural gas project. A Use and Permit Matrix Exhibit included in Attachment 1 provides the county's best effort to specify the land use requirements. While a portion of the Bradwood Landing site has been identified as future water-dependent development in the comprehensive plan, such future development has been described as small to medium in scale. Some portions of the site are zoned at this time to support industrial development, but other portions are not. Compliance with local land use ordinances and plans is integral to consistency with the Coastal Zone Management Act. The county reserves the right to expand or otherwise modify the approvals required when site-specific information becomes available from the applicant.

Clatsop County requests FERC to order the applicant to enter into a cost reimbursement agreement with the county for additional staff time, training, and expertise related to the review and inspection of land use plans, building plans, and site development and construction. A highly technical and specialized project such as this one may require, for example, additional training for Clatsop County inspectors or the temporary hiring of third party expertise.

Clatsop County requests FERC to order the applicant to fund 100% of costs related to public safety response related to development and operation of the proposed facilities. Such costs include both capital expenditure and ongoing operational costs including personnel, equipment and equipment storage, transportation, emergency access and facilities, and training.

Clatsop County requests FERC to order the applicant to fund 100% of capital improvements required to mitigate impacts of the proposed LNG facility's development and operation including improvement of transportation facilities such as Clifton Road. The applicant is producing a Traffic Impact Study and Traffic Management Plan. County Sheriff Tom Bergin expresses particular concern about increasing the volume of large truck traffic on Highway 30. Highway 30 is characterized by curves and no alternative route exists when it is closed as for a major accident.

Please let me know if you require additional information to prepare the county's protest.

ATTACHMENT I

DATE: July 3, 2006

TO: Kathleen Sellman, Clatsop County CDD Director

CC: Patrick Wingard, Senior Planner

FROM: Catie Fernandez, Coastal Planner

SUBJECT: Comments to the Northern Star Natural Gas proposal to the Federal Energy Regulatory Commission for a liquid natural gas terminal at Bradwood, Oregon

Bradwood Landing, LLC (also commonly referred to as Northern Star Natural Gas or NSNG) filed an application for authorization to site, construct and operate a liquefied natural gas terminal for the purpose of importing LNG into the United States under with the Federal Energy Regulatory Commission (FERC) on June 15, 2006. The project is proposed for Bradwood, Oregon, a former mill in Clatsop County.

CREST staff has prepared comments relative to the Resource Reports provided by Bradwood Landing, LLC as part of the FERC application. The comments are organized by Resource Report and attempt to relate as much as possible to Clatsop County's Land and Water Development and Use Ordinance (LWDUO), Standards Document and Comprehensive Plan. However, the comments do not represent a comprehensive review of the proposal to the County's approval criteria for land use applications.

This memo includes a number of attachments as follow:

Exhibit 1	Comments to draft Resource Report 8 dated March 29, 2006
Exhibit 2	Use/Permit Matrix
Exhibit 3	CREST memo to Clatsop County regarding dredged material management plan dated May 23, 2006 and revised June 20, 2006.
Exhibit 4	CREST Comments to Resource Report 2, dated July 3, 2006

A. General Project Comments

The Bradwood site was envisioned as an industrial site for a small to mid-size industrial use. This is reflected in the site's zoning designations, and supporting infrastructure. Elements of the proposed development are not permitted as currently zoned. Areas of the Bradwood site that can support industrial uses are zoned MI (Marine Industrial) and AD (Aquatic Development). Surrounding aquatic and wetland areas are zoned AC-2 (Aquatic Conservation Two) and AN

(Aquatic Natural) due to the ecological functions they provide. These land use designations are the product of a larger management plan for the Columbia River Estuary. Additional background was provided to FERC during the pre-filing process, and is enclosed as Exhibit 1 to this memo.

The Clatsop County Community Development Department asserts that compliance with local land use ordinances is integral to consistency with the Coastal Zone Management Act (CZMA).

County Staff has expended considerable time monitoring and commenting to the FERC pre-filing process, and now the filing process. This time has come out of a budget that has no contingency for a project of this scope or venue. If and when land use applications are submitted to the County for review, the County's land use application fee will be required with application. For a project of this nature, it is expected that the applicant, will enter an agreement with the County to reimburse for staff review time and materials beyond the application fees. This will allow the County to thoroughly review applications within the state-mandated timelines by hiring additional assistance for the review and/or pay for overtime as deemed appropriate by the Community Development Director.

Similarly, it is expected that the applicant will enter an agreement to reimburse the County for additional staff time and expertise related to the review and inspection of building permits.

B. Resource Report 1. Project Description

This Report, as the name implies, provides an overview of the overall project, including site description, terminal facilities, facilities in the aquatic areas, and off-site facilities such as roads and power lines. In the absence of land use applications or specific information relating to the County's ordinances, the following comments are provided. The comments attempt to relate the project activities and elements to County Ordinances, but given the volume and organization of materials, the following comments are not an exhaustive review of the project relative to all applicable County regulations. Exhibit 2 to this memo is a matrix that identifies the various project components, to the best extent possible, the zoning of that project component, and the land use permits that would be required.

The report does not address the pipeline, which is submitted as a separate filing. CREST, on behalf of the County, reserves the right to comment relative to the pipeline proposal in the future.

1. An in-water berth measuring 330 feet in length and 45 feet in width is proposed. New mooring dolphins are also proposed. The berth and dolphins appear to be proposed in waters that are zoned Aquatic Development by Clatsop County. While dredging and piling installation for water dependent industrial uses is permitted, these activities are subject to the Development Standards of the AD zone (LWDUO Sec. 3.754) and the requirements of the Standards Document (S4.208 and S4.232). Compliance with these standards has not been established.

In addition to the berth, an extensive turning basin will be necessary. The turning basin are proposed to be located in areas zoned AD and AC-2. Dredging for the berth and turning basin or installation of any piling/dolphins are not permitted in the AC-2 zone. Under the normal course of land use review, these activities could only be permitted if the zoning of the aquatic area were changed. This information was submitted to FERC when the second round of Resource Reports were submitted by NSNG during the pre-filing process (see Exhibit 1 to this memo).

At this point, NSNG has not submitted any requests for land use approvals, including zone changes to Clatsop County. NSNG has asserted that all County land use permits are preempted by the FERC siting process. To date, NSNG has provided a draft Coastal Zone Consistency determination document to the State of Oregon, Department of Land Conservation and Development (DLCD). This document included an identification that the site is not zoned properly, but provided inadequate information to support the document's conclusions that a zone change is appropriate for this site.

2. The report identifies that Bradwood Road is proposed to be widened to 24-feet in width. NSNG should ensure that the road is constructed to Clatsop County Public Works Standards. These standards are administered by the County Roadmaster through the County Public Works Department.
3. Hunt Creek Bridge is proposed to be replaced with a 90 foot long by 28.5 foot wide rail car crossing. Based on the plans provided, it appears that the bridge and associated support structures will be located in the F-80 (Forest-80), AN (Aquatic Natural) and Marine Industrial (MI) zones. The purpose of the Forest-80 zone is to protect the County's forest income by conserving the County's forest lands and assuring continuous growth of forest lands for harvest with sound management of natural resources. To that end, new bridge support structures are only permitted as a Conditional Use after a goal exception to the County's agricultural and forestry goals has been taken. As described under item 2, taking a goal exception is an involved process that requires significant demonstration on the part of the applicant that the exception is warranted. In the AN zone, bridge crossings are a Review Development. This means that the applicant would need to show that the standards of the AN zone are satisfied, including that the development satisfies all policies of the Comprehensive Plan, Estuarine Resources and Coastal Shorelands Element in addition to the Columbia River Estuary Shoreland and Aquatic Use and Activity Standards. The portion of the bridge support structure in the MI zone is a Conditional Use, meaning that the development needs to satisfy the standards of the MI zone including all policies of the Comprehensive Plan, Estuarine Resources and Coastal Shorelands Element in addition to the Columbia River Estuary Shoreland and Aquatic Use and Activity Standards. In addition, uses that are listed as Conditional in the LWDUO are reviewed on an individual basis to determine if the use is compatible with their location, surrounding uses and the comprehensive plan.
4. The existing Portland and Western rail line is proposed to be relocated in order to accommodate the terminal facilities. The realignment would move the rail line from the Marine Industrial zone to the Aquatic Natural zone. The rail line is not permitted in the Aquatic Natural zone. NSNG has opined in the draft CZM consistency document that a zone change is warranted for the relocation of the rail line. However, there is no compelling evidence to support encroachment into natural resource areas. The Marine Industrial boundary has been established for the areas of the Bradwood site that are appropriate for industrial development. The argument that a zone change or encroachment into the AN zone simply for the purpose of allowing larger scale development than originally envisioned at the Bradwood site is not compelling and falls short of zone change criteria.
5. In addition to establishing zoning districts, the County has established riparian areas (also referred to as "riparian buffers" or "riparian zones") associated with water bodies and wetlands. Setting land use designation or zoning aside, the relocated rail line does not appear to meet this requirement of the County's standards. Areas of riparian vegetation are identified as 50-feet from the mean high waterline area for estuarine rivers and sloughs. Where emergent wetland vegetation exists next to a river, the 50-feet shall be measured from the landward extent of the emergent wetland area. If a shrub or forested wetland area exists next to a river, the zone of riparian vegetation shall be the entire area of shrub or forested wetland. This requirement is applied throughout Clatsop County, regardless of zoning district and whether or not a use is considered an "approved use", "review use" or "conditional use".
6. A 5-acre temporary construction parking lot is proposed off of Highway 30 at Clifton Road. The parking lot is proposed in the F-80 zone. This use is not permitted in this zone, as its purpose is to reserve forest lands for production. Setting aside the zoning issue, the Community Development Department recommends against locating the parking area at this location due to its isolated, rural nature. The parking area as proposed appears to offer easy opportunity for car prowls, particularly if construction schedule demands nighttime work. County resources are already stretched thin, and minimizing situations that will require additional law enforcement is a high priority. Further, NSNG's effort to "encourage carpooling" as mentioned in other Resource

Reports appears to be superficial at best. The County recommends limiting parking to the development site, while providing real incentives for carpooling or providing a shuttle bus service from an urbanized area.

7. A 1.6 mile electrical powerline is proposed from the Bradwood Landing site to the existing electrical infrastructure. The structures supporting the lines are proposed to be 65 feet in height. A 105 foot right of way is proposed to be cleared to accommodate the line, and the applicant's materials indicate that the alignment is, "to be determined during detailed engineering". However Figure 1-23 shows an aerial photo with an overlay of the proposed line and 105 foot right of way. The powerline and its associated right of way appear to pass through the riparian buffer associated with the Columbia River. As mentioned previously, the riparian buffer is 50-feet from the river, or in the instance where a shrub or forested wetland area exists next to a river, the entire area of shrub or forested wetland is the riparian area. Throughout Clatsop County, removal of vegetation in the riparian area is not permitted to accommodate development needs.

8. The two concrete storage tanks, which are 160 feet in height and 262 feet in outer diameter are proposed to be constructed upon dredge spoils. The applicant has provided a geotechnical report (Attachment 6B to Resource Report 6). It is anticipated that this report includes detailed information to assure the Clatsop County Building Codes Division that the soils are structurally sound to support the tanks. Additional geotechnical work may be required of the applicant at the time of building permit application to ensure compliance with County Ordinances and the International Building Code.

9. Resource Report 1 also briefly touches on "other" components of the development including such features as pipe racks, administrative offices and the control room. All of the structural elements will require building permits and inspections to ensure compliance with the applicable building codes. For a project of this nature where the components are highly technical and specialize, additional training for Clatsop County inspectors or the temporary hiring of third party inspectors may be required.

10. The County's standards document requires that water be provided for new development by either a public water system, well, spring, river, stream or pond. Depending on source, a permit from the State Water Resources Board will be required. Non-potable water for construction and irrigation is proposed to be drawn from an on-site well. It is assumed that the State Watermaster will comment relative to water rights and Permits. River water is proposed for ship ballast water (approximately 11-14 million gallons per carrier) and on-board cooling mechanisms as well as terminal fire suppression systems, which are tested on a weekly basis. Again, a permit from the State Water Resources Department will be required. Additionally, it is assumed that other regulating agencies, such as NOAA will identify the environmental issues and impacts to threatened and endangered species associated with drawing this volume of water from the Columbia River. Potable water is proposed to be provided by trucking in bottled water. Again, the County's standards document requires that water be provided for new development by either a public water system, well, spring, river, stream or pond. It does not make allowances for bottled potable water. This is an issue that will need to be resolved if/when the development moves forward.

11. One feature that the report doesn't address is a waste water outfall. It is assumed that the non-potable water used for construction purposes and operation of the facility will be returned to the Columbia River (water is proposed to be drawn from an on-site well for non-potable uses; bottled water is proposed for potable uses and hydrostatic testing; and, river water is proposed for ballast water and on-board cooling). Any outfalls, either for the return of waste water or storm water are subject to the requirements of Clatsop County as identified in Exhibit 2.

12. Attachment 1-A to Resource Report 1 is the NSNG Dredged Material Placement and Management Plan. Comments to this plan are provided in the attached memo from CREST to Clatsop County dated May 23, 2006 and revised June 20, 2006 (Exhibit 3).

C. Resource Report 2, Water Use and Quality

Please see Exhibit 4 to this memo.

D. Resource Report 3, Fish, Wildlife and Vegetation

The following comments are provided by Columbia River Estuary Study Taskforce (CREST) as the County has an interest in ensuring that new development does not negatively affect natural resources. In general, work proposed in the estuary is subject to an Environmental Impact Statement (EIS). The EIS will need to address many of the same issues discussed in Resource Report 3.

1. Page 5, paragraph 6: Need more detailed "local" information on sturgeon and their habitat in the Columbia River. Adults use shallow water as well as juveniles. Generally much too thin on sturgeon information and needs many more references for the Columbia River.
2. Page 6, paragraph 2: Cutthroat "roam" throughout the lower Columbia River, they do not remain in "these streams" throughout their life cycle. The report needs much better information on Columbia River cutthroat life history and many more references.
3. Page 6, paragraph 3: Need references and more information on shad.
4. Section 3.2.2.1, paragraph 1: Is there no EFH for chum? Needs to be mentioned.
5. Page 6 (3.2.2.1): Very poor information regarding Columbia River chinook salmon, needs much better references. There are a ton of papers and reports on the life history of chinook salmon, include these in this section.
6. Page 7, Coho: Very poor information regarding Columbia River coho salmon, needs much better references. There are a ton of papers and reports on the life history of coho salmon, include these in this section. This section stated that "most coho fry stay in for 1 year". This is not accurate, some stay, some go that year. Needs much better more accurate information on the life history of the lower Columbia River coho.
7. Page 7, Rec Fishing, last paragraph: Needs much more information on recreational fishing in the lower Columbia. Section should include times of year, how many people are out there, etc...Also take out the popularity of warm water species which seems too much like an opinion rather than true facts.
8. The following sections are suggested reading and references that could be included into the report. These do not include any references on life history of salmonids in the lower Columbia River.

E. Resource Report 4 Cultural Resources

Resource Report 4 appears to address relevant historic and cultural resource issues, however, agencies with more expertise, such as the State Historic Preservation Office (SHPO) may require additional information. If the project moves forward, and archaeological resources are discovered during excavation or construction, the resource shall remain intact until a plan for excavation or reinternment has been developed by the State Historic Preservation Office.

F. Resource Report 5 Socioeconomic

1. The report explores the effects to commercial/recreational craft should safety zones be implemented around LNG carriers. The safety zones analyzed include a 1,000 yard zone (ahead and back) or a two mile ahead, one mile back scenario. The report also assumes a 200-yard zone when ships are docked at Bradwood and draws the conclusion that access to Clifton Channel would not be affected. It is unclear why a 200-yard zone assumption was made for a docked LNG carrier. However, if the Waterway Suitability Analysis (WSA) process results in a greater safety zone for docked carriers, there is a higher likelihood that access to Clifton Channel will be impacted (particularly in light of Army Corps navigational structures that are in the water at this location).
2. The report provides an overview of existing emergency service providers and makes no prediction or assumptions as to what additional public safety measures may be needed with the development of an LNG facility. It is expected that additional information is provided in the Waterway Suitability Analysis (WSA), although the WSA has not been made available for Community Development Staff's viewing. Due to the critical nature of public safety as it relates to this project, it is imperative that local first responders be involved in the development of this report. In particular, the numbers in Table 5-7 should be verified. Also, Table 5-7 should be qualified somehow to account for the local road conditions. Distance in miles may be deceptive due to slow traffic on Highway 30 caused by weather conditions (fog, rain, wind) and seasonal tourist traffic. It should also be noted that there are no alternate routes should Highway 30 be closed due to landslide, fallen trees or other hazard. It is also expected that the applicant will fully support additional public safety measures to accommodate a development of this nature.
3. The report briefly discusses existing transportation facilities and identifies that a traffic study is being developed for County Review. At this time, the traffic study has not been submitted.
4. With regard to rail service, an agreement to move the Portland & Western rail line is attached to this report. It should be noted that the area proposed for rail realignment is zoned AN (Aquatic Natural) due to the ecological value associated with the wetlands/riparian vegetation surrounding the Bradwood site. This issue is discussed in greater detail in section B.4 of this memo.
5. Appendix A, River Use Impact Analysis concludes that there is a general downward trend in shipping traffic on the Columbia and cites the loss of the Hyundai, K-Line and Evergreen lines to support this conclusion. However, in the recent past, the Port of Portland has recently added container service from Yang-Ming and ZIM AMP. These container line additions have been widely publicized, and it is unknown to CREST Staff if there have been any other developments that will increase or decrease shipping traffic in the Columbia River. The most recent data related to ship traffic should be reflected in the applicant's report and in the Environmental Impact Statement.
6. Appendix A also addresses recreational use of the river, including fishing. The report discusses spikes in fishing activities with seasonal fisheries, including Buoy 10 and suggests that timing LNG passages with the seasons could help mitigate conflicts.
7. "Wildlife Viewing" is discussed briefly in Appendix A, with a conclusion that wildlife viewing will not be affected by the construction or operation of the plant because it is located on private property. This section of Appendix A does not consider the potential for wildlife viewing from the river, particularly the value that the Bradwood Cliffs provide.

G. Resource Report 6 Geologic

The Bradwood site is not within the County's Geologic Hazard Overlay (GHO). However, additional geotechnical reports may be required by the Building Official to establish the site soils, particularly the dredged materials are suitable for construction.

1. Section 6.6 of Report 6 discusses the potential need to blast through basalt for the relocated Portland and Western rail line. The impacts of blasting should be a consideration in whether or not it is appropriate to move the rail line into an area that is zoned AN (Aquatic Natural).
2. Section 6.9.1.1 addresses flooding hazards and notes that the dredged materials placed on the site, once graded, will bring the site above flood elevation of 10-feet NGVD. The applicant and FERC should note that the site is mapped as floodplain on FEMA's Flood Insurance Rate Maps (FIRM), and will be treated as floodplain until such time the maps are revised. The applicant or property owner can initiate a map revision by filing the appropriate documents (Letter of Map Revision based on fill) with FEMA.
3. Section 6.12.2 discusses shoreline erosion and potential shoreline stabilization measures that may be implemented in the future. The applicant and FERC should note that shoreline stabilization is reviewed by Clatsop County as part of a land use permit. For areas zoned MI (Marine Industrial) and AD (Aquatic Development), vegetative shoreline stabilization is a permitted use and will require a development permit only while structural shoreline stabilization is a Review Use, subject to a Type II (public notice – no hearing) review in addition to a development permit.
4. Also, it should be noted that there is anecdotal reports of a portion of the Bradwood Cliffs sheering off, creating a wave that caused extensive damage on Puget Island.

H. Resource Report 7, Soils

1. Section 7.2.3.1 discusses revegetation of the temporary impact area and that this area will be seeded with grass rather than shrubs or trees. Vegetation removal in these areas needs to be reconciled with 1) impacts to wetlands, 2) conflicts with county zoning and 3) the requirement of Clatsop County's Land and Water Development and Use Ordinance for 50-foot riparian buffers and a 50-foot buffer around industrial development in the MI (Marine Industrial) zone.
2. Section 7.2.3.1 also discusses soil erosion control measures along the riverbank, including, slope breaks, mulching and rock armoring, as appropriate. As mentioned previously, bank stabilization requires review by Clatsop County pursuant to the Land and Water Development and Use Ordinance (discussed further under Report 6).
3. This Report also discusses that an erosion control plan will be prepared in the future. Erosion control plans are required by Clatsop County with all Development Permit applications.

I. Resource Report 8, Land Use, Recreation and Aesthetics

Clatsop County provided comments to the draft Resource Report 8 as part of the FERC pre-filing process. In general, Resource Report 8 has not been updated or revised to sufficiently address the County's comments and concerns as it relates to land use. These comments are attached for the record (Exhibit 1). Additionally, the following comments supplement those previously provided.

1. Section 8.2.1 indicates that the 52 acre area proposed for the turning basin is primarily within an area designated aquatic development. The report neglects to mention the area (acreage) of the turning basin that require dredging that is located within an area zoned Aquatic Conservation (AC-2). The conservation designation of the area was not arbitrarily applied by the County and Report 8 does not address the resource values that contribute to this zoning designation. As pointed out in the comments to the draft resource report 8 as part of the pre-filing process, the Goal Exception taken for the filling of the log pond for an industrial user specifically does not permit any new dock construction or new dredging projects in Aquatic areas.

2. Section 8.2.1 discusses that the County's Comprehensive Plan anticipates filling of the log pond for an industrial use. The applicant should also be aware that, 1) the area of the log pond will need to be rezoned upon filling and, 2) filling of the log pond is subject to State and Federal removal fill laws and compensatory mitigation requirements regardless of the exception that the County has taken.

3. 8.2.1 discusses Clifton Road and the Hunt Creek Bridge expansions. County comments have been provided in Section B, Resource Report 1, Project Description of this memo.

4. 8.2.1 discusses the facilities for off-loading LNG from carriers and indicates that they will be located in the MI and AD zones. The applicant should note that these facilities are not permitted in the AC-2 zone.

5. Section 8.2.1 indicates that fire suppression water will be drawn from the on-site well. We notice that in Report 1, fire suppression water is proposed to be drawn from the Columbia River. This is a discrepancy that needs to be clarified at the very latest, before building permits are issued.

6. Section 8.2.1 also discusses a buffer area that will surround the project. Clatsop County ordinances include two distinct buffers as it relates to this project. The first type of buffer is a riparian buffer, which is generally 50 feet, and discussed in greater detail in Item A.5 of this memo. The County's Land and Water Development and Use Ordinance also sets forth a buffer for uses in the MI zone. Where the MI zone adjoins a zone other than LI, there shall be an area of depth adequate to provide for a dense evergreen landscaped area which attains a minimum height of 8-10 feet, or such other screening measures as may be prescribed by the Community Development Director. In no case shall the buffer area have less width than the required 50-foot setback of this zone. The MI buffer has more to do with an industrial uses compatibility with surrounding zones, in this case, the Aquatic Development and Forest-80 zones. Therefore, it is expected that there would be a 50-foot riparian buffer provided to all estuarine rivers and wetlands as well as a 50-foot vegetated buffer between all site development and any adjacent zone boundaries. To clarify, the two buffers are not added to each other for a 100 foot buffer, rather, a 50-foot buffer applies to all areas of the site, not simply areas adjacent to rivers and wetlands.

7. Section 8.2.1 also discusses waterway leases and removal-fill permits for dredging and dredged material disposal. Note that the County is required by the State to sign off on these permits prior to submittal to the State for review.

8. Coastal Zone Management Consistency. Section 8.2.5 includes a brief statement with regards to Coastal Zone Management Consistency. Comments relative to CZM consistency have been provided to FERC as part of the pre-filing process (Exhibit 1). A draft CZM consistency certification document has been provided to DLCD, however, it was not included as part of the FERC application. The County Community Development Department believes that compliance with local ordinances is integral to consistency with the Coastal Zone Management Act. To date, adequate evidence for the County to support CZMA consistency has not been provided by the applicant.

9. Section 8.2.6 discusses the zoning of the land where construction of the terminal will occur and provides acreage calculations for each zone that will be impacted. The report also mentions that, "portions of AN land and AC-2 land will be used for purposes not listed as permitted or conditionally permitted in the corresponding zones. Exceptions allowing uses otherwise unpermitted are anticipated by Statewide Land Use Goal 2 and allowed where appropriate reasons justify the exception." This same statement was provided in the draft Resource Report 8. The County prepared a lengthy response to this statement and submitted it to FERC during the pre-filing process (see Exhibit 1 to this document). In the latest version of Resource Report 8, the applicant makes no further efforts to reconcile the zoning conflict.

10. Visual resources. Resource Report 8 has not been amended or improved upon as it relates to visual resources. County comments submitted to FERC (Exhibit 1) indicate that the County identifies the Bradwood Cliffs as a natural and scenic area in the County's Northeast Community Plan and places value on lands visible from the waterway. The LNG storage tanks, which will measure over 160 feet in height will have a significant impact on views of the cliffs from the river, despite the best attempts of the applicant to paint them in a color that will blend with the natural surroundings.

J. Resource Report 9, Air and Noise Quality

The applicant and FERC should note that the County's noise ordinance limits noise between the hours of 10:00 PM and 7:00 AM. Exceptions include businesses in the AF, QM, LI, HI, EFU or F80, or QMO zones and overlays.

K. Resource Report 10, Alternatives

1. Section 10.10.3.3.1 & 2 discuss local and regional alternative sites that were considered for location of the NSNG LNG terminal. Site considerations included, ease of acquiring permits, availability of adequate land, marine and shoreline features, avoidance of major population centers, avoidance of sensitive habitats in construction areas, proximity to pipelines and site control. A Puget Sound location is dismissed due in part, because, "environmental issues and associated regulatory requirements in this region as compared to the proposed project location. The significant permitting issues in the area are related to potential impacts on salmon, wetlands and other resources". Since potential impacts to salmon, wetlands and a host of other environmental issues are raised with the Bradwood application, the applicant's reasoning is ineffective.

2. Section 10.10.3.3.2 further discusses local alternatives based on the various site considerations including site control and availability of adequate land. As commented during the pre-filing process by Oregon's Division of State Lands, the State owns the submersed waters surrounding the site. Further, it could be questioned whether the site contains available adequate land, since the applicant is proposing to move a rail line outside the industrially zoned portion of the site into land zoned Aquatic Natural and dredge a vessel turning basin in aquatic areas with a Conservation designation. In terms of avoidance of sensitive habitats in construction areas, the alternatives analysis is not particularly strong considering the effects this proposed development will have on fish habitat. With respect to fish habitat, the alternatives analysis should consider operational effects such as ballast water intake and waste water outfalls.

3. Section 10.4, Summary and Conclusions includes the following statements:

- *The site is very large and can provide the required space for construction and operation of the terminal and an adequate buffer...*The alternatives analysis does not discuss that the Portland and Western rail line requires movement in to a natural area in order to accommodate the proposed development. Nor does the analysis discuss the extensive dredging required for the turning basin.
- *The site is adjacent to relatively deep water, and has sufficient area for an adequate turning basin.* Again, the alternatives analysis does not address the dredging that must occur to accommodate LNG carriers or the issue of the portion of the dredge area that is zoned Aquatic Conservation.
- *The portion of the site that would be used for the terminal is predominantly zoned for marine industrial use...*Again, there is no mention of the aquatic areas that are zoned aquatic conservation where dredging is not permitted under local ordinances.
- *The site is currently permitted as an official dredge deposit site on the Columbia River.* The analysis does not discuss the fact that upland dredge disposal sites are at a

premium, and upon development, the Bradwood site will no longer be available for disposal.

L. Resource Report 11. Reliability and Safety

Clatsop County Community Development Department offers no specific comments relating to the applicant's reliability and safety report, except to strongly urge provision of adequate police and fire protection for this site, fully funded by the applicant. The County's Comprehensive Plan Goal 11, Public Facilities Background Document discusses the deficiency in the police protection that is being provided in the County. It also recognizes that fire protection is provided by rural fire protection districts, staffed by volunteers.

M. Resource Report 13. Engineering and Design Material

Engineering specifications will be reviewed fully by the Clatsop County Building Codes Division if the project moves forward and an application for building permit is submitted. In the absence of detailed plans, specific comments to this resource report are not provided herein. However, the following general comments are provided.

1. Section 13.1.9 Adjacent Activities discusses a 200-foot vegetation free zone to minimize forest fire. This vegetation free zone will need to be reconciled with the County's requirement for riparian buffers and vegetated buffers around industrial development in the MI zone.
2. Section 13.1.11, Site Development. The applicant and FERC should note that in addition to land use approvals, a development permit and building permits will be required by the County prior to construction. A development permit is required for site grading, prior to any structural elements being constructed as well. In addition to plans and engineering specifications, an erosion control plan will be required with all development permit applications. Road construction is subject to approval by the County Public Works Department and the Community Development Department.

The above comments are provided based on the information available to date. If you have any questions or require any additional information, please contact CREST staff by phone or email. CREST is available for additional comments in the future at the County's request.

RE: Bradwood Landing LNG Project, Docket #PF05-10
Comments on Bradwood Terminal Resource Reports

Dear Ms. Salas:

Clatsop County submits the following comments with the understanding that Northern Star Natural Gas' Bradwood Terminal Resource Reports for both the terminal and the proposed pipeline are at the draft stage. Clatsop County reserves the right to comment on future documents.

If you have any questions, please contact Kathleen Sellman, Community Development Director, at (503) 325-8611 or ksellman@co.clatsop.or.us.

Sincerely,

Kathleen A. Sellman

Page 2, Applicable Zoning Codes. The applicant provides a table (Table 8.1-1) that lists applicable zoning designations. However, the resource report does not detail whether the proposed uses are permitted in these zones or describe the County requirements for review of development in these zones. Of particular concern is the proposed dredging activity within the AC-2 zone. **Note: Dredging is not a Permitted, Conditional or Review use in this zone. In other words, the site is not zoned appropriately for the proposed use.** The applicant should also note that there are mechanisms for requesting zone changes built into the County's Land and Water Development and Use Ordinance and the Clatsop County Comprehensive Plan. However, the applicant bears the burden of proof in establishing the appropriateness of a zone change. To that end, the applicant, must follow the appropriate procedures, identify all applicable County Goals, Policies and Standards and provide findings that establish the proposed zone change as consistent with the County's adopted plans.

Beyond the procedural nature of a zone change, the applicant will need to carefully analyze its request for zone change as the site is located within the Columbia River Estuary. The Estuary is managed cooperatively by jurisdictions within its influence through the adoption of the Columbia River Estuary Management Plan. The Management Plan was formulated by the Columbia River Estuary Study Task Force (CREST), local jurisdictions, state and federal agencies and concerned citizens in response to federal environmental protection laws and the Coastal Zone Management Act. The Management Plan represents a unique bi-state effort to manage the Estuary by balancing development needs with natural resource protection. To that end, the standards of the management plan were adopted into the Comprehensive Plans (for Oregon jurisdictions) and Shoreline Master Plans (for Washington jurisdictions) including the Comprehensive Plan for Clatsop County.

The Bradwood site is specifically addressed in the Columbia River Estuary Management Plan within the Eastern Clatsop Planning Area. The Bradwood Subarea is identified as a former industrial area, a stretch of steep forested shoreline to the east, where the planning areas extends either 200 feet inland or to the extent of geological instability and includes portions of the Columbia River. The subarea plan discusses the fishing resources, tidal marsh and wetlands; soils and old growth vegetation found at Bradwood. The plan also acknowledges the industrial nature of the site, but cautions against large scale development as follows, "The Bradwood industrial site offers excellent potential for small to medium sized water dependent industrial development. There is deep water close to shore, some available vacant land, and railroad access. There are constraints to development, however, including poor highway access and the proximity of the wildlife refuge. Large scale development involving extensive dredging or filling would not be appropriate." The above information is provided so that the applicant can gain an appreciation of the collective thought and effort

that went in to the Estuary Plan and the establishment the zoning district boundaries at the Bradwood site.

Page 2, Dredged Material Disposal. Note that the Bradwood Dredged Material Disposal site is inventoried as site O-38.9 in the Columbia River Estuary Dredged Material Management Plan. The site's capacity is 420,000 cubic yards and special conditions apply to disposal of materials including:

- Runoff from the disposal site shall not be allowed to flow through potentially sensitive wetlands to the south and west of the site.
- Any dredging project proponent must demonstrate that the dredged material disposal will not preclude present or future water-dependent use at the site.
- The western boundary of the site shall be leveed to prevent dredge materials from entering the intertidal area west of the site.

Page 3, Wetland Fill. While the County's Comprehensive Plan sets forth a goal exception for the potential fill of the wetland for industrial uses, it does not permit the fill in advance of an approved permit for industrial use. Any proposal to fill the wetlands requires an approved permit for industrial development.

Page 3, Quarry. The applicant and property owner shall acquire all necessary county and State permits if extraction is to resume at the Bradwood rock quarry.

Page 3, Existing Buildings. If the proponent desires to remove the existing buildings, demolition permits will be required from the Clatsop County Building Codes Division.

Page 4, Public or Private Conservation Land. The report states that the Bradwood site is not among the scenic sites designated in Clatsop County's Comprehensive Plan. However, the proponent should note that the rocky bluffs discussed on this page are the "Bradwood Cliffs" identified as a Scenic and Natural Area in the Clatsop County Northeast Community Plan. The plan describes the cliffs as follows, "The area consists of 40 acres of old growth Douglas Fir forest standing on basalt ledge overlooking the Columbia River. This stand is highly natural and the old trees will continue to constitute a viable natural ecosystem if left alone. The steep rocky slopes could not tolerate logging."

Page 4, Areas of Environmental Sensitivity. The proponent's report goes on to state that, "there are no designated protected habitats, nor areas of environmental sensitivity...within .25 miles of the Terminal site. This statement is a mischaracterization of the site and surrounding land. The site does contain several areas of environmental sensitivity including wetlands, old growth forest (see previous comments relating to Bradwood Cliffs) and the Columbia River

Estuary. The report also neglects to identify the Bradley State Wayside, a State Park, located near the top of Clatsop Crest approximately 1.5 miles from the Terminal site. Bradley State Wayside offers a sweeping vista of the Columbia River and surrounding miles of countryside.

Page 5, Flood Control Lands. The proponent's report states that the Terminal and accompanying facilities are above the 100-year floodplain. According to the Flood Insurance Rate Map for Clatsop County (Community Panel Number 410027 0014 A), portions of the site are located within Zone A3 (within the 100-year flood, base flood elevation has been determined to be 10' elevation). Other areas of the site are within Zone B (areas between the limits of the 100-year and the 500-year flood). This information is correctly identified in the proponent's Resource Report 2 (Page 9). Note that the proponent should request a Letter of Map Amendment (LOMA) or Letter of Map Revision (LOMR) from FEMA to establish the site as outside the 100-year flood based on fill activities that have taken place. Until the map correction is made by FEMA, the site will continue to be mapped as is.

Page 5, Coastal Zone Management Area. The proponent has correctly identified the site to be within the Coastal Zone Management Area. However, the applicant does not address the special issues associated with the CZMA. Simply stating that the, "applicant has begun discussions with DLCD concerning the consistency determination process, and expects to be consistent with the Oregon Coastal Management Program" is insufficient. As representatives from OCMP have repeatedly pointed out in correspondence and meetings with the applicant, the federal Coastal Zone Management Act requires listed federal licenses to be consistent with the mandatory enforceable policies of the OCMP. These policies include: 1) applicable statewide planning goals; 2) applicable city or county comprehensive plan and land use regulation requirements that have been approved by the Land Conservation & Development Commission; and 3) applicable state agency authorities that are part of the federally approved coastal management program. OCMP staff has accurately and thoroughly explained the implications of the Coastal Zone Management Act as it relates to development of the Bradwood Site for a LNG terminal to the applicant on numerous occasions. For that reason, the County will not duplicate the information that has been transmitted by OCMP staff. However, the County would like to emphasize the following points:

- Applicable Plan and land use regulations of the Clatsop County Comprehensive Plan, Clatsop County Land and Water Development and Use Ordinance, Standards Document and the Columbia River Estuary Management Plan regulate development at Bradwood.
- Consistency with the Coastal Zone Management Act is dependant on the applicant satisfying the land use regulations of the above referenced documents.

Page 5, Uses in the MI Zone. Water-dependent industrial and port uses are permitted in the MI zone. The applicant should be aware that specific standards apply to permitted development. These standards are described in Section 3.634 of the Clatsop County Land and Water Development and Use Ordinance.

Page 5, Activities in the F-80 Zone. The applicant states that 3.7 acres of land zoned F-80 will be used for temporary construction "lay-down". Temporary construction staging areas are not permitted within the F-80 zone.

Page 6, Uses in the AN and AC-2 zones. The applicant states that certain proposed uses are permitted in the AN and AC-2 zones, but that other proposed uses are not permitted in these zones. A complete report should identify specific uses proposed for each zone. The report goes on to state "Exceptions to allow uses that are otherwise unpermitted are anticipated by Statewide Land Use Goal 2 and allowed where appropriate reasons justify the exception." This statement seriously understates the process and scrutiny involved in requesting and granting a goal exception. Goal exceptions are processed as an amendment to the County's Comprehensive Plan and because the Plan is acknowledged by the State, the goal exception must satisfy Statewide Planning Goal 2 (please see attached) with ultimate approval by the State Department of Land Conservation and Development (DLCD). The bottom line is that goal exceptions are not taken lightly by the County or the State.

The applicant should note that an Exception to Goal 16 has already been taken for the Bradwood site. The goal exception places the former mill pond (wetland) into an Aquatic Development (AD) zone designation and ultimately anticipates the filling of the pond for an industrial use. The exception allows for lateral expansion of the existing dock and dredging to provide navigational access along the face of the existing dock and future new docks within the AD zone. **The Goal 16 exception specifically states that it does not permit any new dock construction or new dredging projects in Aquatic areas.**

Page 6, 45-Acre Dredge Area. As mentioned previously, the bulk of the 45-acre dredge area is zoned AC-2. Dredging associated with development is not permitted in the AC-2 zone. A change to this land use designation will require a Zone Change, Comprehensive Plan Amendment and Goal Exception.

Page 6, Wetland Fill. The applicant states that it would be appropriate to fill the former log pond for industrial development. This is supported by the Clatsop County Goal 16 Exception, as discussed previously. However, any fill of the pond will continue to require applicable permits from the State Division of State Lands and the US Army Corps of Engineers. Further, the filling of the former log pond will not be approved by the County without an associated permit approval for an industrial development. Other wetland fill also will require County permit approval in addition to State and Federal permits. Fill of any wetlands in the

Aquatic Natural Zone (AN) raises the same issues as dredging in the AC-2 zone. The use is not permitted, therefore, if the applicant wishes to fill these areas, they will need to apply for a Zone Change, Comprehensive Plan Amendment and a Goal Exception would need to be taken.

Page 6 & 7, Visual Impacts. The report discusses that the Bradwood Terminal is visible from few developed areas. The report also acknowledges that the Terminal would be visible from vessels on the river. This is an important point that merits underscoring. The recreation activities associated with the Columbia River are an important component of Clatsop County's economic base. The County's reliance on tourism is ever increasing as natural resource industries (i.e. timber, commercial fishing) struggle. Recreational fishing and boat tours (small craft such as kayak outfitters and large sternwheeler tours) utilize this reach of the River and the visual impact of a large-scale industrial use at this site is unquantifiable. Clatsop County also has serious concerns about the visual impacts on our neighbors across the River in Wahkiakum County, Washington.

Page 7, Unique and Scenic Resources. The Report states that the Bradwood site is not a unique or scenic resource designated by Clatsop County or the State of Oregon. However, the applicant neglects to mention that the Bradwood Cliffs are identified as a Scenic and Natural Area in the Clatsop County Northeast Community Plan. In the context of the previous paragraph, the proposed development, and in particular, the 168-foot high tanks has the potential to impact views of the cliffs, the old growth forest and wildlife (i.e. raptors) from those using the River.

Page 8, Lighting Impacts. The County appreciates the applicant's suggestion to work together toward a responsible lighting scheme. Lighting at this remote location will have impacts on both humans and wildlife and should be designed with the utmost consideration.

Page 8, Construction Activities. The applicant indicates that construction activities will generally occur during the weekday, daytime hours, but that dredging may occur on a 24-hour basis. The applicant should take note of the County's Noise Control Ordinance No. 2001-11 in consideration of the nearby residences in Clatsop and Wahkiakum Counties.

Oregon's Statewide Planning Goals & Guidelines

GOAL 2: LAND USE PLANNING

OAR 660-015-0000(2)

PART I -- PLANNING

To establish a land use planning process and policy framework as a basis for all decision and actions related to use of land and to assure an adequate factual base for such decisions and actions.

City, county, state and federal agency and special district plans and actions related to land use shall be consistent with the comprehensive plans of cities and counties and regional plans adopted under ORS Chapter 268.

All land use plans shall include identification of issues and problems, inventories and other factual information for each applicable statewide planning goal, evaluation of alternative courses of action and ultimate policy choices, taking into consideration social, economic, energy and environmental needs. The required information shall be contained in the plan document or in supporting documents. The plans, supporting documents and implementation ordinances shall be filed in a public office or other place easily accessible to the public. The plans shall be the basis for specific implementation measures. These measures shall be consistent with and adequate to carry out the plans. Each plan and related implementation measure shall be coordinated with the plans of affected governmental units.

All land-use plans and implementation ordinances shall be adopted by the governing body after

public hearing and shall be reviewed and, as needed, revised on a periodic cycle to take into account changing public policies and circumstances, in accord with a schedule set forth in the plan. Opportunities shall be provided for review and comment by citizens and affected governmental units during preparation, review and revision of plans and implementation ordinances.

Affected Governmental Units --

are those local governments, state and federal agencies and special districts which have programs, land ownerships, or responsibilities within the area included in the plan.

Comprehensive Plan -- as defined in ORS 197.015(5).

Coordinated -- as defined in ORS 197.015(5). Note: It is included in the definition of comprehensive plan.

Implementation Measures -- are the means used to carry out the plan. These are of two general types: (1) management implementation measures such as ordinances, regulations or project plans, and (2) site or area specific implementation measures such as permits and grants for construction, construction of public facilities or provision of services.

Plans -- as used here encompass all plans which guide land-use decisions, including both comprehensive and single-purpose plans of cities, counties, state and federal agencies and special districts.

PART II -- EXCEPTIONS

A local government may adopt an exception to a goal when:

(a) The land subject to the exception is physically developed to the extent that it is no longer available for uses allowed by the applicable goal;

(b) The land subject to the exception is irrevocably committed to uses not allowed by the applicable goal because existing adjacent uses and other relevant factors make uses allowed by the applicable goal impracticable; or

(c) The following standards are met:

(1) Reasons justify why the state policy embodied in the applicable goals should not apply;

(2) Areas which do not require a new exception cannot reasonably accommodate the use;

(3) The long-term environmental, economic, social and energy consequences resulting from the use of the proposed site with measures designed to reduce adverse impacts are not significantly more adverse than would typically result from the same proposal being located in areas requiring a goal exception other than the proposed site; and

(4) The proposed uses are compatible with other adjacent uses or will be so rendered through measures designed to reduce adverse impacts.

Compatible, as used in subparagraph (4) is not intended as an absolute term meaning no interference or adverse impacts of any type with adjacent uses.

A local government approving or denying a proposed exception shall set forth findings of fact and a statement of reasons which demonstrate that the

standards for an exception have or have not been met.

Each notice of a public hearing on a proposed exception shall specifically note that a goal exception is proposed and shall summarize the issues in an understandable manner.

Upon review of a decision approving or denying an exception:

(a) The commission shall be bound by any finding of fact for which there is substantial evidence in the record of the local government proceedings resulting in approval or denial of the exception;

(b) The commission shall determine whether the local government's findings and reasons demonstrate that the standards for an exception have or have not been met; and

(c) The commission shall adopt a clear statement of reasons which sets forth the basis for the determination that the standards for an exception have or have not been met.

Exception means a comprehensive plan provision, including an amendment to an acknowledged comprehensive plan, that;

(a) Is applicable to specific properties or situations and does not establish a planning or zoning policy of general applicability;

(b) Does not comply with some or all goal requirements applicable to the subject properties or situations; and

(c) Complies with standards for an exception.

PART III -- USE OF GUIDELINES

Governmental units shall review the guidelines set forth for the goals and either utilize the guidelines or develop alternative means that will achieve the

goals. All land-use plans shall state how the guidelines or alternative means utilized achieve the goals.

Guidelines -- are suggested directions that would aid local governments in activating the mandated goals. They are intended to be instructive, directional and positive, not limiting local government to a single course of action when some other course would achieve the same result. Above all, guidelines are not intended to be a grant of power to the state to carry out zoning from the state level under the guise of guidelines. (Guidelines or the alternative means selected by governmental bodies will be part of the Land Conservation and Development Commission's process of evaluating plans for compliance with goals.)

GUIDELINES

A. PREPARATION OF PLANS AND IMPLEMENTATION MEASURES

Preparation of plans and implementation measures should be based on a series of broad phases, proceeding from the very general identification of problems and issues to the specific provisions for dealing with these issues and for interrelating the various elements of the plan. During each phase opportunities should be provided for review and comment by citizens and affected governmental units.

The various implementation measures which will be used to carry out the plan should be considered during each of the planning phases.

The number of phases needed will vary with the complexity and size of the area, number of people involved, other governmental units to be

consulted, and availability of the necessary information.

Sufficient time should be allotted for:

- (1) collection of the necessary factual information
- (2) gradual refinement of the problems and issues and the alternative solutions and strategies for development
- (3) incorporation of citizen needs and desires and development of broad citizen support
- (4) identification and resolution of possible conflicts with plans of affected governmental units.

B. REGIONAL, STATE AND FEDERAL PLAN CONFORMANCE

It is expected that regional, state and federal agency plans will conform to the comprehensive plans of cities and counties. Cities and counties are expected to take into account the regional, state and national needs. Regional, state and federal agencies are expected to make their needs known during the preparation and revision of city and county comprehensive plans. During the preparation of their plans, federal, state and regional agencies are expected to create opportunities for review and comment by cities and counties. In the event existing plans are in conflict or an agreement cannot be reached during the plan preparation process, then the Land Conservation and Development Commission expects the affected government units to take steps to resolve the issues. If an agreement cannot be reached, the appeals procedures in ORS Chapter 197 may be used.

C. PLAN CONTENT

1. Factual Basis for the Plan

Inventories and other forms of data are needed as the basis for the policies and other decisions set forth in the plan. This factual base should include data on the following as they relate to the goals and other provisions of the plan:

- (a) Natural resources, their capabilities and limitations
- (b) Man-made structures and utilities, their location and condition
- (c) Population and economic characteristics of the area
- (d) Roles and responsibilities of governmental units.

2. Elements of the Plan

The following elements should be included in the plan:

- (a) Applicable statewide planning goals
- (b) Any critical geographic area designated by the Legislature
- (c) Elements that address any special needs or desires of the people in the area
- (d) Time periods of the plan, reflecting the anticipated situation at appropriate future intervals.

All of the elements should fit together and relate to one another to form a consistent whole at all times.

D. FILING OF PLANS

City and county plans should be filed, but not recorded, in the Office of the County Recorder. Copies of all plans should be available to the public and to affected governmental units.

E. MAJOR REVISIONS AND MINOR CHANGES IN THE PLAN AND IMPLEMENTATION MEASURES

The citizens in the area and any affected governmental unit should be given an opportunity to review and

comment prior to any changes in the plan and implementation ordinances. There should be at least 30 days notice of the public hearing on the proposed change.

1. Major Revisions

Major revisions include land use changes that have widespread and significant impact beyond the immediate area, such as quantitative changes producing large volumes of traffic; a qualitative change in the character of the land use itself, such as conversion of residential to industrial use; or a spatial change that affects large areas or many different ownerships.

The plan and implementation measures should be revised when public needs and desires change and when development occurs at a different rate than contemplated by the plan. Areas experiencing rapid growth and development should provide for a frequent review so needed revisions can be made to keep the plan up to date; however, major revisions should not be made more frequently than every two years, if at all possible.

2. Minor Changes

Minor changes, i.e., those which do not have significant effect beyond the immediate area of the change, should be based on special studies or other information which will serve as the factual basis to support the change. The public need and justification for the particular change should be established. Minor changes should not be made more frequently than once a year, if at all possible.

F. IMPLEMENTATION MEASURES

The following types of measure should be considered for carrying out plans:

1. Management Implementation Measures

(a) Ordinances controlling the use and construction on the land, such as building codes, sign ordinances, subdivision and zoning ordinances. ORS Chapter 197 requires that the provisions of the zoning and subdivision ordinances conform to the comprehensive plan.

(b) Plans for public facilities that are more specific than those included in the comprehensive plan. They show the size, location, and capacity serving each property but are not as detailed as construction drawings.

(c) Capital improvement budgets which set out the projects to be constructed during the budget period.

(d) State and federal regulations affecting land use.

(e) Annexations, consolidations, mergers and other reorganization measures.

2. Site and Area Specific Implementation Measures

(a) Building permits, septic tank permits, driveway permits, etc; the review of subdivisions and land partitioning applications; the changing of zones and granting of conditional uses, etc.

(b) The construction of public facilities (schools, roads, water lines, etc.).

(c) The provision of land-related public services such as fire and police.

(d) The awarding of state and federal grants to local governments to provide these facilities and services.

(e) Leasing of public lands.

G. USE OF GUIDELINES FOR THE STATEWIDE PLANNING GOALS

Guidelines for most statewide planning goals are found in two sections-planning and implementation. Planning guidelines relate primarily to the process of developing plans that incorporate the provisions of the goals. Implementation guidelines should relate primarily to the process of carrying out the goals once they have been incorporated into the plans. Techniques to carry out the goals and plans should be considered during the preparation of the plan.

FROM: Catie Fernandez, Coastal Planner

SUBJECT: Comments to Northern Star's Draft Dredged Material Placement and Management Plan

Northern Star Natural Gas (NSNG) has submitted a draft Dredged Material Placement and Management Plan to FERC as part of the NEPA pre-filing process. CREST staff has reviewed the draft document on behalf of the County and prepared the following summary and comments.

First, it is understood that the Dredged Material Placement and Management Plan is a draft and subject to further revisions. Additionally, should the County desire, the comments may be provided to the State of Oregon DOE as a coordinating agency or to FERC, as the County sees appropriate.

To summarize, the purpose of the NSNG's Draft Dredged Material Placement and Management Plan is to 1) define the project's dredging requirements (i.e. volume & area); 2) identify suitable methods; and, 3) identify suitable disposal locations.

NSNG will be seeking to dredge a turning basin in the Columbia River adjacent to the Bradwood site that can accommodate LNG ship operations. The dredge area is proposed to be approximately 58 acres with a depth of -43 feet (including overdredge allowance) for a total volume of approximately 681,000 cubic yards of material to be removed. Maintenance dredging requirements are estimated to be 150,000 cubic yards every five to ten years.

CREST has no comment regarding whether the dimensions are appropriate to accommodate LNG carriers. However, the issue as to whether the site is appropriately zoned remains unresolved. The location proposed to be dredged is zoned AC-2 (Aquatic Conservation-Two) and dredging is not a permitted use in this zone. More discussion regarding the process and appropriateness of rezoning, Comprehensive Plan Amendment and Goal Exceptions were provided to FERC by the County in previous comments to the draft terminal reports.

The NSNG Dredged Material Placement and Management Plan evaluates disposal options, including upland sites, open water placement, ocean disposal and beach nourishment. To summarize the Plan's conclusions, disposal at the existing Bradwood site is most desirable, although there may be capacity issues. Flow lane disposal, beach nourishment at Puget Island and filling of scour holes at locations such as Pancake Point and Welcome Slough in Wahkiakum County are considered potential options for disposal of excess materials that can not be accommodated at the Bradwood site.

CREST offers the following comments related to the disposal option analysis provided by NSNG. First, the capacity issue at the existing Bradwood site should be clarified. The Columbia River Dredged Material Management Plan (DMMP), which is adopted into the County's Comprehensive Plan identifies that the Bradwood Disposal Site (aka O-38.9) has a capacity of 420,000 cubic yards. The DMMP identifies that the site has already received materials, over ten years ago, but does not include a volume. Further, the DMMP notes that the capacity figure is the approximate cubic yard volume of the site based on surface area and disposal height. Therefore, with more analysis, NSNG may find there is capacity greater than or less than the 420,000 cubic yards identified in the DMMP. Upon construction of a terminal at the Bradwood site, NSNG will need to find alternate disposal sites for maintenance dredging.

In general, keeping sediment in the system for beneficial uses such as filling scour holes is positive. The NSNG plan makes the statement that, "The lower Columbia River is sediment deficient because upstream dams limit downstream movement of sediment. Consequently, addition of sediment in the lower Columbia River can benefit the environment". This statement could be supported by more substantial analysis, as the "sediment deficiency" issue has as much to do with how the sediment is distributed and its effects on habitat as the fact that less is being delivered from upriver sources.

Finally, a note about the dredging activity. It is understood that this report is primarily an analysis of disposal sites; however, additional hydrological studies commissioned by NSNG should address impacts associated with creation of the turning basin.

If you have any questions about the above comments or wish to discuss them in greater detail, please feel free to contact me.

CC: Patrick Wingard, Senior Planner

FROM: Catie Fernandez, Coastal Planner

SUBJECT: Addendum to Comments to Northern Star Natural Gas proposal to the Federal Energy Regulatory Commission for a liquid natural gas terminal at Bradwood.

This memo includes comments relating to the Bradwood Landing Resource Report 2, Water Use and Quality. Specifically, CREST has reviewed Resource Report 2 as it relates to wetland and wetland mitigation information.

In 2003, CREST prepared a wetland delineation at the Bradwood site for use by Clatsop County. This delineation received concurrence from Oregon Division of State Lands (DSL). CREST staff is familiar with the site wetlands and offers comments to Resource Report 2 based on this experience. The CREST wetlands delineation was utilized as one source of data by Bradwood Landing LLC/Northern Star Natural Gas in preparation of Resource Report 2.

General Comments: Compensatory Mitigation

A general overview was provided about the diversity of wetland classes in the area along with conceptual mitigation ideas. However at this time, it is difficult to provide comments without any specific details on what the actual mitigation activities will entail. This includes appropriate compensation for actual ecological function lost for each wetland type impacted by construction activities and the facility footprint itself. The resource report is correct in stating that this level of articulation will take place in the Joint Removal-Fill permit application. Estimates of acreages of each wetland type are given, but it would be valuable to articulate the approach to mitigate each wetland type at this juncture. For example, for estuarine wetland habitat types, applying HGM methods for tidal wetlands would be an appropriate framework to properly assess the functions associated to these unique wetlands. As the applicants are probably aware guidance has been developed by the State of Oregon for tidal wetlands that can be used to fit the specifics of this project.

Specific Comments: Compensatory Mitigation

The calculations given for required wetland mitigation ratios are not correct. What was provided are the ratios for freshwater wetlands. Given for the types of wetlands impacted by the project it is assumed that both freshwater and Estuary mitigation ratios would be applied using existing guidance. (OAR 141-085-0240 thru 0257).

Railroad Relocation:

The 30 foot buffer between the railroad tracks and Hunt Creek is not sufficient to comply with existing land use ordinance for Clatsop County (CLATSOP COUNTY STANDARDS DOCUMENT ORDINANCE 80-14, S4.237) According to Clatsop County standards, a minimum of 50 is required from non-aquatic vegetation. If this buffer cannot be feasibly accomplished because of construction activities, consultation with County staff should be conducted to develop a means to mitigate this impact.

We hope that the above information is helpful to you as you review this project. If you have any questions, or require any additional information, please feel free to contact CREST staff by phone or email.

RE: Comments on Bradwood Landing Proposal

ATTACHMENT 2

1100 Olney Avenue
Astoria, Oregon 97103

- Traffic and transportation issues have not been resolved as of this date
- Information discussed to date is incomplete
- We are awaiting the required Traffic Impact Study and Traffic Management Plan
- Clatsop County Public Works and Community Development has not seen a complete plan for the proposed parking lot - issues remain unresolved
- Clatsop County anticipates Bradwood Landing to be responsible 100% of mitigation caused by or due to the project
- Bradwood LNG and Clatsop County have not yet agreed as to needed actions to take place on Clifton Road to become suitable for this construction traffic
- Bradwood Landing needs to address how local residents will have access to driving Clifton Road during construction phase
- Bradwood Landing will need to restore Clifton Road back to County standards or agreed upon improvements at the end of the construction period
- All traffic management plans will be reviewed in a public meeting with the residents before the County approves plan
- All involved emergency services agencies will need to review traffic management plan and make recommendation, i.e., Fire Department, Sheriff Office, Ambulance Service

Public Works
Department

Once the Traffic Impact Study and proposed Traffic Management Plan is presented to the County, we would request reserving comment of our specific concerns until that time.

Bradwood Landing Needs to Address:

Clatsop County Sheriff Tom Bergin would like to register concerns about the increased volume of large truck traffic on US 30 from Astoria to the Svensen intersection. His concerns are the curves and no alternative route for detour if a major accident was to occur.

CP06-377-000

Dear Secretary Salas and Lieutenant Scheirman:

Please accept these comments filed by the City of Astoria, Clatsop County, Oregon in the above-referenced dockets.

The City of Astoria, Oregon is a municipality consisting of approximately 10 square miles in geographic jurisdiction located near the mouth of the Columbia River. Astoria is the largest city in Clatsop County with a year round population of 10,000. However, proposed development plans could increase our residential population to over 13,000 in the next several years. During the summer and early fall our tourism population increases considerably and that is likely to continue with the development of additional tourist attractions.

Included within or immediately adjacent to Astoria are a diverse number of private and critical government occupancies. Among these are Fort Stevens (Oregon's largest State Park), Astoria Regional Airport (Clatsop County's only commercial airport), Camp Rilea Armed Forces Training Center (Oregon's largest active military reservation), Columbia Memorial Hospital (the region's major healthcare facility), a 100-bed juvenile corrections facility, the Tongue Point Job Corps (supporting more than 500 students),

two major recreational and commercial fishing boat mooring basins, a commercial port, and various Coast Guard facilities.

Astoria and the greater Astoria area also has a variety of commercial and industrial establishments. Traditionally our industries have been fish and lumber related, but the largest employee base is service oriented, including government agencies and healthcare. Industrial examples include Bornsteins Seafood, a major fish processing plant, and Weyerhaeuser, the only major lumber mill in northwest Oregon. All of these major employers are located directly on or within a few hundred yards of the Columbia River.

Public Safety is provided by local police and fire departments. The Astoria Police Department is comprised of sixteen full-time officers and several reserve officers, who are responsible for twenty-four hour protection of the City's ten square mile area. The Astoria Fire Department consists of twelve full-time personnel, fifteen volunteer firefighters and five response vehicles. The Fire Department's service area is approximately twelve square miles and includes the numerous facilities noted above. The City has no marine law enforcement and limited marine firefighting capability.

The City has very limited funding resources available for public safety services. It relies on limited property tax revenues that are used primarily for personnel expenses. In recent years most public safety equipment purchases have depended on grants and loans.

The City's public safety responsibility extends for approximately seven miles along the southerly bank of the Columbia River beginning at approximately Buoy 31 then continuing eastward past Buoy 41. The Columbia River shipping channel defines the northern City limits and parallels the City for seven miles from the City of Warrenton past Tongue Point. Consequently, the City is directly and significantly impacted by the proposed vessel transits carrying liquefied natural gas ("LNG") to the proposed Northern Star Natural Gas LLC ("NSNG") facility at Bradwood Landing, located at approximately river mile ("RM") 38 upstream.

Astoria is the second municipality potentially impacted once the LNG Carrier enters the Columbia River. City representatives have had several meetings with the LNG project consultants and officers concerning the City's safety and security concerns as required by Section 311(d) of the Energy Policy Act of 2005. We respectfully request that City officials continue to be directly engaged in development of the required Emergency Response Plan and Waterway Suitability Assessment.

Specifically, because the Shipping Channel is located very close to the southwestern and southern bank of the Columbia River, a significant portion of the City's geography and water resources are located within the Zones of Concern identified in the United States Coast Guard's Guidance on Assessing the Suitability of a Waterway for Liquefied Natural Gas (LNG) Marine Traffic, NVIC 05-05 (the "NVIC"). Within these Zones of Concern are many areas where people congregate outdoors, including the full length of

the River Walk trail, the downtown commercial district, the Columbia River Maritime Museum, the area of the East and West Boat Basins, the businesses at North Tongue Point, the Tongue Point Job Corps campus, the Clatsop Community College Marine Environmental Research and Training Station, and several residential neighborhoods. Each of these businesses and public areas are sufficiently close to the vessel transit route to warrant heightened safety and security measures. Additionally, the majority of Astoria's population of 10,000 actually resides within one-half mile of the Shipping Channel.

Because of the large geographic area that makes up the City's jurisdiction and responsibility, during periods of vessel transits, under current staffing plans and procedures, the City may not have adequate police and fire resources to cover its entire area of responsibility in a manner which the City Council deems appropriate. Therefore, it is critical that City officials be involved in development of vessel transit operational procedures and the statutorily required Emergency Response Plan designed to address safety and security concerns, not only at the terminal site itself, but also along the vessel transit route, which includes the City of Astoria.

With regard to specific comments to resource Report No. 11 (Reliability and Safety) dated February 27, 2006, in addition to the FERC staff comments dated April 27, 2006, we have the following additional comments:

- Tugboats: FERC seeks information concerning the number and type of tugboats and a plan providing dedicated tug service. We think that as part of that submittal that FERC and/or the USCG should require a minimum of two (2) dedicated tugs, each with firefighting capability, including a deluge system and/or water curtain for protection of tug operators so that they may safely approach an LNG fire at a distance where the water cannons will be effective. Additionally, the tugs should be adequate to pull a disabled LNG Carrier out of the mouth of the Columbia River, in appropriate situations, in the event of an incident within or near the City of Astoria's jurisdiction.
- Pilots: We believe that it is imperative for the safe navigation along the vessel transit route, and within the City of Astoria's jurisdiction, that built-in redundancy exists for measures designed to provide positive vessel control, including pilots. Therefore, we recommend that at least two Columbia Bar Pilots be present on the ship at all times when traveling between the sea buoy, along the Astoria coast, and through the jurisdictional limits of the City.
- Marine law enforcement: As noted, the City does not currently possess any marine law enforcement assets, which are needed to supplement the USCG escorts, especially within the City's jurisdictional waters. The City intends to investigate potential funding sources, including federal Port Security Grants and is in the process of discussing marine law enforcement options with its neighbor, the City of Warrenton, and the Port Commission of Astoria.

- Fire response training/equipment: As noted, the City's fire department is dependent upon full time and volunteer firefighters. In the event of an LNG incident along the vessel transit route, and within the City's jurisdiction, these firefighters will be called on to assist (or may be called to cover other incidents within the City). It is imperative that these firefighters receive substantial additional training for these added duties and commitments. Specifically, we recommend that FERC and/or the USCG require the project proponent to fund such specialized LNG emergency response training, such as that offered by Texas Engineering Extension Service, a member of Texas A&M System, including mutually-agreeable compensation for the time the City's firefighters and volunteer firefighters missing work to attend such training. The current fireboat owned by the Port of Astoria and operated by the fire department is out-of-service because of its aging condition (over thirty-five years). A fireboat would be needed to provide adequate protection for waterfront properties along with firefighting efforts of any vessel carrying LNG. A "deep draft" fireboat that accompanies vessels that also operates as a tug is not suitable for waterfront fire protection.
- Cost-sharing plan: At a minimum, the City expects it will be fully compensated for the additional costs associated with added police, fire, and emergency response personnel during LNG vessel transits. Given the extensive waterfront area open to the public where people assemble outdoors, the City anticipates the possibility of additional police and fire resources pre-stationed and "on alert" during the LNG vessel transits through the City limits for approximately 125 vessel calls per year (as estimated by NSNG). Police and fire officers may also be needed at the Command Center to coordinate any response. Additional equipment, including communications gear, capable of communicating with all relevant stakeholders and officials, additional fire turn-out gear, high expansion foam generating engine, mobile command center, etc may also be required.

The City asks for the opportunity to discuss its specific needs with appropriate personnel from FERC, USCG and NSNG, all of whom are charged with coordinating these requirements.

Thank you for the opportunity to comment. We look forward to further discussion and coordination on these issues.

Sincerely,

THE CITY OF ASTORIA

Dear Ms. Van Horn:

Enclosed is a copy of a May 24, 2006 letter the Warrenton City Commission sent to the Federal Energy Regulatory Commission and the U.S. Coast Guard. It is regarding the Northern Star Natural Gas proposal concerning LNG vessel transits through the City of Warrenton.

It would be appreciated if you would include this letter in the Oregon Department of Energy's comments to FERC.

Thank you for your consideration. Please let me know if you have any questions.

Very truly yours,

Edward C. Madere
City Manager

Re: Northern Star Natural Gas LLC
Docket No. PF05-10-000

Re: Northern Star Natural Gas LLC
Docket No. CGD13-05-017

Dear Secretary Salas and Lieutenant Scheirman:

Please accept these comments filed by the City of Warrenton, Clatsop County, Oregon in the above-referenced dockets. The Warrenton City Commission the duly-elected governing body for the City of Warrenton, authorized me, the Mayor, to make this filing at its regular public meeting on May 23, 2006.

The City of Warrenton, Oregon is a municipality consisting of approximately 18 square miles in geographic jurisdiction located at the mouth of the Columbia River. It is the most northwesterly City in Oregon. The former Town of Hammond is merged into Warrenton. The City's year round population is currently 4,300, however based on proposed development plans this is expected to increase to over 7, 000 in the next several years. The summer time population can exceed 10,000 because of recreation activities in the City.

Included within or immediately adjacent to Warrenton are a diverse number of private and critical government occupancies. Among these are Fort Stevens (Oregon's largest State Park), Warrenton-Astoria Regional Airport (Clatsop County's only commercial airport), Camp Rilea Armed Forces Training Center (Oregon's largest active military reservation), a 100 bed juvenile corrections facility, and two major recreational and commercial fishing boat mooring basins.

Warrenton also has a variety of commercial and industrial establishments. Businesses range from small mom and pop stores to Fred Meyer, Costco, and Walgreens. Industries tend to be fish and lumber related and employ many people from the community. Industrial examples include Pacific Coast Seafood, a major fish processing plant, and Weyerhaeuser, the only major lumber mill in northwest Oregon.

Public Safety is provided by local police and fire departments. The Warrenton Police Department is comprised of eight full-time officers and several reserve officers, who are responsible for 24 hour protection of the City's 18 square mile area. The Warrenton Fire Department consists of two full-time personnel, 32 volunteer firefighters, and seven response vehicles. The Fire Department's service area is 28 square miles and includes the numerous facilities noted above. The City has no marine law enforcement or firefighting capability.

The City has very limited funding resources available for public safety services. It relies on limited property tax revenues that are used primarily for personnel expenses. In recent years equipment purchases have depended on grants and loans.

The City's public safety responsibility extends for approximately seven miles along the southerly bank of the Columbia River beginning at approximately Clatsop Spit (Buoy 14) then continuing eastward to Smith Point. Approximately four and a half miles of the Columbia River shipping channel from Hammond Marina east to the Astoria city limits are within the City of Warrenton. As such, the City is directly and significantly impacted by the proposed vessel transits carrying liquefied natural gas ("LNG") to the proposed Northern Star Natural Gas LLC ("NSNG") facility at Bradwood Landing, located at approximately river mile ("RM") 38 upstream.

Warrenton is the first municipality potentially impacted once the LNG Carrier enters the Columbia River. Until May 22, 2006, the City had not been contacted by anyone from the project proponent or any contractors acting on its behalf to engage in discussion concerning the City's safety and security concerns as required by Section 311(d) of the Energy Policy Act of 2005. Please see attached email.

We understand from the filings made by NSNG, including most recently the draft Resource Report No. 11 (Reliability and Safety), that selected officials from selected jurisdictions have been involved since August 2005 in discussions to develop the required Emergency Response Plan and Waterway Suitability Assessment. However, none of those officials represent Warrenton's interests or needs. Therefore, we respectfully request that City officials be directly engaged in development of the required Emergency Response Plan and Waterway Suitability Assessment.

Specifically, because the Shipping Channel is located very close to the southwestern and southern bank of the Columbia River, from the sea buoy to the jurisdictional limits of the City, a significant portion of the City's geography and water resources are located within the Zones of Concern identified in the United States Coast Guard's Guidance on Assessing the Suitability of a Waterway for Liquefied Natural Gas (LNG) Marine Traffic, NVIC 05-05 (the "NVIC"). Within these Zones of Concern are many areas where people congregate outdoors including essentially the entire route from Fort Stevens State Park, along the River Walk trail, in the area of Hammond Boat Basin and at Carruthers Park. Each of these public assembly areas is sufficiently close to the vessel transit route to warrant heightened safety and security measures.

Additionally, because of the large geographic area which makes up the City's jurisdiction and responsibility, during periods of vessel transits, under current staffing plans and procedures, the

City may not have adequate police and fire resources to cover its entire area of responsibility in a manner which the City Commission deems appropriate. Therefore, it is critical that City officials be involved in development of vessel transit operational procedures and the statutorily-required Emergency Response Plan designed to address safety and security concerns, not only at the terminal site itself, but also along the vessel transit route, which includes the City of Warrenton.

With regard to specific comments to resource Report No. 11 (Reliability and Safety) dated February 27, 2006, in addition to the FERC staff comments dated April 27, 2006, we have the following additional comments:

- Tugboats: FERC seeks information concerning the number and type of tugboats and a plan providing dedicated tug service. We think that as part of that submittal that FERC and/or the USCG should require a minimum of two (2) dedicated tugs, each with firefighting capability, including a deluge system and/or water curtain for protection of tug operators so that they may safely approach an LNG fire at a distance where the water cannons will be effective. Additionally, the tugs should be adequate to pull a disabled LNG Carrier out of the mouth of the Columbia River, in appropriate situations, in the event of an incident within or near the City of Warrenton's jurisdiction.
- Pilots: We believe that it is imperative for the safe navigation along the vessel transit route, and within the City of Warrenton's jurisdiction, that built-in redundancy exists for measures designed to provide positive vessel control, including pilots. Therefore, we recommend that at least two (2) Columbia Bar Pilots be present on the ship at all times when traveling between the sea buoy, along the Warrenton coast, and through the jurisdictional limits of the City.
- Marine law enforcement: As noted, the City does not currently possess any marine law enforcement assets which are needed to supplement the USCG escorts, especially within the City's jurisdictional waters. The City intends to investigate potential funding sources, including federal Port Security Grants and is in the process of discussing marine law enforcement options with its neighbor, the City of Astoria, and the Port Commission of Astoria, with which it already has Mutual Aid Agreements.
- Fire response training: As noted, the City's fire department is dependant upon volunteer firefighters, ordinary citizens who voluntarily agree to put their lives at risk to help their fellow citizens. In the event of an LNG incident along the vessel transit route, and within the City's jurisdiction, these volunteers will be called on to assist (or may be called to cover other incidents within the City). It is imperative that these volunteers receive substantial, additional training, and compensation for these additional duties and commitments. Specifically, we recommend that FERC and/or the USCG require the project proponent to fund such specialized LNG emergency response training, such as that offered by Texas Engineering Extension Service, a member of Texas A&M System, (see course descriptions) <http://www.teex.com/teex.cfm?pageid=ESTIprog&area=ESTI&templateid=1536> including mutually-agreeable compensation for the time the City's volunteer firefighters miss work to attend such training.

- Cost-sharing plan: Although NSNG acknowledges its requirement to implement an appropriate cost-sharing plan, until May 22, 2006, the City had not been contacted to negotiate such a plan. At a minimum, the City expects it will be fully compensated for the additional costs associated with added police, fire, and emergency response personnel during LNG vessel transits. Given the extensive waterfront area open to the public where people assemble outdoors, the City anticipates the possibility of additional police and fire resources pre-stationed and "on alert" during the LNG vessel transits from the sea buoy to the Astoria-Megler bridge, and during the out-bound ballast voyages (which still contain LNG heel) for approximately 125 vessel calls per year (as estimated by NSNG). Police and fire officers may also be needed at the Command Center to coordinate any response. Additional equipment, including potentially communications gear, capable of communicating with all relevant stakeholders and officials, additional fire turn-out gear, high expansion foam generating engine, mobile command center, etc may also be required.

The City welcomes the opportunity to discuss its specific needs with appropriate personnel from FERC, USCG and NSNG, all of whom are charged with coordinating these requirements.

Thank you for the opportunity to comment. We look forward to further discussion and coordination on these issues.

Very truly yours,

Gilbert Gramson
Mayor

Edward,

I have left a message for you at the office, please call me when you get a chance.

The only issue I have with the letter is that it is now outdated. We would like to see the letter reflect that NSNG has contacted you and has promised to work closely with you. You may want to delay the letter being sent until we can develop a more official participation for you.

Please call me to discuss a few other items,

4 standing up here in the dark, but the reason is
18:38:08 5 by having it dark up here, the slides show
6 up -- show clearer. So, hopefully, you'll see
7 the slides and you'll hear me, and we'll find
8 the custodian, maybe after the slide show we'll
9 turn the lights on and actually see. One of
18:38:26 10 the artifices of coming to a new place that
11 you've never been before is figuring out light
12 switches and things like that.

13 I want to welcome you all here tonight.
14 Good evening, ladies and gentlemen. This is a
18:38:37 15 public meeting to take comments on the draft
16 Environmental Impact Statement or DEIS, issued
17 by the Federal Energy Regulatory Commission,
18 also referred to as FERC, F-E-R-C, or just the
19 Commission, for the Bradwood Landing liquefied
18:38:54 20 natural gas -- liquefied natural gas, often
21 abbreviated as LNG, and that's how I'll refer
22 to it for the rest of the meeting, for the
23 Bradwood Landing LNG project.

24 Let the record show that this meeting was
18:39:10 25 called to order at about -- my watch says 6:38
□

3

18:39:15 1 p.m., on Monday, November 5th, 2007, at
2 Clatskanie Middle/High School Auditorium, 471
3 S.W. Belair -- Belair Drive, Clatskanie, Oregon
4 97016.

18:39:37 5 My name's Paul Friedman, and I work in the
6 environmental branch of the Office of Energy
7 Projects, OEP, at the FERC. I am the
8 environmental team leader for the Bradwood

Public Meetings

1

PM1 RN-110507-FERC.txt
9 Landing LNG project for the FERC. On behalf of
18:39:54 10 the FERC, I would like to welcome you all here
11 tonight. You may notice that there is a court
12 reporter sharing the stage with me up here.

13 Robin, please wave.

14 She is transcribing this meeting. This is
18:40:08 15 so we can have an accurate record of tonight's
16 comments. Within a few weeks a copy of the
17 transcript will be placed in the public record
18 for this proceeding and will be available
19 through the Internet via the FERC's Web site.

18:40:22 20 We can switch slides now, Pat.

21 The FERC is an independent agency within
22 the U.S. Department of Energy. We regulate the
23 interstate transportation of electricity,
24 hydropower, and natural gas. The Commission is
18:40:41 25 regulated by five Commissioners appointed by

4

18:40:43 1 the President of the United States and approved
2 by the United States Congress. The FERC staff
3 are civil servants.

4 Next slide.

18:40:52 5 On June 5th, 2006, Bradwood Landing LLC
6 filed an application with the Federal Energy
7 Regulatory Commission requesting permission to
8 construct and operate an LNG import terminal
9 under Section 3 of the Natural Gas Act, or
18:41:08 10 abbreviated as NGA, in docket number
11 CP06-365-000. NorthernStar Energy LLC filed a
12 companion application or under section 7 of the
13 NGA under docket number CP06-366-000.

Public Meetings

1

PM1 RN-110507-FERC.txt
 Hereafter, I will refer to Bradwood
 18:41:36 15 Landing LLC and NorthernStar Energy LLC
 16 collectively as just NorthernStar since they
 17 are, in reality, two subsidiaries of the same
 18 company.
 19 Next slide. Pat, next slide.
 18:42:04 20 The FERC is the lead federal agency for
 21 this project, and we took the lead in producing
 22 the EIS in order to comply with the National
 23 Environmental Policy Act of 1969, better known
 24 as NEPA. Our EIS also summarizes activities
 18:42:21 25 relating to compliance with the Endangered
 □
 18:42:23 1 Species Act, the Magnuson-Stevens Fishery
 2 Conservation and Management Act, the Marine
 3 Mammal Protection Act, the National Historical
 4 Preservation Act, the Clean Water Act, Clean
 18:42:33 5 Air Act, and Coastal Zone Management Act.
 6 Next slide.
 7 As part of its decision-making process,
 8 the FERC considered environmental impacts of
 9 the project as disclosed in the EIS. The
 18:42:49 10 production of the DEIS was a collaborative
 11 effort involving FERC staff, a third-party
 12 contractor, which is Natural Resources Group --
 13 again, I'll refer to them as by their initials,
 14 NRG -- and cooperating agencies.
 18:43:05 15 Let me introduce some of the people here
 16 tonight who played major roles in writing the
 17 DEIS. Representing our environmental
 18 contractor, NRG, is Patricia Terhaar. Pat is

5

Public Meetings

1

K-5

PM1 RN-110507-FERC.txt
19 down there doing the slide show. And at the
18:43:19 20 back, at the sign-in table is, Janelle Rieland.
21 For those of you who live in this area, I want
22 to point out that Pat's mother was born and
23 raised in Longview, Washington. We consider
24 our contractors to be an extension of the FERC
18:43:33 25 staff.
□

6

18:43:39 1 The federal agencies that cooperated in
2 the production of the DEIS includes the U.S.
3 Army Corps of Engineers, the U.S. Coast Guard,
4 and the U.S. Department of Transportation. A
18:43:50 5 cooperating agency has jurisdiction by law or
6 special expertise related to project-specific
7 environmental impacts, and those agencies may
8 adopt the EIS to meet their own regulatory
9 obligations for compliance with the NEPA.

18:44:06 10 Next slide.
11 We issued a notice of availability, or
12 NOA, for the DEIS on August 17th, 2007, which
13 gave a closing date for comments as December
14 24th, 2007. The U.S. Environmental Protection
18:44:21 15 Agency noticed the issuance of our DEIS in the
16 Federal Register on August 24th, 2007.

17 Next slide.
18 We mailed almost 1300 copies of the DEIS
19 to various elected officials, federal, state,
18:44:39 20 and local governmental agencies, landowners,
21 and interested members of the public. In
22 addition, copies were sent to local newspapers
23 and libraries, and copies of the DEIS are

Public Meetings

1

K-6

PM1 RN-110507-FERC.txt
24 available at the public reference room at the
18:44:54 25 FERC in Washington, D.C., and can be viewed
□ 7

18:44:59 1 electronically on the FERC's Internet Web site
2 under the eLibrary link.
3 In addition, NRG will be receiving some
4 additional hard copies. So if you want a hard
18:45:09 5 copy, you may give your name and address to Pat
6 or Janelle, and they'll make sure they mail you
7 a copy.
8 The DEIS described the proposed action.
9 The purpose of the project is to provide a new
18:45:24 10 source of natural gas to the Pacific Northwest
11 by importing LNG. LNG is natural gas that has
12 been cooled to about minus 260 degrees
13 Fahrenheit for shipping and storage as a
14 liquid. It can be transported in specially
18:45:41 15 designed ships to its point of origin.
16 Next slide.
17 This is acknowledge LNG export facility, I
18 believe. This is in Alaska, and that's LNG
19 ship.
18:45:51 20 Next slide.
21 Another view of LNG ship.
22 In summary, the Bradwood Landing LNG
23 project would consist of the following key
24 elements:
18:46:04 25 An LNG import, storage, vaporization, and
□ 8

18:46:07 1 sendout facility located at Bradwood Landing in
2 Clatsop County, Oregon, about 38 miles up the
Page 6

Public Meetings

1

K-7

PM1 RN-110507-FERC.txt

3 Columbia River from its mouth.
4 The terminal would include a 58-acre
18:46:19 5 maneuvering area adjacent to the existing
6 Columbia River navigation channel, and a single
7 berth capable of handling LNG ships up to
8 2,000 -- up to 200,000 cubic meters in
9 capacity.
18:46:34 10 The waterway for LNG marine traffic would
11 extend from 12 nautical miles off the Oregon
12 coast, up the Columbia River to Bradwood
13 Landing. The upland portion of the terminal
14 would include two full-containment LNG storage
18:46:48 15 tanks with a capacity of 160,000 cubic meters
16 each.
17 Next slide.
18 A nonjurisdictional 1.5-mile-long,
19 115-kilovolt power line to be built, owned, and
18:47:02 20 maintained by PacifiCorp, that would extend
21 from the existing Bonneville Power
22 Administration system to the Bradwood Landing
23 LNG terminal. The LNG terminal would have a
24 maximum sendout capacity of 1.3 billion cubic
18:47:17 25 feet per day of natural gas.
□
18:47:18 1 Next slide.
2 A 36.3-mile-long natural gas sendout
3 pipeline would extend from the Bradwood Landing
4 LNG terminal to an intersection with the
18:47:30 5 existing Williams Northwest Pipeline
6 Corporation interstate natural gas system near
7 Kelso, Washington. This would include 18.9
Page 7

Public Meetings

1

PM1 RN-110507-FERC.txt

8 miles of 36-inch diameter pipeline across
9 portions of Clatsop and Columbia counties,
10 Oregon, and 17.5 miles of 30-inch pipeline
11 mostly in Cowlitz County, Washington.

12 Next slide.

13 Associated with the pipeline would be a
14 sendout meter station located within the LNG
15 terminal tract, four delivery meter stations,
16 and interconnections with the Georgia-Pacific
17 Wauna mill at milepost, or MP, 3.7, Northwest
18 Natural Pipeline at MP 11.4, PGE Beaver power
19 plant at milepost 18.9, and Williams Northwest
20 pipeline at milepost 36.3, six main line block
21 valves along the pipeline, pig launchers at the
22 terminal meter station and at the Beaver meter
23 station, and pig receivers at Beaver and
24 Williams Northwest meter stations.

18:48:29 25 Next slide.

10

18:48:31 1 Short, nonjurisdictional pipeline laterals
2 would be built, operated, and maintained by the
3 gas customers to interconnect with the
4 NorthernStar pipeline at Wauna mill, Northwest
18:48:42 5 Natural pipeline, and Beaver power plant.

6 I want to clarify that the Federal Energy
7 Regulatory Commission is not a sponsor of this
8 project. This is a project proposed by
9 NorthernStar. The FERC is a licensing or
10 regulatory body, and we take no position on
11 this project until after we have completed the
12 full review of NorthernStar's applications.

Page 8

Public Meetings

1

PM1 RN-110507-FERC.txt

13 Before the FERC makes a decision about the
14 project, there are several steps that must be
18:49:12 15 taken.

16 Next slide.

17 One of those steps includes public input.
18 So first we will consider comments from the
19 public on the DEIS, and that's the purpose of
18:49:27 20 tonight's meeting.

21 Because the Commission has the
22 responsibility to treat all parties to a
23 proceeding equally, we must first make sure
24 that our process is open and public. For this
18:49:37 25 reason, we are constrained by our own ex parte

11

18:49:41 1 rules. This means there can be no
2 off-the-record discussions or correspondence
3 between the FERC staff and interested parties
4 regarding the merits of this case. Therefore,

18:49:50 5 I encourage you to either speak tonight on the
6 record, or to send us your comments in writing.

7 Next slide.

8 You can use the Internet through the
9 FERC's Web page at www.ferc.gov to have access
18:50:08 10 to public records in this proceeding and to
11 post your comments. You may file -- you may
12 follow filings -- you may file -- you may
13 follow filings in this proceeding through the
14 FERC's eSubscription service. You may view all

18:50:22 15 filed documents of the public record through
16 our eLibrary link, and you may send comments in
17 electronically via our eFiling link, or you can
Page 9

Public Meetings

1

K-10

PM1 RN-110507-FERC.txt

18 18:50:38 send in written comments the old-fashioned way
19 through the U.S. mail. Written comments should
20 be sent to:

21 Kimberly D. Bose, Secretary.
22 Federal Energy Regulatory Commission.
23 888 First Street, Northeast, Room 1a.
24 Washington, D.C. 20426.

18:50:52 25 Please reference on anything you send to

12

18:50:54 1 us the docket numbers CP06-365 and CP06-366,
2 and send one original and two copies of these
3 written comments submitted. Label one copy for
4 the attention of the FERC Office of Energy
18:51:10 5 Projects, Division of Gas-Environment and
6 Engineering, Gas Branch 3, PJ-11.3, which is
7 our internal mail stop.

8 The FERC will address comments on the DEIS
9 in a final EIS, or FEIS. Copies of the FEIS
18:51:28 10 will be sent to all parties on our mailing
11 list.

12 After we have issued the FEIS, the FERC
13 staff will analyze both the environmental
14 impacts of proposed project and all
18:51:39 15 nonenvironmental issues, including markets and
16 rates. The FERC staff would then make
17 recommendations about the project to the five
18 Commissioners who head our agency. It is those
19 Commissioners who make the final decision about
18:51:53 20 whether or not to authorize this project.

21 Next slide, please.

22 If the FERC decides to approve the
Page 10

Public Meetings

1

K-11

PM1 RN-110507-FERC.txt

23 project, the Commissioners would issue an order
24 to NorthernStar. If the Commission issues a
18:52:07 25 Certificate of Public Convenience and Necessity
□

13

18:52:09 1 for the pipeline, under Section 7H of the NGA,
2 that certificate would convey to NorthernStar
3 the power of eminent domain for nonfederal and
4 nontribal lands along the pipeline route.

18:52:22 5 If NorthernStar is unable to negotiate an
6 easement agreement with property owners, it may
7 acquire its right-of-way of easement through
8 the local courts. We urge NorthernStar to
9 negotiate in good faith with all landowners to
18:52:37 10 reach agreements. The LNG terminal is under
11 Section 3 of the NGA, which does not include
12 the power of eminent domain.

13 It is likely that a Commission order
14 authorizing the project would include our
18:52:54 15 recommended environmental conditions as
16 outlined in the EIS. One of those conditions
17 in the DEIS is that NorthernStar should develop
18 and fund a third-party environmental monitoring
19 program to be implemented during construction.

18:53:09 20 In addition to this, the FERC staff will
21 also monitor the project through construction
22 and restoration, performing on-site inspections
23 for compliance with the environmental
24 conditions of the order, and the U.S.

18:53:21 25 Department of Transportation would also monitor
□

14

Public Meetings

1

K-12

18:53:23 1 PM1 RN-110507-FERC.txt
the project design and construction.
2 Next slide, please.
3 Other agencies must also issue various
4 permits before the project can go forward to
18:53:36 5 construction. The Coast Guard will issue a
6 letter of recommendation indicating whether or
7 not the waterway is suitable for LNG marine
8 traffic. The Corps of Engineers will issue a
9 permit under the Rivers and Harbors Act and
18:53:52 10 Section 404 of the Clean Water Act. The
11 Washington Department of Ecology and Oregon
12 Department of State Lands and Oregon Department
13 of Environmental Quality would issue permits
14 under Section 401 of the Clean Water Act.
18:54:06 15 The Oregon Department of Environmental
16 Quality would also issue a federally delegated
17 permit under the Clean Air Act, and the Oregon
18 Department Land Conservation and Development
19 would make a determination on whether or not
18:54:18 20 the project is consistent with the Coastal Zone
21 Management Act.
22 Let me emphasize that this meeting is not
23 a hearing on the merits of the NorthernStar
24 proposal. As I said earlier, the purpose of
18:54:29 25 this meeting tonight is to give you, the
□

18:54:32 1 public, an opportunity to comment on the draft
2 Environmental Impact Statement.
3 While you may want to declare that you are
4 either for or against this project, those kinds
18:54:41 5 of subjective statements are not particularly

15

Public Meetings

1

PM1 RN-110507-FERC.txt
 6 useful to the FERC staff when we have to do an
 7 environmental analysis. The type of comments
 8 that we do find useful are those that address
 9 data gaps in the DEIS or point out factual
 18:54:57 10 errors that need to be corrected. And we make
 11 those corrections in the final Environmental
 12 Impact Statement.
 13 Next slide.
 14 Before we take public comments, let's run
 18:55:07 15 through some general rules of decorum. I know
 16 that some of you find these issues to be
 17 extremely emotional, and I ask you to try to
 18 remain calm and present your views in a
 19 reasoned manner. Please show respect to all
 18:55:21 20 speakers. Do not interrupt or yell out from
 21 the audience, and wait patiently for your turn
 22 to speak.
 23 I will call speakers in the order that
 24 they are on the sign-up sheet. However, I do
 18:55:32 25 typically allow public officials to go first.

16

18:55:35 1 I will call several people up at a time so they
 2 can go up here in the front row and be ready to
 3 speak. Each speaker will be limited to three
 4 minutes, and if there's time at the end of the
 18:55:48 5 meeting, you may be allowed to speak for a
 6 second time. But if you have more to say than
 7 can be said in three minutes, I urge you to
 8 send in detailed written comments to the FERC.
 9 I'd like everyone to be civil, treat all
 18:56:08 10 speakers with respect. Personal attacks and

Public Meetings

1

K-14

PM1 RN-110507-FERC.txt
11 name-calling are not acceptable.
12 This is a meeting for you, the public, to
13 comment on the draft Environmental Impact
14 Statement. It is not a question-and-answer
18:56:25 15 forum. Because many of your concerns are
16 complex and the FERC staff would need to do
17 additional research before addressing those
18 issues in a final Environmental Impact
19 Statement, therefore I would not be able to
18:56:37 20 give you accurate or complete responses tonight
21 from the podium. However, I will answer
22 questions that I do know the answers to,
23 specifically questions relating to
24 administrative or process.
18:56:50 25 Before we start this hearing, I would --
18:56:53 1 before we start hearing from the speakers, I
2 suggest we take a short, five-minute break.
3 That will allow anyone who has not signed up to
4 go back to Janelle and signed up on the sign-up
18:57:05 5 sheet. So we'll take a five-minute break, and
6 we'll reconvene, and I'll call the speakers
7 from the list. Thanks.
8 (Recess.)
9 MR. FRIEDMAN: Okay. Thank you for
19:02:57 10 waiting. Now is -- I'll open the floor to
11 individual comments. I ask that each speaker
12 clearly state their name for the record, speak
13 clearly in the microphone, spell your name for
14 the transcriber, identify any organization that
19:03:13 15 you may represent. If you are a landowner

Public Meetings

1

K-15

PM1 RN-110507-FERC.txt
16 along the pipeline route, please indicate where
17 your property is located according to mile
18 marks, if you know them.
19 So the first speaker tonight is the mayor
19:03:27 20 of Clatskanie, Diane Pohl.
21 MS. DIANE POHL: Good evening, and thank
22 you for giving me this opportunity to welcome
23 the Federal Energy Regulatory Commission staff
24 and everyone else that has come to participate
19:03:51 25 in this process. I just wanted you to know

18

19:03:54 1 that the City of Clatskanie is delighted that
2 you're here. If we can be of any help while
3 you're here, please let us know. But welcome
4 to our community.

19:04:06 5 MR. FRIEDMAN: Thank you. And for those
6 of you who do not know, we're going to do
7 another meeting tomorrow morning at 9:00 a.m.
8 at the Clatskanie River Inn. So we'll do
9 actually two meetings here in Clatskanie.

19:04:19 10 I'm going to call three names, if I can
11 read them, and have those people ready to just
12 come up and speak. It's still dark in here
13 because we weren't able to figure out how to
14 turn the lights up.

19:04:45 15 We think the first speaker is Carol
16 Carver, Duncan MacKenzie is next, and then
17 Gayle Kiser. Remember that you are limited to
18 three minutes so everyone gets an opportunity
19 to speak.

19:05:14 20 MS. CAROL CARVER: Are you ready?

Public Meetings

1

K-16

PM1-1	21	PM1 RN-110507-FERC.txt	
	22	Mr. Friedman, FERC staff, in general, I'm	
	23	gravely concerned that many issues are simply	
	24	recommended in the DEIS and/or postponed for	
	25	accomplishment until well after the surveying	
	19:05:27	or the construction. For example, in section	19
	19:05:31	4.1 -- sorry -- 4.11.6, emergency response, the	
	2	emergency response plan, in our opinion, should	
	3	be completed and approved prior to issuing the	
	4	permit rather than, as written in the DEIS,	
	19:05:46	prior to initial site preparation.	
	5		
	6	FERC is considering approving a permit for	
	7	a large LNG facility that will be located	
	8	within a half mile of people's residences, not	
	9	to mention the maneuvering zone that will	
	19:05:59	follow the ship 38 miles up the river. The ERP	
	10	should be written and approved, including	
	11	evacuation plans, before permitting takes	
	12	place. FERC's use of the word "recommendation"	
PM1-2	13	should be in replaced by "shall." I really	
	14	think it needs to be stronger than a	
	15	recommendation.	
PM1-3	16		
	17	In section 4.11.4, thermal exclusion zone	
	18	is described using the on-land tanks as the	
	19	center from which distances are calculated.	
	19:06:26	FERC should also require that similar	
	20	calculations occur using a docked ship as the	
	21	center. Until the ship is offloaded and after	
	22	it is docked, it is, in effect, a storage tank	
	23	that is located much closer to the residences	
	24	on Puget Island than are the on-land storage	
	19:06:39		20
Page 16			

PM1-1 On March 24, 2008, NorthernStar filed a draft ERP with the FERC for review. As discussed in section 4.11.6, the ERP would need to be reviewed and approved by the FERC before any final approval to begin construction. NorthernStar would need to revise the draft ERP in response to the FERC's review, and after consultations with the Coast Guard; state, county, and local emergency planning groups; fire departments; state and local law enforcement; and other appropriate federal agencies.

PM1-2 The EIS is not a decision document. It is an advisory document disclosing potential environmental impacts of the proposed project. The FERC's environmental staff makes recommendations in the EIS using the phrasing "should." If the Commission adopts the EIS, in an Order authorizing the project, it may include the environmental conditions listed in Section 5 as requirements, using the term "shall."

PM1-3 Thermal exclusion zones for the onshore LNG tanks are calculated based on 49 CFR 193 and NFPA59A, 2001 edition. These regulations do not apply to LNG vessels and the methodologies could not be appropriately applied to an LNG vessel. Section 4.11.5.3 describes the methodologies and studies that the FERC uses to assess LNG spills from LNG vessels.

Public Meetings

1

K-17

PM1 RN-110507-FERC.txt

19:06:42 1 tanks.

PM1-4 2 Section 4.3.2.3, page 4-75, NorthernStar

3 references the City of Portland storm water

4 management manual for calculating storm water

19:06:55 5 runoff volumes. We have at least twice the

6 amount of rain as Portland. FERC should check

7 to be sure the rainfall is in the neighborhood

8 of 60 to 90 inches a year in the calculation

9 that was used and not Portland's rainfall.

PM1-5 19:07:08 10 Section 4.8.2.4, property values,

11 concludes that the presence of an LNG facility

12 does not have significant positive or negative

13 impact on property values. Why is the research

14 done by Clarkswell Bain, by Professor George

19:07:23 15 Tolley of the University of Chicago and RCF

16 Economic & Financial Consulting not quoted, in

17 which he finds a dramatic negative impact on

18 property values in proximity to the LNG

19 terminals?

PM1-6 19:07:39 20 Lastly, section 4.1.3.3, geologic hazards,

21 this section delineates that the soil will

22 liquify in the event of a large seismic event

23 to the depth of 85 feet. However, there's no

24 recommendation in relation to the soil level

19:07:55 25 actually dropping after such an event.

0

19:07:58 1 Professor Atwater at the University of

2 Washington has documented a three-foot drop in

3 soil levels very close to the Bradwood site

4 after the last major seismic event that

Page 17

21

PM1-4 As described in section 4.3.2.3, the Stormwater Management Plan was filed with the FERC as part of the JPA on November 22, 2006. Revisions to the JPA were filed on April 5, 2007. This document is available for viewing by the public on the FERC's internet web page at www.ferc.gov, through the eLibrary link, selecting "General Search," entering the docket number minus the last three digits (i.e., CP06-365), and putting in the proper date range. NorthernStar's Stormwater Management Plan is designed using rainfall amounts calculated at the Astoria Airport by the Western Regional Climate Center for 2006.

PM1-5 The referenced report by George Tolley and RCF Economic and Financial Consulting studied a proposed natural-gas-fired power plant in Libertyville, Illinois. The studies discussed in sections 4.8.2.3 and 4.8.3.3 in our EIS are analyses of the potential impacts of LNG terminals and pipeline projects on property values.

PM1-6 As discussed in section 4.1.3.3, the soils at the site, including the fill soils, would be treated using vibroflotation to minimize the potential for liquefaction and associated subsidence. NorthernStar would be required to comply with the seismic design requirements of NFPA 59 (2001) and the additional measures described in the FERC's Seismic Design Guidelines. Also see our response to comment SA1-4.

Public Meetings

1

K-18

PM1-6 cont'd

PM1 RN-110507-FERC.txt

19:08:10 5 occurred in the 1700s, which, by the way, he
6 feels we're long overdue for another one.
7 We would like to see in the DEIS what the
8 consequence of a three-foot drop in soil level
9 after soil liquefaction would be, and this is
19:08:25 10 not currently addressed in the DEIS. Also,
11 does the conclusion that soils will liquify to
12 85 feet include the fill that is planned for
13 this site?
14 Thank you.

19:08:41 15 MR. FRIEDMAN: Miss Carver, I want to
16 compliment you on those comments. Those are
17 the kind of comments we're looking for, very
18 specific in terms of resources, and comments
19 that we can address in the DEIS. I appreciate
19:08:53 20 those comments.
21 I want to make one clarification. You
22 asked about why we used the term "recommended"
23 and not the word "shall." Staff can only
24 recommend. The Commissioners will make the
19:09:03 25 final decision, and in the Commission order
□

19:09:05 1 you'll see the word "shall" replaced with the
2 word "recommend."
3 MS. CAROL CARVER: Thank you.
4 MR. FRIEDMAN: Next up to speak is Duncan
19:09:12 5 MacKenzie.
6 MR. DUNCAN MacKENZIE: Good evening. My
7 name is Duncan MacKenzie. M-A-C-K-E-N-Z-I-E.
PM1-7 8 Noted in the DEIS on page 4-346 and again
9 on 4-416 is the fact that the Portland
Page 18

22

PM1-7

As discussed in section 4.11.3, the "five foot impoundment dike" referenced in the comments is a tertiary earthen berm surrounding the facility. As shown in table 4.11.4-1, because the proposed storage tanks are full containment tanks, the "dike" for each tank would be its outer concrete wall, which would contain any spills from each storage tank. Any process related spills would be directed to and contained by the process area sump or tank area sump, not the tertiary earthen berm. Therefore, the applicable impoundment system that would fall under 49 CFR 193.2155 would be the outer concrete wall on the full containment tank. As referenced in section 4.11.4, section 4.8.2.7 of the final EIS has been updated to include a discussion on the adjacent railroad tracks.

Public Meetings

1

K-19

PM1 RN-110507-FERC.txt

PM1-7 cont'd

19:09:28 10 willamette railroad tracks are adjacent to the
11 facility. Also noted on page 4-111 and 4-112
12 is the provision of a five-foot impoundment
13 dike surrounding the LNG storage tanks.
14 The applicant's resource report 13,
19:09:41 15 section 13.13, details specific codes of
16 regulation that are applicable to aspects of
17 the terminal's physical design. On page 13-60
18 of resource report 13, the applicant notes
19 compliance with only one aspect of structural
19:09:54 20 requirements is found in 49 CFR 190.2155,
21 indicating that the LNG storage tanks cannot be
22 sited near an airport runway.
23 However, far more applicable aspect of
24 this site regulation is found in the paragraph
19:10:09 25 immediately prior to the one sited by the
□

19:10:13 1 applicant. 49 CFR 193.2155 (a) (5) (ii)
2 states: "The structural members of an
3 impoundment system must be designed and
4 constructed to prevent impairment of the
19:10:18 5 system's performance reliability and structural
6 integrity as a result of the following." And
7 under sub 5: "If applicable, the potential
8 impact and loading on the dike due to," under
9 sub (ii), "If the LNG facility adjoins the
19:10:35 10 right-of-way of any highway or railroad,
11 collision by or explosion of a train, tank car,
12 or tank truck that could reasonably be expected
13 to cause the most severe loading."
14 As seen in the proposed site plans, the
Page 19

23

Public Meetings

1

K-20

PM1-7
cont'd

PM1 RN-110507-FERC.txt

19:10:51 15 impoundment dike surrounding the LNG storage
16 tanks is directly adjacent to the railroad
17 right-of-way. However, not found in any of the
18 design criteria considerations for the
19 impoundment dike contained in the applicant's
19:11:02 20 resource reports one, 11, or 13, the DEIS or
21 any other publicly available materials does not
22 make any mention for the need to conform to the
23 requirements found in 49 CFR 193.2155 (a) (5)
24 (ii). While this information may appear in
19:11:20 25 table 13.13-1, this table has been designated
□

19:11:24 1 CEII and therefore is unavailable for public
2 review.
3 It is understood that the applicant's
4 design of the facility is not finished and that
19:11:33 5 the facility design must be compliant with the
6 applicable aspects of 49 CFR 193 and FNPA 59-A.
7 However, the apparent lack of acknowledgment or
8 appreciation for what seems to be a standard
9 safety requirements is most troubling. In view
19:11:45 10 of the needs to ensure public safety a request
11 for Commission review and comment is
12 appropriate in the FEIS or other documents
13 regarding this currently perceived lack of
14 address by the applicant to this specific
19:11:57 15 aspect.
16 MR. FRIEDMAN: Thank you, Mr. MacKenzie.
17 And, again, I appreciate your very detailed,
18 very specific comments on very specific
19 resource topics that we can address in the

24

Public Meetings

1

K-21

PM1 RN-110507-FERC.txt

19:12:11 20 DEIS.
21 Next speaker is Gayle Kiser. After
22 Mrs. Kiser -- having difficulty reading without
23 a light up here.
24 Gloria MacKenzie is up next. Sorry for
19:13:00 25 that delay. We're having trouble reading this.
□ 25

19:13:07 1 MS. GAYLE KISER: I am Gayle Kiser.
2 That's K-I-S-E-R.
3 (Reporter requests clarification.)
4 MS. GAYLE KISER: My written comments will
19:13:23 5 be submitted directly to FERC in Washington,
6 D.C., as they are too lengthy to address in the
7 three minutes that we have been given.

PM1-8 8 I find greatly inconsistency and
9 disappointment best describe this DEIS. Under
19:13:37 10 "inconsistency," we need an independent needs
11 assessment, not figures taken from industry-
12 friendly sources. The very fact that Northwest
13 Natural Gas just cut their gas rates to
14 residential customers should be a hint that we
19:13:49 15 don't need any more gas in the area.

PM1-9 16 Land use laws: By FERC's own reckoning,
17 the proposed project is not consistent with the
18 existing plans and guidelines that have been
19 established for land use development in the
19:14:02 20 project area. The professional planners hired
21 by Clatsop County agreed only to watch the
22 politically appointed commissioners on the
23 planning commission disagree. Take the word of
24 the professionals.

Page 21

PM1-8 The purpose and need discussion in section 1.1 has been expanded and includes a variety of sources.

PM1-9 Our discussion on local land use plans is included in section 4.7.2.2. On March 20, 2008, the Clatsop County Board of Commissioners made a final ruling accepting the land use changes proposed by NorthernStar for its Land Use Compatibility Statement process.

Public Meetings

1

K-22

PM1 RN-110507-FERC.txt

PM1-10 19:14:13 25 Alternatives have not been fully 26

19:14:15 1 developed. Why was the pipeline route through

2 Cowlitz County chosen? The Williams pipeline

3 is fully subscribed at this time. In the

4 Oregon JPA it is stated that the preferred

19:14:25 5 route would be to this storage area. We now

6 know of the Palomar pipeline proposal, which

7 would intersect the Bradwood Landing. It would

8 be appear that the Cowlitz routed is extraneous

PM1-11 9 at this time. Jobs have been promised, yet the

19:14:40 10 DEIS shows only 10 percent of the construction

11 jobs will come from Cowlitz and Wahkiakum

12 County.

PM1-12 13 Disappointments: We need to eliminate our

14 dependence on foreign fossil fuels. If we

19:14:53 15 don't move towards renewable fuels, we will

16 continue to be at the mercy of unfriendly

17 nations and we will continue down the path

18 toward catastrophic climate change. Section

19 3.1.1.2, entitled increased efficiency and

19:15:03 20 conservation of natural gas makes the title,

21 very title, sound like that's a bad idea.

PM1-13 22 Secrecy: The citizens of the affected

23 area deserve to know what is being done to

24 protect their safety. Instead, we are not

19:15:17 25 allowed to know what the emergency response 27

19:15:19 1 plan is in the event of an accident or

2 intentional attack on the pipeline, tankers, or

- PM1-10 Section 3.1.8 describes the factors that were considered when developing the route for the Bradwood Landing sendout pipeline. NorthernStar chose the route for its sendout pipeline, and the FERC staff reviewed it. NorthernStar's route in Cowlitz County attempted to follow the existing right-of-way for the KB Pipeline to the greatest extent possible. Regarding capacity of the Williams Northwest pipeline for the proposed new supplies, just because a pipeline is fully subscribed, that does not mean that pipeline capacity is never available for new entrants. It should be noted that for the last few years, LNG import terminals in the United States have been operating at about 50 percent capacity. Further, a significant amount of the volumes being imported are in the summer months when spare pipeline capacity is never available. Even in the winter months, and the shoulder seasons, capacity can be made available on "fully subscribed" pipelines through various Commission programs such as reverse open seasons, capacity turnbacks, capacity releases, and interruptible capacity. By encouraging the use of these programs, the Commission ensures that to the greatest extent possible, fully subscribed pipelines are fully utilized. In addition, the FERC has recently proposed new rules which would further aid in efficient use of available capacity by allowing asset managers to "tie" capacity released on a pipeline with gas supplies. As discussed in section 3.1.2.2, the proposed Palomar pipeline would not be a substitute for the proposed Bradwood Landing sendout pipeline; but can be viewed as a newly proposed system that would provide an alternative path for gas supplies to reach markets. See also our response to PM1-24.
- PM1-11 The number of construction workers presented in the draft EIS is an estimate and the specific number from Wahkiakum and Cowlitz Counties could be more.
- PM1-12 We have provided additional text to section 3.1.1.3 regarding renewable fuels and our evaluation of them as alternatives to the proposed project.
- PM1-13 The ERP is developed under consultation with appropriate federal, state, and local agencies. NorthernStar would be required to submit the ERP for review and written approval by the FERC before any final approval to begin construction. If the needed resources are not available and properly funded, operation of the project would not be approved. The draft ERP was filed on March 24, 2008. It can be viewed by the public through the FERC Internet webpage at www.ferc.gov. Go Dockets & Filings, click on eLibrary, put in the proper docket (CP06-365) and date, and look up Submittal 20080325-5040. Maps of the pipeline route are contained in Appendix B of the EIS. In addition, on October 30, 2007, the FERC streamlined its policy for critical energy infrastructure information (CEII) so that property owners on the pipeline route can obtain detailed alignment sheets with CEII for the portion of the project that would affect their land and the adjacent parcels on each side, without going through the CEII process.

Public Meetings

1

K-23

PM1-13 3 facilities. Indeed, we pipeline victims are
cont'd 4 not supposed to know if our property will be on
19:15:28 5 the final route. That's not right. Everyone
6 is left with uncertainty. Our government owes
7 its citizens more than that.

PM1-14 8 Effects on shipping: Our economy depends
9 a great deal on the commerce conducted on the
19:15:42 10 Columbia River. The WSA does not effectively
11 delineate what the effects of tanker traffic in
12 the shipping lane virtually every day will have
13 on our courts.

PM1-15A 14 Eminent domain: The idea our land be can
19:15:54 15 condemned and the pipeline installed over our
16 objections is abhorrent. This is a for-profit
17 company. They should not have the right to
18 take control of private property.

PM1-15B 19 Economic impacts on communities: Nowhere
19:16:07 20 is it delineated who will pay for the increased
21 security and safety measures that will be
22 mandated when LNG is sited in the area. State
23 and local governments will be expected to pick
24 up their end of the cost-sharing measure. How
19:16:19 25 much per tanker do we have to pay?

19:16:26 1 MR. FRIEDMAN: Thank you very much for
2 your comments.
3 The next speaker is Steve Dragich, and
4 after Steve, Vance Fraser.

19:16:55 5 MS. GLORIA MacKENZIE: Good evening,
6 Mr. Friedman and staff. My name is Gloria
7 MacKenzie. And it's M-A-C-K-E-N-Z-I-E.

28

- PM1-14 The LNG carriers would not affect ports along the Columbia River. As indicated in section 4.8.1.7, LNG marine traffic in the waterway would not significantly impact other commercial ship traffic.
- PM1-15A NorthernStar would make every effort to negotiate in good faith with affected landowners, but if an easement cannot be negotiated with a landowner and the project has been certificated by the FERC, NorthernStar may use the right of eminent domain in accordance with section 7(h) of the NGA. This law was passed by the U.S. Congress. The use of eminent domain as it relates to this project is discussed in section 4.7.3.1.
- PM1-15B As discussed in section 4.11.6, in accordance with EPAct 2005, NorthernStar's ERP is required to include a Cost-Sharing Plan identifying mechanisms for funding all project/specific security/emergency management costs that would be imposed on state and local agencies. In addition to the funding of direct transit-related security/emergency management costs, this comprehensive plan would include funding mechanisms for the capital costs associated with any necessary security/emergency management equipment and personnel base. The FERC staff is currently reviewing the draft ERP, and NorthernStar would not be able to start construction until after we find it acceptable. .

Public Meetings

1

K-24

PM1-16 8 PM1 RN-110507-FERC.txt
9 wind power is mentioned as an alternative
10 energy source in the DEIS. while wind power
19:17:10 11 represents only a portion of the total Pacific
12 Northwest energy portfolio, and requires load
13 sharing from other sources of energy, the
14 dismissive presentation of wind power in the
DEIS is incorrect. Two, it uses outdated
19:17:29 15 information. Three, does not address the
16 Pacific Northwest as a whole.
17 A far more balanced picture is found in
18 the Inner Governmental Northwest Power and
19 Conservation Council. In the Council's
19:17:47 20 document, the rule -- the role of renewable
21 resources in the fifth power plant dated 5
22 October 2006, quote: Over 2600 megawatts of
23 generating capacity of all resource types will
24 have been placed in service in the Northwest
19:18:07 25 between adoption of the fifth plan in summer
29
19:18:11 1 2004 and by the end of 2008. About 800
2 megawatts is operating, 960 megawatts under
3 construction, and 880 megawatts currently
4 scheduled for completion by the end of 2008,
19:18:29 5 about 1720 megawatts of the total of renewable
6 energy resources. Nearly all of this is wind
7 capacity. Over 99 percent.
8 From the foregoing, the 400 megawatt wind
9 power figure noted in the DEIS is incorrect.
19:18:52 10 Additionally, while the assertion made on page
11 3-4 of the DEIS that most electrical generation
12 is from natural gas-fired sources was true in

PM1-16 We have taken your comments into consideration, and modified section 3.1.1.3 of our final EIS to include data from the Northwest Power and Conservation Council's (2007) "Biennial Monitoring Report on the Fifth Power Plan."

Public Meetings

1

K-25

PM1-16
cont'd

13 PM1 RN-110507-FERC.txt
2003, this assertion is now incorrect by the
14 recent accelerated development of wind power
15 generation.
16
17 Noted in the introduction to the latest
18 Council's biannual monitoring report on the
19 fifth power plan dated January 5, 2007, the
20 plan -- quote: The plan found that the region
19:19:28 had a surplus of generating capability and the
21 need for new generation from coal or natural
22 gas likely would be -- would not occur until
23 after 2012, after the five-year action plan,
24 period, end quote.
19:19:46 25 And in summary, high energy prices,
□ 30
19:19:48 1 quote -- I'm sorry. High energy prices and
2 concerns about potential climate change policy
3 have also led to excessive development of wind
4 power in the Pacific Northwest. In the two
19:20:00 5 years since the Council adopted the fifth power
6 plan, new generation capacity and slow-demand
7 growth have increased the electrical supply
8 surface in the region, which further delays the
9 need for new generating capability.
19:20:17 10 In view of the above -- of the above, it
11 is requested that FERC and its contract
12 consultants reevaluate: One, the role of
13 alternative energy sources in relation to the
14 proposed -- proposed project using more
19:20:33 15 contemporary and regional data and, two, the
16 necessity for the proposed project in the first
17 place.

K-26

PM1-17	18	PM1 RN-110507-FERC.txt Thank you very much.	
	19	MR. FRIEDMAN: Thank you very much for	
	19:20:46 20	your comments.	
	21	Next I think we have Mr. Dragich.	
	22	MR. STEVE DRAGICH: Mr. Dragich,	
	23	D-R-A-G-I-C-H, representing the Dragich Trust.	
	24	I find it ironic tonight in your rules of	
	19:21:03 25	decorum that you want the landowners identified	31
	19:21:06 1	under milepost when under the FERC Commission's	
	2	own rules titled, Critical Energy	
	3	Infrastructure Information, these	
	4	identifications and pipeline routes are denied,	
	19:21:20 5	and it's been further pushed by the proponents,	
	6	through their attorney, VanNess & Feldman, for	
	7	the FERC Commission in Washington, D.C., that	
	8	they have submitted to the FERC Commission a	
	9	so-called privacy right, which the landowners	
	19:21:38 10	lists and the privacy for the pipeline routes	
	11	have been denied.	
	12	Yet, in the original filing by the	
	13	proponent in June of 2006, a full 514 names of	
	14	landowners, their tax records, and their legal	
	19:21:59 15	descriptions were filed with the original	
PM1-18	16	application, has been mentioned under your	
	17	rules through executive orders through the FERC	
	18	Commission, rules four -- executive orders four	
	19	through six. You've designated the emergency	
	19:22:17 20	response plan as CEII, and you've also	
	21	designated the water suitability assessment	
	22	CEII.	

PM1-17 The FERC works to strike a reasonable balance between the need to protect sensitive, private, and security-related information, with the need for public review and input, and responds to requests accordingly. MP locations along the pipeline are not a secret, and are provided on the maps in Appendix B. We ask landowners with specific environmental comments about potential project impacts to identify their parcel by MP so that we can address their concerns. Nor are the names of the landowners along the pipeline route a secret. NorthernStar filed a landowner list with the FERC to comply with our regulations at 18 CFR 157.69(d)(5). We provide a list of landowners in Appendix A; but without their addresses.

PM1-18 The FERC's requirements for filing CEII and privileged information can be found at 18 CFR 388.12.

PM1-19 23 PM1 RN-110507-FERC.txt
Since you've restricted all the
24 information to the public, including the
19:22:32 25 required forms under CEII and the Freedom of
□ 32
19:22:35 1 Information Act, to which this speaker has
2 submitted 94 Freedom of Information Acts to
3 federal agencies, the bulk of which were to
4 FERC, all of which have been denied, yet you
19:22:51 5 expect us to make an informed decision on any
6 environmental impacts on this proposal.
7 MR. FRIEDMAN: Thank you for your
8 comments.
9 I believe Vance Fraser is next. After
19:23:14 10 Vance, we have Marjorie Castle. And then --
11 Marjie Castle and then Daniel Serres.
12 MR. VANCE FRASER: Hello. My name is
13 Vance Fraser, f-R-A-S-E-R, a landowner.
14 I once heard a wise man say just because
19:23:35 15 you can do something doesn't mean you should.
16 Just because it's possible to build an LNG
17 facility at Bradwood doesn't mean it's the wise
18 thing to do. Actually, quite the opposite.
PM1-20 19 Since FERC is a federal agency, supposedly
19:23:46 20 concerned with national interests, how is it
21 wise to be sucking our economy dry, sending our
22 energy dollars overseas for imported energy and
23 likely to countries that fund terrorists that
24 kill our troops? Why not boost our own economy
19:24:02 25 and make our nation more secure by recycling
□ 33
19:24:06 1 those energy dollars here at home? Rather than
Page 27

PM1-19 See our response to comment PM1-18.

PM1-20 The purpose of this EIS is to analyze the environmental impacts of the proposed project, not to promote energy development in other regions.

Public Meetings

1

K-28

PM1 RN-110507-FERC.txt

PM1-20
cont'd

2 promoting development of LNG, why aren't we
3 promoting development of that 500 miles of
4 shale oil between Colorado, Utah, and Wyoming?

19:24:18 5 It wasn't that long ago that President Bush
6 stated that we import too much foreign energy.

PM1-21

7 How is it wise to drive out cheaper
8 Canadian and Rocky Mountain supplies for more
9 expensive LNG, which arrives by ship and can be
19:24:31 10 cut off at any time? How is it wise to make us
11 pay more for foreign LNG just because Northwest
12 Natural Gas wants it, when other pipeline
13 companies are more than willing to bring us
14 North American gas, like the existing Canadian
19:24:45 15 and Williams pipelines along with the new Rocky
16 Mountain pipeline coming our way? How is it
PM1-22 17 wise to import LNG when North American gas
18 won't be drying out seals, causing equipment
19 damage, and explosions like LNG gas has?

PM1-23 19:25:00 20 You are a regulator and are justifying the
21 damage and detrimental impacts to this region
22 due to the supposed need for LNG and are buying
23 into the NorthernStar's and Northwest Gas work
24 (inaudible). NorthernStar has claimed time and
19:25:16 25 again that the LNG gas is for the Northwest and
□

19:25:19 1 that we need it.
2 It is time once and for all to make them
3 prove it, and here is how: It's time to
4 actually regulate. Restrict all LNG that comes
19:25:30 5 into the Northwest to stay in the Northwest.
6 Limit the use of LNG gas to Oregon, Washington,
Page 28

34

PM1-21 As briefly explained in section 1.1, NorthernStar believes that it can import LNG to provide a new supply of natural gas for the Pacific Northwest, to compete with domestic supplies. This section also discusses Canadian and Rocky Mountain production of natural gas. Newly proposed pipelines to bring additional supplies of Canadian and Rocky Mountain gas to Oregon are discussed in section 3.1.2.2.

PM1-22 Natural gas from foreign produced LNG has to be made compatible with existing pipelines in the United States, and should not dry out seals. The Commission issued its Policy Statement on Provisions Governing Gas Quality and Interchangeability in Interstate Natural Gas Company Tariffs (Policy Statement, PL04-3-000) in 2006. Consistent with the Policy Statement, NorthernStar must ensure that the regasified LNG it delivers to interconnecting pipelines meets the gas quality and interchangeability standards of the interconnecting pipelines' tariffs.

PM1-23 As discussed in section 1.1, NorthernStar's target markets are in the Pacific Northwest, not California. A study by Wood Mackenzie Limited indicated that at a sendout rate of 1 Bcf/d about 50 percent of the natural gas from Bradwood Landing would go to Oregon customers, 30 percent to Washington, and less than 20 percent to Idaho.

Public Meetings

1

K-29

PM1-23
cont'd

PM1 RN-110507-FERC.txt

7 and Idaho, as well as any electrical generation
8 made from it. If NorthernStar is unwilling to
9 agree to this, then their whole premise is
10 false.
11 We don't need the LNG, and there's no
12 justification to delay other ships on the
13 river, no justification to lose port jobs in
14 the process, no justification to direct --
15 wreck the river for fishermen or recreation,
16 nor farms nor properties, and no reason to
17 bring in the terrorist taxi.
18 If FERC is unwilling to make these
19 restrictions, then FERC is aiding and abetting
20 foreign energy interests, and America is for
21 sale yet again. This whole community is filled
22 with people who think it is a waste of time to
23 come here to speak. If you truly want to know
24 their minds, put it to a vote.
19:26:25 25 Thank you. 35
□

19:26:27 1 MR. FRIEDMAN: Thank you for your
2 comments.
3 Next is Marjorie Castle.
4 MS. MARJORIE CASTLE: Marjorie Castle.
19:26:36 5 M-A-R-J-O-R-I-E, C-A-S-T-L-E. Landowner. I
6 can't tell you exactly where I am along the
7 pipeline route because that's CEII.
PM1-24 8 In the DEIS it states that you did not
9 consider the Palomar pipeline as part of this
10 application because it was directly -- not
11 directly tied to the application or mentioned
Page 29

PM1-24 As described in section 3.1.2.2 and based on information provided by Palomar during the FERC's Pre-filing review process, the main purpose of the Palomar pipeline is to bring Canadian and Rocky Mountain gas to the Portland, Oregon metropolitan area and the Willamette Valley, and compete with the Williams Northwest system, which currently is the only interstate pipeline having direct interconnections with Northwest Natural, the LDC for northwestern Oregon and southwestern Washington. In addition, a segment of the Palomar pipeline would interconnect with the proposed Bradwood Landing LNG terminal near Wauna, Oregon, and provide a second sendout pipeline that could bring new supplies of natural gas from imported LNG to the Portland metropolitan area and to the GTN mainline. The proposed Palomar pipeline would not be a replacement for the proposed Bradwood Landing sendout pipeline; but can be viewed as a newly proposed system alternative. As explained in our final EIS, the Palomar pipeline is considered to be a separate, independent project. The Bradwood Landing Project and Palomar are not inter-dependent. Even if Palomar is not authorized or constructed, the Bradwood Landing Project could still go forward. The Bradwood Landing Project has its own sendout pipeline that would connect its proposed LNG import terminal with the existing Williams Northwest interstate natural gas system near Kelso, Washington. The Palomar pipeline would merely offer NorthernStar another option to market its gas. Palomar is currently being reviewed under the FERC's Pre-filing process (in Docket No. PF07-13), and we intend to do a separate, free-standing, independent EIS for the Palomar Project, to analyze its potential environmental impacts. We have included some preliminary information about the potential environmental impacts of the Palomar pipeline, combined with the Bradwood Landing Project, under Cumulative Impacts in section 4.12 of this EIS.

Public Meetings

1

K-30

PM1 RN-110507-FERC.txt

PM1-24 12 in the application. However, quoting from
cont'd 13 NorthernStar natural gas's filing on 12/15/2006
14 to the SEC, it states: We have agreed with the
19:27:17 15 Northwest Natural Gas Company, Northwest
16 Natural, to coordinate the permitting of a
17 connecting pipeline under a consulting services
18 agreement, which also provides Northwest
19 Natural with a nonexclusive option to construct
19:27:28 20 and own the connecting pipeline rather the
21 pipeline.
22 It goes on to say that, simultaneously, we
23 are nearing completion of our negotiations with
24 Bradwood's pipeline partner, Northwest Natural,
19:27:44 25 for Northwest Natural to construct and own the
□ 36

19:27:48 1 Bradwood pipeline. If these negotiations
2 result in a definitive agreement, we anticipate
3 transferring to Northwest Natural any FERC
4 authorizations that we may have received that
19:27:59 5 are necessary for Northwest Natural to
6 construct and operate the pipeline; meaning
7 that, since December of 2006, in all
8 possibilities, Northwest Natural Gas has
9 purchased the Bradwood line -- the Bradwood
19:28:14 10 pipeline prior to it even be permitting.
11 It further says, through Northwest
12 Natural's transportation arrangements, gas from
13 Bradwood will have access to TransCanada GTN
14 pipeline, which runs from Kingsgate at the
19:28:30 15 Canadian border to Malin in Northern California
16 as well as markets in Nevada and Idaho. LNG
Page 30

Public Meetings

1

K-31

PM1-24
cont'd

PM1 RN-110507-FERC.txt

17 supplies only -- LNG suppliers owning LNG
18 terminal capacity in Bradwood will have access
19 to 9 billion cubic feet per day of natural gas
19:28:46 20 demand.
21 In addition to the Bradwood pipeline
22 application, we have recently submitted a
23 request for service to TransCanada and
24 Northwest Natural for their open season under
19:28:59 25 which they would construct, own, and operate a
□ 37

19:29:01 1 pipeline that would connect the terminal to
2 Williams Northwest at Molalla and TransCanada's
3 GTN pipeline near Madras.
4 This will provide Bradwood and other
19:29:13 5 shippers with gas transportation service from
6 the LNG terminal to the pipeline systems of
7 both the Northwest Pipeline Company and
8 TransCanada's GTN pipeline, which can deliver
9 approximately 2 billion cubic feet per day into
19:29:29 10 Northern California at the Malin-Oregon
11 interconnect point.
12 If it was not Northwest Natural Gas and
13 NorthernStar's intent to take this gas to
14 California, then why would they state it in
19:29:43 15 their SEC? Why is Palomar not considered in
16 the DEIS? And why is the pipeline being
17 constructed through Cowlitz County?
18 Thank you.
19 MR. FRIEDMAN: Thank you for your
19:30:01 20 comments.
21 We have Daniel Serres, and then Warren.
Page 31

Public Meetings

1

K-32

PM1 RN-110507-FERC.txt

22 MR. DANIEL SERRES: My name is Dan Serres,
23 S-E-R-R-E-S, spelling of the last name. I was
24 born in Oregon City, and I didn't think I would
19:30:33 25 be that relevant, a Clackamas County residence,
□ 38

19:30:36 1 until I found out about the Palomar pipeline,
2 but Marjorie already addressed that so I'll
3 take on something else.

PM1-25

4 I want to focus on two things. One is the
19:30:45 5 process by which this DEIS has come to us,
6 which has been disjointed, uninformative, and
7 just unhelpful to the public in terms of
8 understanding the impacts of this project. I
9 would point out the purpose of this project is
19:31:02 10 stated, as you said, to import LNG to provide a
11 new supply of gas to the Pacific Northwest.

12 The Environmental Impact Statement doesn't
13 take a comprehensive view of how to provide
14 either a new supply of gas to the Pacific
19:31:15 15 Northwest or a reliable source of energy,
16 period, to the Pacific Northwest. And again I
17 would refer back to Gloria MacKenzie who gave
18 really excellent testimony on the importance of
19 wind energy in this area.

PM1-26

19:31:30 20 The second key thing I would point out is
21 that there's key omissions in the DEIS. The
22 public is asked to comment on a project it
23 doesn't fully understand. This has been a
24 situation ever since the beginning. You can't
19:31:43 25 hear -- many of the questions you heard, you
□ 39

PM1-25 The EIS is not intended to provide a comprehensive view of how to provide a new supply of natural gas or a reliable source of energy to the Pacific Northwest. For a discussion of the purpose of the EIS, see section 1.2.

PM1-26 We do not think there are any key omissions in the EIS. We believe this document is adequate to comply with the NEPA. The final EIS addresses comments on the draft EIS in Appendix K. Maps of the pipeline route are provided in Appendix B.

Public Meetings

1

K-33

PM1 RN-110507-FERC.txt

PM1-26 19:31:45 1 were there, at the scoping session remain
cont'd 2 unanswered. Simple questions: Where is the
3 pipeline going? Am I on the pipeline? There
4 are people in the room that they might be, but
19:31:56 5 they're not really sure.

PM1-27 6 It doesn't make any sense to be in this
7 stage of the process and not have a clear
8 understanding of the process. Three tanks or
9 two? There are outstanding permits in the
19:32:07 10 process that say three tanks and two. I will
11 submit detailed written comments on that issue.

PM1-28 12 Other things, the public's being asked to
13 evaluate what the environmental impact is going
14 to be of this project. We can't see the water
19:32:22 15 assessment, presumably a couple hundred pages.
16 We've seen a summary of that report, a water
17 suitability report. We can't see the emergency
18 response plan. Everybody here, regardless of
19 whether they're wearing a blue pin or red one,
19:32:37 20 is probably going to be a participant of any
21 emergency response plan that is formally part
22 of this project.
23 It makes no sense, as Carol Carver said
24 first of all to wait until the permit is issued
19:32:46 25 and, secondly, to keep the public in the dark.
□

19:32:49 1 Quite literally in the dark.

PM1-29 2 We can't see the ballast water on the
3 (inaudible). I mean, I don't see why this is
4 critical energy obstruction information. I

Page 33

40

PM1-27 The original JPA submitted to the COE included three LNG storage tanks in the proposed action; however, that permit application was subsequently revised to include only two tanks. All current permit applications that we are aware of list two LNG storage tanks in the project description.

PM1-28 The WSA was evaluated by the Coast Guard as part of their process of preparing the WSR. That process does not include a public review and comment component; however, the WSR was provided in the draft EIS for review and comment. See also our response to comment PM1-13 and PM1-1 on the ERP.

PM1-29 The screen system for the ballast water intake was originally classified as "CEII" but was subsequently reclassified as "confidential." Engineering views of the pump station have been submitted to the FERC and other appropriate agencies for review; however, these design drawings are considered proprietary information and are not available to the public.

Public Meetings

1

K-34

PM1-29 19:33:01 5 think it's -- it's an example of how the public
cont'd 6 can't tell from that public state fisheries and
7 local economy are being accurately vetted in
8 this DEIS.
9 Finally, it says that FERC should not
PM1-30 19:33:14 10 infer mitigation in any of those three areas --
11 health, safety, and fisheries. And health and
12 safety are key issues on the pipeline because
13 this pipeline is in extremely geotechnically
14 complicated areas, like the first two miles of
19:33:27 15 the pipeline, which go right through a cliff
16 that has slid off multiple times the past few
17 years. The railroad below was closed last
18 winter because of the slide in the same general
19 area where they were going to drill right
19:33:42 20 through in the first two miles.
21 The description in the EIS as to why that
22 route was chosen rather than going through the
23 railroad --
24 (Reporter requests clarification.)
19:33:58 25 MR. DANIEL SERRES: Sure. This will all
□ 41
19:33:59 1 be in writing. Don't worry about it.
PM1-31 2 Finally, I'll point out the ballast water.
3 You have to measure the impacts to fisheries as
4 if there was ballast water screening. At this
19:34:09 5 point the public -- first of all, it doesn't
6 want to see the screening. Secondly, as far as
7 deferring implementation of any ballast water
8 screening to a third party, you're saying,
9 well, we're going to ask NorthernStar to ensure

Page 34

PM1-30 As described in section 4.1.4.3, within the first 2 miles of the sendout pipeline (between MPs 0.1 and 1.3), the pipeline is proposed to be installed using the HDD construction method specifically to mitigate impacts associated with potentially unstable slopes. The HDD borehole would be designed based on additional geotechnical studies that would be completed prior to pipeline construction to ensure pipeline integrity.

PM1-31 As described in section 4.5.2.1, NorthernStar would offer incentive-based contractual agreements for vessels to accommodate the screened water supply system at the wharf. The screened water intake design was modified based on comments from the NMFS and the revised screen designs have been approved by the NMFS. Post installation flow mapping would be conducted to assess performance of the system prior to operation.

As discussed further in section 4.5.2.1, NorthernStar has indicated it may not be feasible to require that all LNG carriers be retrofitted to utilize the screened water supply system. Sections 4.3.2.3 and 4.5.2.1 of the EIS have been revised to include a discussion of impacts on water quality and aquatic resources that could occur if LNG carriers do not use NorthernStar's proposed filtered water supply system. We conclude that impacts on sensitive aquatic resources would not be adequately mitigated without a screening mechanism. Therefore, we are recommending that NorthernStar develop a plan to deliver screened water to LNG carriers at the terminal. In addition, we are recommending that NorthernStar develop performance standards for water quality impacts associated with LNG carrier discharges of cooling water at the wharf. We will conduct additional detailed analyses of the screened water supply system and the performance standards in our revised BA and EFH Assessment. The FWS and NMFS will prepare their BOs, determining whether or not the federal actions associated with this project would likely jeopardize the continued existence of a listed species, or result in the destruction or adverse modification of designated critical habitat. The FERC would not allow construction to proceed until after we have concluded formal consultation with the NMFS and FWS.

Public Meetings

1

K-35

PM1-31 | 19:34:24 10 PM1 RN-110507-FERC.txt
cont'd | 11 and come up with a plan that any ship will have
12 ballast water screening.
13 I see nothing in the DEIS to enforce that,
14 whether it be NOAA or FERC. Unless you exhibit
mitigation you areally aren't assured it will
19:34:36 15 succeed. Okay? Yeah, I'll wrap up. Then
16 mitigation -- or your mitigation plan falls
17 apart. You have to give a reasonable assurance
18 of success for mitigation for the fish.
19 And finally, I want to say that along the
19:34:51 20 pipeline, very similar issues, along with
21 response to the various issues where, again,
22 these issues have problems. We're going to
23 mitigate this way or we're going to mitigate
24 that way. If they're kept from the public and
19:35:02 25 deferred to some agency at a later process
□ 42

19:35:05 1 that's not public, then this DEIS is deficient
2 and (inaudible) environment and into the local
3 economy. Thank you.
4 MR. FRIEDMAN: Thank you for your
19:35:18 5 commence. Almost all are these good going to
6 be addressed in the FEIS because they're
7 complex.
8 There are two things I can address. First
9 of all, pipeline route is disclosed in the
19:35:29 10 DEIS. You can actually go to the back of the
11 DEIS and see the route on USGS quadrant maps.
12 Also, NorthernStar's application is only for
13 two storage tanks. If the FERC authorizes this
14 facility, it would only be for two tanks.

Public Meetings

1

K-36

19:35:48 15 PM1 RN-110507-FERC.txt
Next speaker, please.

16 MR. WARREN MAKKELA: Good evening. My
17 name is Warren Makkela. M-A-K-K-E-L-A,
18 (inaudible.) I represent the Association of
19 Lower Columbia River Flood Control. These are
19:36:10 20 drainage entities within Multnomah and Columbia
21 counties.
22 Specifically addressing the route of the
23 pipeline which will cross levees underneath --
24 directly underneath levees within our member
19:36:28 25 districts, first, they are the Wetland Drainage
□

19:36:32 1 Improvement Company, the Web District
2 Improvement Company, the Midland Drainage
3 Improvement Company, and the Beaver Drainage
4 Improvement Company, informally Drainage.

PM1-32 19:36:44 5 These districts are organized under ORS
6 Chapter 554, and our authority and mission is
7 to provide flood control and drainage, flood
8 control from floods on the Columbia River and
9 drainage from winter storms. Our member
19:37:08 10 districts are concerned about boring --
11 directly boring beneath levees. We are
12 obligated and -- they're addressed here -- are
13 obligated to comply with the contracts with the
14 United States because of -- in compliance with
19:37:32 15 the 1950 and 1938 Federal Flood Control Act.
16 The districts have received benefits from
17 the United States. In return, we are
18 obligated, the member districts are obligated,
19 to abide by the published United States Corps

PM1-32 The comments of the Association of Lower Columbia River Flood Control regarding denying access to installing the proposed pipeline by boring beneath its levee easements are acknowledged. We understand that NorthernStar is working with the local flood control districts and the COE to address this issue. NorthernStar would be required to adhere to conditions imposed by the local levee districts' construction easements and its COE permit regarding the crossings of levees.

Public Meetings

1

K-37

PM1-32 19:37:52 20 PM1 RN-110507-FERC.txt
cont'd 21 of Engineers Levee Improvement Standards. This
22 does not allow direct boring beneath levees.
23 Therefore, we're in a position to have to deny
24 access to our -- boring beneath our levee
easements.

PM1-33 19:38:14 25 In addition, there are the other questions 44
□
19:38:18 1 outside of federal -- United States Army Corps
2 of Engineers jurisdictions are drainage ditches
3 (inaudible). They exist and are maintained on
4 a recyclable basis of five to seven years, and
19:38:35 5 we are concerned that the pipeline be well
6 protected, armored or deep enough, that there
7 is no way that we can damage the pipeline in
8 the event of an accident -- or in the event of
9 contacting the pipeline through our digging
19:38:52 10 operations. Therefore, we ask that the
11 pipeline be protected in some manner or other,
12 have them develop these -- or beneath the
13 drainage ditches.
14 Thank you. I will give you a copy here
19:39:05 15 and make it a part of the record with the
16 Corps' standards and procedures.
17 MR. FRIEDMAN: Thank you. Whenever I get
18 something from the audience like this, that's
19 in written form, I will put it in the record.
19:39:34 20 MS. PATRICIA TERHAAR: Walt Multanen. And
21 then Casey Kegg.
22 MR. WALT MULTANEN: Walt Multanen.
23 M-U-L-T-A-N-E-N. I'm a property owner,
24 possibly enjoined within a few feet of the

PM1-33 NorthernStar would cross small perennial and intermediate waterbodies in accordance with the FERC staff's Procedures and the proposed alternative measures described in section 4.4.1.3 as well as applicable permits. In addition, NorthernStar would participate in all One-Call systems and would locate and flag all underground utilities (i.e., cables, conduits, and pipelines) during surveying and staking activities to prevent accidental damage to these utilities during construction.

Public Meetings

1

PM1 RN-110507-FERC.txt
19:40:07 25 proposed pipeline. 45
□

19:40:08 1 Any and all comments that I was going to
2 make have already been made. A lot of thoughts
3 that I never entertained have been brought to
4 the surface, and so all I can do is second the
19:40:22 5 motion that the Bradwood Landing permit be
6 denied. Thank you.
7 MR. FRIEDMAN: Thank you for your
8 comments.
9 Casey Kegg is next. And after that, Randy
19:40:43 10 Martin.
11 MR. CASEY KEGG: Good evening. My name is
12 Casey Kegg, K-E-G-G. I'm a single father of
13 two kids. I currently live in Astoria, and I
14 rent a room in Westport. Right now I'm wiring
19:41:05 15 number seven paper mill. I'm here tonight on
16 behalf of the IBEW Local 48, a union
17 organization currently with 3500 members. Some
18 of them are here tonight out in the audience.
19 We strongly support the Bradwood project.
19:41:20 20 We think it's a clean and a safe project;
21 believe in the local jobs, union work; good for
22 the schools and the economy, both local and
23 state. On behalf of myself and the IBEW Local
24 48, we'd like to thank you for listening to our
19:41:37 25 viewpoints. 46
□

19:41:40 1 MR. FRIEDMAN: Thank you.
2 MR. RANDY MARTIN: Randy Martin. That's
3 R-A-N-D-Y, M-A-R-T-I-N. I'm an electrician
Page 38

PM1-34 Comment noted.

Public Meetings

1

PM1 RN-110507-FERC.txt

4 chairman of the IBEW Local 48 coast unit and
19:42:10 5 one of the delegates to the Clatsop/Tillamook
6 AFL/CIO Central Labor Council. Subjective
7 statements are less useful to the FERC staff,
8 so I'll just try to stick to the facts.

9 I was there when our Astoria mayoral
19:42:30 10 council and the IBEW coast unit gave its
11 endorsement of the Bradwood Landing project.
12 NorthernStar's slogan of good jobs and clean
13 energy just about says it all, so I don't have
14 a lot to add. I just want to second their
19:42:48 15 slogan a bit.

PM1-35

16 Good jobs. My family came to Westport,
17 Oregon, almost 20 years ago after chasing a
18 good job through five states in two years, on
19 the road in a travel trailer. That job was
19:43:04 20 provided in part by natural gas used to power
21 the paper machines and the boilers at the now
22 Georgia-Pacific-owned Wauna mill.

23 During my 20 years here, I've helped
24 install Northwest Natural Gas's turbine
19:43:21 25 compressors up at Mist, the pipelines there.

19:43:24 1 They used those compressors and pipelines to
2 inject and extract natural gas from their Mist
3 storage field. I might add, with a spotless
4 safety record.

19:43:40 5 I want to continue the partnership with
6 good supplies of natural gas, with good
7 suppliers of natural gas. These jobs were in
8 part provided by natural gas. I want to avoid

Page 39

47

PM1-35 Comment noted.

K-39

Public Meetings

1

K-40

PM1 RN-110507-FERC.txt

PM1-35 9 the economic hardship that my family had to go
cont'd 19:44:04 10 through searching for a good job throughout the
11 American West.

PM1-36 12 The other slogan, clean energy. We need a
13 good, clean supply of energy, and a lot of
14 people using that term here, but there's just
19:44:23 15 two products right there that I know perhaps
16 put to use. Would you rather see a new nuke
17 down there or oil refinery? Maybe a coal-fired
18 generator? Perhaps now that another promising
19 industrial site has been identified along the
19:44:42 20 Columbia River, who knows what could come next.

PM1-37 21 A bird in the hand, especially an
22 environmentally benign bird, may be the best
23 way to go. NorthernStar has promised to do
24 their best to mitigate environmental damages
19:45:01 25 and replace that habitat disturbed for whole. 48
□

19:45:07 1 Let's not be those not-in-my-backyard-type
2 people who would deny future generations clean
3 energy and new jobs.

4 MR. FRIEDMAN: Thank you. I believe that
19:45:21 5 Mr. Martin was the last speaker on the list.
6 Is there anyone who has not yet spoken who
7 wishes to speak? If so, please raise your
8 hand.

9 All right. At this time if anyone spoke
19:45:34 10 earlier who did not -- who feels they have more
11 to say, wants another three minutes, I'll allow
12 it.

13 MS. GLORIA MacKENZIE: I don't need three
Page 40

PM1-36 Comment noted.

PM1-37 Comment noted.

Public Meetings

1

PM1 RN-110507-FERC.txt

14 minutes.

19:45:47 15 MR. FRIEDMAN: I do need you to go to the
16 microphone. Again, any time anyone speaks,
17 they need to state their name and spell it for
18 the court reporter.

19 MS. GLORIA MacKENZIE: My name is Gloria
19:45:59 20 MacKenzie. M-A-C-K-E-N-Z-I-E.

PM1-38 21 I don't have the specifics with me, but I
22 believe it is the Corps of Engineers' permit
23 application, dated I believe October 18th,
24 where it states that the pipeline route is
19:46:20 25 Germany Creek, and that is a definite

49

19:46:24 1 difference between the DEIS. And I did call,
2 and they did say at the Corps of Engineers that
3 they believe it might be Germany Creek and not
4 Abernathy Creek. So -- and I'm sorry, I don't
19:46:41 5 have the paperwork. I just wanted to clear up
6 that one point that you seem to be not sure of,
7 Mr. Friedman. Thank you.

8 MR. FRIEDMAN: Like I said earlier, the
9 pipeline is in the DEIS. You can look at it.

19:46:58 10 MS. GLORIA MacKENZIE: Okay. But you look
11 at the Corps of Engineers' paperwork, their
12 application, because it is definitely
13 different.

14 MR. FRIEDMAN: That's something we'll look
19:47:06 15 at before we recommend the DEIS.

16 MS. GLORIA MacKENZIE: Thank you.

17 MR. FRIEDMAN: Thank you.

18 Are there any more speakers from the
Page 41

PM1-38 The pipeline route is shown in Appendix B. The pipeline would cross the Columbia River west of Germany Creek.

K-41

Public Meetings

1

K-42

PM1 RN-110507-FERC.txt

19 floor? Please come on up and get your three
19:47:16 20 minutes. Just make sure you restate your name
21 for the record and spell it.

PM1-39

22 MR. BILL CASTLE: Thank you. My name is
23 Bill Castle, C-A-S-T-L-E. I'm on the pipeline
24 route, and I would challenge FERC as to where
19:47:29 25 the pipeline is. You cannot tell me within a

50

19:47:32 1 hundred feet where it's going to be going under
2 the Columbia River, from the Washington side.
3 We have seen three different satellite images
4 showing different spots in which this is going
19:47:44 5 to be.

6 We've been told in the very beginning that
7 our five acres was going to be the drill site.
8 As of last -- two weeks ago, down in Astoria,
9 Mr. Garrett did come up to me and tell me that
19:47:58 10 it is not on our property, but he would also
11 not tell me exactly where it is. If I'm not
12 mistaken, the draft environmental statement
13 says they can move that pipeline 30 days prior
14 to construction.

19:48:09 15 We've seen a report that also states that
16 up to three possibilities that a geological
17 outfit in Portland did that right back up on
18 our property, is the most economical, yet we're
19 not privy to that information.

PM1-40

19:48:25 20 This also is a concern whether it's on the
21 ridge between Mill Creek and Abernathy, it is
22 not at Germany Creek, that there's
23 approximately 20 wells that are going to be

Page 42

PM1-39 The pipeline route is shown in Appendix B.

PM1-40 As described in section 4.3.1.4, NorthernStar has prepared a preliminary well protection plan that addresses monitoring and mitigation for potential impacts on wells during pipeline construction, including HDD activities. The plan was filed with the FERC on February 19, 2008 is available for viewing on the FERC's internet web page at www.ferc.gov, through the eLibrary link. The plan states that NorthernStar would investigate the regional hydrology and local boring logs, gather information from well owners, locate the wells in the field and on maps, and evaluate geology, water levels, and depths drilled using cross sections of the HDD profile. Such an evaluation would identify any wells that are completed in a regionally shallow aquifer and assess the relative risk of impact and potential need for mitigation.

Public Meetings

1

K-43

PM1 RN-110507-FERC.txt

PM1-40 24 affected by this. According to this draft
cont'd 19:48:44 25 environmental statement, what's defined as a 51
□

19:48:46 1 shallow well? we drilled 140 feet, got six
2 gallon a minute. We drill to 522 feet to get
3 14 gallons a minute. Is that defined as a
4 shallow well?

19:48:59 5 If they disturb the water, if they drill
6 within 120 feet of our well, I would bet that's
7 going to disturb that shale aquifer, that the
8 water runs through in that aquifer, especially
9 if they use their bentonite process.

PM1-41 19:49:17 10 The other thing that we have written, my
11 wife and I have written to the FERC is about
12 the hillside they're going to drill on. Even
13 if it is not on our property, I cannot get a
14 straight answer from even Mr. Garrett; get only
19:49:26 15 told that I'm using the best engineers that
16 money can buy; that I challenge you cannot fool
17 Mother Nature on this issue when we live in an
18 area in which the hillsides fall off the top by
19 themselves.

19:49:41 20 It's estimated that it will take between
21 five and 11 million pounds of pressure to pull
22 this pipeline under the river. This hillside
23 where this is going to be at is steeper than
24 one to one. Now, not even you guys back here
19:49:53 25 that live here, do you suppose that hillside 52
□

19:49:57 1 might fall off?

PM1-41 The HDD boreholes would be conducted by professional drilling contractors based on information obtained from geotechnical studies. The HDD would avoid, wherever possible, unstable areas that could generate a landslide.

Public Meetings

1

K-44

2 PM1 RN-110507-FERC.txt
I don't get any straight answers, and
3 FERC's had this information since the first
4 filing or permitting that was mailed back in --
19:50:04 5 almost two and a half years ago -- excuse me --
6 15 months, thereabouts. Nobody's answered
7 these questions yet, and I think they need to
8 be addressed.

9 MR. FRIEDMAN: Thank you for your
19:50:16 10 comments.

11 Mr. MacKenzie? Does anyone else want to
12 speak? Again, please restate your name and
13 spell it for the court reporter.

14 MR. DUNCAN MacKENZIE: My name is Duncan
19:50:26 15 MacKenzie. D-U-N-C-A-N, M-A-C-K-E-N-Z-I-E.

PM1-42 16 Reference was made to the operational
17 noise aspects of the LNG terminals found in the
18 DEIS on page 4-392 and table 4.10.2-4. There
19 appear to be a number of missing equipment

19:50:44 20 elements in this table, most notably the noise
21 contributions arising from where nitrogen and
22 unknown quantity of vapor return blowers and
23 most blaringly the five 2,335-horsepower

PM1-43 24 sendout pumps. The overall decibel levels
19:51:00 25 figures cited are uncharacterized as to whether

53

19:51:02 1 the value is from a single unit or multiple
2 units, and whether or not the figure includes
3 the motor associated device or is the device
4 alone.

PM1-44 19:51:11 5 Furthermore, the number of units of
6 specific type is undocumented. It is the -- it

PM1-42 Nitrogen injection equipment is not currently planned for the project. If it is added at a later time, an additional acoustical evaluation for this added equipment would be completed. As indicated by Table 4.10.2-4, the sendout pumps are referred to as the LNG Booster Pumps.

PM1-43 The noise values listed are from a single unit at the listed reference distance. The noise measurement at a distance of 1 meter would incorporate the noise associated with the motor and any other ancillary equipment.

PM1-44 The overall sound power level is from the combined equipment package. The modeling that was completed for the project included the simultaneous operation of all pieces of equipment, although in practice all equipment may not be operating at the same time.

Public Meetings

1

K-45

PM1-44 7 is noted that the noise level of the submerged
cont'd 8 combustion vaporizer is 118 decibels on an
9 unweighted scale. Is this a generalized
10 composite value comprised a generous source of
11 suppressed fund of vaporizers, such as
12 combustion air blowers, blower motors, blower
13 intake and exhaust fans? Is this one unit or
14 the worst case of seven units operating
15 simultaneously?

PM1-45 16 If the plant is expanded to the three
17 proposed additional SDPs, how much will this
18 increase the noise level? 118 dB noise level
19 of the vaporizer appears to be an overall
20 measurement only without characterization shown
21 for which frequencies the various levels might
22 occur. If there is a significant low-frequency
23 component to this sound, will it affect the
24 overall reception of the noise?

19:52:00 25 Finally, as found in the applicant's

54

PM1-46 19:52:02 1 Resource Report 9, submission section 4.9,
2 sound propagation factors on page 9(b)-11,
3 hills surrounding the facility were modeled
4 from GIS contours at 20-meter height intervals
19:52:15 5 to simulate shielding from the terrain at
6 noise-sensitive areas to the west of the
7 facility. This modeling assumption needs more
8 as the noise-sensitive area designated as M2
9 inhabited areas to the east of the site on
19:52:28 10 Puget Island. The hills, rather than shielding
11 of the shoreline area in Puget Island, serve as

Page 45

PM1-45 If the plant is expanded and additional equipment is added, the noise associated with the additional equipment would be logarithmically added to the background noise. In general, doubling the sound power level by adding additional equipment adds 3 dB to the overall noise. In practice, the addition of equipment typically would not double the overall sound power level which would result in a noise increase that would be less than 3 dB. The threshold for perception for noise change is 3 dB. The SCVs would be enclosed which would reduce both high and low frequency noise for an overall estimated noise reduction of 10 dB.

PM1-46 As provided in Resource Report 9, the water between the site and noise receptor N2 was modeled as a perfect sound reflector to provide no attenuation. The rock cliff to the south, around the corner from the proposed LNG facility should not provide any reflective sound from the facility due to the facility location being shielded from the rock cliff. In addition, the sloping hills behind the proposed LNG terminal are not vertical rock cliffs, are foliated and would tend to absorb noise, potentially reflect noise upward and not reflect the noise laterally east across the open water.

Public Meetings

1

K-46

PM1-46 cont'd 12 PM1 RN-110507-FERC.txt
13 a reflective surface instead, especially the
rock face at the southern end of the site.

PM1-47 14 The overall presentation of the operation
15 of noise aspects associated with proposed LNG
16 terminals is, at best, cursory and does not
17 include significant equipment elements. It's
18 requested that FERC recommend the applicant
19 provide a far more complete and realistic
19:52:55 20 assessment of the noise arising from the
21 operations of the site.
22 MR. FRIEDMAN: Thank you.
23 Anyone else want to have an opportunity?
24 Please state and spell your name for the court
19:53:07 25 reporter.

PM1-48 19:53:08 1 MR. STEVE DRAGICH: D-R-A-G-I-C-H. I'll
2 speak specifically to the Corps of Engineers
3 401 and 404 permit application, issued on
4 October 18th, 2007, specifically the river mile
19:53:24 5 that they designated for the crossing at the
6 Columbia River.
7 Under the National Oceanographic and
8 Atmospheric Administration that prints most of
9 the navigational charts in the United States,
19:53:37 10 they designate river miles. At the crossing
11 location, they designated in the Corps permit
12 river mile 54. This does not exist on any know
13 charts. They're in five-mile intervals, and
14 the nearest river mile is 55, which is
19:53:56 15 approximately between the Abernathy point and
16 the Bunker Hill point on the Washington state

55

PM1-47 The listed noise equipment reflects the predominant noise producing equipment sources, as documented at existing LNG facilities. In section 4.10.2.2, we recommend that NorthernStar make all reasonable efforts to ensure its predicted noise levels from the LNG terminal are not exceeded at the NSAs and file noise surveys with the Secretary no later than 60 days after placing the LNG terminal in service. However, if the noise attributable to the operation of the LNG terminal exceeds 55 dBA L_{dn} at an NSA, NorthernStar should file a report on what changes are needed and install additional noise controls to meet the level within 1 year of the in-service dates. NorthernStar should confirm compliance with these requirements by filing a second noise survey with the Secretary no later than 60 days after it installs the additional noise controls.

PM1-48 The 5-mile river mile intervals labeled on the referenced maps do not indicate that the intervening river mile locations do not exist. A location designation of river mile 54 is appropriate to show the specific crossing location of the proposed pipeline route.

PM1-48 17 PM1 RN-110507-FERC.txt
 side of the river. This is just another
 cont'd 18 example of the vagueness in the permit
 19 application when one federal agency is unsure
 19:54:15 20 of where the exact crossing location is.

PM1-49 21 Now, you mention the USGS quadrant maps.
 22 These are basically contour maps. In this area
 23 of river crossing there are four quadrants:
 24 The Clatskanie, the Stella, and the Riderwood
 19:54:34 25 (phonetic). At a photo scale reciprocal which
 □

19:54:38 1 the maps were derived from, which are aerial
 2 photos, the first flight mentioned in this area
 3 was taken in 1923. During the second -- before
 4 the Second World War they were -- a reflight
 19:54:52 5 was taken, which your maps in the back of your
 6 DEIS are based on, were taken in 1940.
 7 And I have copies from FERC on the
 8 supposed -- one of the proposed pipeline routes
 9 that are so illegible that you can't even see
 19:55:12 10 the contours from the USGS maps. This Corps
 11 permit for the clean water and wetlands permit
 12 is just another example of how vague the permit
 13 process has gone in this proposal.

14 MR. FRIEDMAN: Thank you for your
 19:55:32 15 comments.
 16 Is there anyone else who wishes to speak?
 17 MR. DANIEL SERRES: Dan Serres again.

PM1-50 18 S-E-R-R-E-S. I just have a couple of points.
 19 First I want to make clear the question is both
 19:55:48 20 where the pipeline's going, because the maps,
 21 as Mr. Dragich pointed out, are not incredibly

Public Meetings

1

PM1-49 The pipeline route is clearly legible on the maps in Appendix B. These are copies of standard 7.5-minute (1:24,000) scale topographic quadrangle maps produced by the USGS at different times. For example the Cathlamet, Washington quadrangle map, including the location of the proposed Bradwood Landing LNG terminal, was dated as surveyed by the USGS in 1985.

PM1-50 The maps of the pipeline route provided in Appendix B are at a standard (1:24,000) resolution that we believe is adequate to indicate the proposed route, but are not sufficient for detailed design purposes. The filed aerial alignment sheets (at a scale of 1:6,000) identify the detailed proposed route. The socioeconomic impacts and benefits of this proposed project are discussed in section 4.8 of our EIS.

Public Meetings

1

K-48

PM1-50

cont'd

22 PM1 RN-110507-FERC.txt
high resolution. Actually, the best maps I
23 have seen are in the bio assessment for this
24 facility.

19:56:01 25 The question is not so much that actually
□ 57

19:56:04 1 as it is who's on the pipeline? And that's --
2 that's pretty important for evaluating
3 socioeconomic impact of this project. I think,
4 in general, socioeconomic impacts on this
19:56:15 5 project is entirely weighted on one side. We
6 have the benefits, you know, with huge
7 assumptions made about natural gas or LNG
8 coming into the area.

9 Secondly, I wanted to point out -- let me
19:56:31 10 see. I lost my spot. Sorry. That's it.
11 Thank you.

12 MR. FRIEDMAN: Thank you for your
13 comments.

14 Is there anyone else who wishes to speak?

19:56:48 15 All right.

16 MS. MARJORIE CASTLE: Marjorie Castle,
17 C-A-S-T-L-E, landowner.

PM1-51

18 In the draft EIS it states, as
19 NorthernStar has stated, that there would be
19:57:01 20 125 deliveries per year, meaning 125 vessels in
21 the river. NorthernStar anticipated 125
22 deliveries for a total of 25 million cubic
23 meters of LNG per year. However, according to
24 the Sandia study and the waterways suitability
19:57:22 25 assessment, the Coast Guard is restricting
□ 58

PM1-51 The maximum number of annual LNG carrier trips associated with the Bradwood Landing Project would be 125 regardless of the LNG carrier capacity.

Public Meetings

1

K-49

PM1-51 19:57:26 1 NorthernStar to the smaller vessels no greater
cont'd 2 than 148,000 cubic meters, until additional
3 analysis addressing vessels with higher cargo
4 capabilities is completed.
19:57:38 5 NorthernStar, though, has continued to use
6 the figures of 125 deliveries per year, or a
7 total of 18,500 -- or 18,500,000 cubic meters
8 of gas using the smaller 140 -- up to
9 140,000-cubic-meter vessels. That means that
19:57:58 10 they would be accepting a loss of 6.5 million
11 cubic meters of gas per year.
12 One of two things is happening here.
13 NorthernStar either does not have customers to
14 warrant the need for the additional deliveries
19:58:12 15 to pick up the loss in revenue, or NorthernStar
16 is being less than truthful to us about how
17 many deliveries will actually occur using the
18 smaller ships and that they actually anticipate
19 as many as 169 vessels per year in the river.
19:58:30 20 This would mean an LNG ship would be coming up
21 the river, one per day, according to their
22 figures; at the pier, 24-hour unloading period;
23 or going down the river another day, for over
24 500 days in a 365-day year.
19:58:48 25 Questions that I think that should be
□ 59
19:58:50 1 addressed in the final EIS:
2 How many ships will indeed be in the river
3 during the course of a year?
PM1-52 4 And what impact will that have on the
19:58:59 5 shipping of all ports along the Columbia and
Page 49

PM1-52 Our discussion of potential impacts of LNG carriers in the waterway to the LNG terminal on other commercial and recreational ship traffic on the lower Columbia River is included in section 4.8.1.7. We believe this project would not result in significant impacts on upriver ports.

Public Meetings

1

K-50

PM1 RN-110507-FERC.txt

PM1-53 6 the Snake river system, socioeconomics?
7 what will the cumulative environmental and
8 endangered species impact be if NorthernStar
9 does increase the amount of shipments per year?

PM1-54 19:59:14 10 If the research is completed to the
11 satisfaction of the Coast Guard and the larger
12 mega vessels are allowed into the river, what
13 will be the impact on all identified
14 environmental issues as well as the socioeconomic
19:59:25 15 impact on all other stakeholders along the
16 Columbia and Snake river systems?

PM1-55 17 What is the plan of action to be taken if
18 the 1200-foot mega tankers are allowed and
19 erosion of beachfront occurs, leading to
19:59:39 20 lawsuits?

PM1-56 21 Who will monitor the truthfulness of the
22 information in the NorthernStar's land use
23 application and be accountable to the people
24 and environment for actions they perform in
19:59:50 25 opposition to what was understood, since
□ 60

19:59:51 1 several justifications for adoption of
2 applications and the permitting process are
3 based on, "it is our understanding"?
4 Thank you.

20:00:04 5 MR. FRIEDMAN: Thank you.
6 Is there anyone else? Okay.
7 MR. VANCE FRASER: Vance Fraser again.
8 F-R-A-S-E-R.

PM1-57 9 The DEIS should include a sensitivity
20:00:18 10 analysis on the impacts that would occur when
Page 50

- PM1-53 NorthernStar has no current plans to increase the capacity of its project. As discussed in section 2.9, before any expansion of the proposed facilities, NorthernStar would be required to seek the appropriate authorization from the FERC. The FERC would conduct a separate environmental analysis under NEPA before authorizing a proposed expansion of NorthernStar's facilities.
- PM1-54 Should NorthernStar wish to receive larger LNG vessels in the future, in addition to determining that safety and security measures are adequate to accommodate the larger LNG vessels, supplemental review under NEPA and other applicable laws and regulations would be required by the Coast Guard. Furthermore, the number of ships calling at the LNG terminal is tied to the offload capabilities at the terminal. Any future increase in ships would necessitate additional storage capacity. As discussed in section 2.9, before any future increase in storage capacity, NorthernStar would be required to seek appropriate authorization from the FERC. The FERC would conduct a separate environmental analysis under the NEPA before authorizing a proposed expansion of NorthernStar's facilities.
- PM1-55 Shoreline erosion is discussed in section 4.1.2.3.
- PM1-56 The FERC staff, our third-party environmental consultants, cooperating agencies, and other federal, state, and local reviewing agencies are responsible for fact checking and verifying the claims made by the applicants. Clatsop County independently reviewed NorthernStar's land use applications and the County Board of Commissioners accepted the proposed land use changes in a final ruling on March 20, 2008.
- PM1-57 We address the potential impacts associated with multiple LNG terminals located in close geographic proximity in the cumulative impacts section (4.12) of this EIS. However, the FERC will review each proposed LNG terminal individually. We discuss the number of jobs this project would generate in section 4.8 (socioeconomics).

Public Meetings

1

K-51

PM1 RN-110507-FERC.txt

PM1-57 11 multiple LNG facilities are allowed on the
cont'd 12 Columbia River by equal protection law, and far
13 more jobs will be lost than gained at the ports
14 when that occurs.

PM1-58 20:00:38 15 Secondly, Oregon is simply being used, and
16 I do mean "used," as a backboard to California,
17 regardless of what any made-up studies the
18 promoters say. The California Lands
19 Commissioner has stated so, and Oregon Public
20:00:56 20 Utilities Commissioner has also stated that the
21 majority of the imported and regasified LNG
22 would go to California.

PM1-59 23 Why aren't these statements in the DEIS,
24 rather than just quoting the Northwest Natural
20:01:14 25 Gas Association? Why aren't the results of 61

20:01:21 1 existing pipeline capacity meetings, which
2 state "no increase needed," also included in
3 the EIS?
4 Thank you.

20:01:33 5 MR. FRIEDMAN: Thank you.
6 Has everyone had an opportunity to speak
7 who wanted to? If that's the case, at this
8 time I'd like to wrap up this meeting, close
9 up. On behalf of the Federal Energy Regulatory
20:01:47 10 Commission, I want to thank you all for coming
11 here tonight, providing your comments on the
12 DEIS for the Bradwood Landing LNG project. Let
13 the record show that this meeting concluded at
14 approximately 8:00 p.m. Thank you.
15 (MEETING ADJOURNED AT 8:00 P.M.)

Public Meeting Transcript of Proceedings
Tuesday, November 6, 2007, 9:00 a.m.
Clatskanie, Oregon

The introductory comments for this public meeting are not included in the FEIS because they are very similar to those of the Monday, November 5, 2007, 6:30 p.m. meeting in Cathlamet, Oregon, which are included. The complete transcript of the Tuesday, November 6, 2007, 6:30 p.m. meeting in Clatskanie, Washington can be obtained at the FERC's internet website (www.ferc.gov) using the eLibrary link. Click on the eLibrary link, click on "General Search," and enter the docket number excluding the last three digits in the Docket Number field (i.e., CP06-366). Be sure you have selected an appropriate date range. For assistance, please contact FERC Online Support at FERCOnlineSupport@ferc.gov or toll free at 1-866-208-3676, or for TTY, contact (202) 502-8659.

Public Meetings

2

PM2 RN-110607-FERCam.txt

09:22:20 1 in order today. People who have not had an
2 opportunity to speak will go first.

3 This is a meeting for you, the public, to
4 comment on the DEIS. It is not a question or
09:22:35 5 answer forum. To the extent that I may know
6 the answer to your question, I'll address it,
7 if possible. However, most of your comments
8 will probably be too complex for me to answer
9 off the cuff, and you'll have to wait until the

09:22:51 10 FEIS is issued to see our researched answer to
11 those questions. I will address questions of
12 an administrative or process nature.

13 Before we start hearing from speakers, I
14 suggest that we take a short break, about a
09:23:09 15 minute, given how few people are in the room.
16 So anyone who has not had an opportunity to
17 sign up at the speakers' list can do so at this
18 point. If you haven't signed up on the
19 speakers' list, Janelle has it, please do so
09:23:22 20 now, and then we'll give the floor to the
21 public.

22 (Brief recess.)
23 MR. FRIEDMAN: Is there anyone who has not
24 signed up for the speaker's list who wants to?

09:24:00 25 Please do so now, because then Janelle's going
18

09:24:02 1 to bring it up to me.
2 So the only thing that I ask is that you

Public Meetings

2

K-57

PM2 RN-110607-FERCam.txt
3 stand up where you're sitting. We don't have a
4 microphone or a podium. You speak as loudly as
09:24:38 5 you can. Speak as slowly as you can. Don't
6 worry about the three minutes. It's more
7 important that we get what you have to say
8 accurately from the court reporter. If you
9 have very detailed comments, you're better off
09:24:51 10 sending them to us electronically or through
11 the U.S. mail rather than trying to spend half
12 an hour trying to tell them to us here
13 tonight -- or here this morning.
14 I ask that each speaker stand up, state
09:25:04 15 their name clearly for the record, and spell
16 their last name, identify any organization they
17 may be representing. If you are a landowner
18 along the pipeline route, please indicate where
19 your property is located according to mile
09:25:17 20 marks. And if you need to find out where your
21 property is located, I have a copy of the DEIS
22 with me that shows mile marks.
23 So the first person on our list is Betty
24 Reeves.
09:25:32 25 MS. BETTY REEVES: I think you answered my
19
09:25:33 1 question, so...
2 MR. FRIEDMAN: Okay. Next -- and if I
3 mispronounce your name, please correct me. I'm
4 sorry. Marvin Albert.
09:25:42 5 MR. MARVIN ABBOTT: Abbott.
6 MR. FRIEDMAN: Abbott. I'm sorry.

Public Meetings

2

K-58

PM2 RN-110607-FERCam.txt
7 MR. MARVIN ABBOTT: I'm Marvin Abbott.
8 Last name is A-B-B-O-T-T. And I'm here to
9 speak in favor of the project, whether that's
09:25:51 10 of significance or not, but in favor of labor.
11 I'm a business rep for the Machinists'
12 Union. I've been a business rep for about 30
13 years. I personally am assigned to operations
14 in Washington, Oregon, California, particularly
09:26:03 15 people in this community know Stimson Lumber
16 Company. That's one that I personally
17 represent. And so I've had quite a bit of
18 involvement in this community and this area and
19 know quite a few people here.

PM2-1

09:26:15 20 And it is certainly a rural community
21 where there's no question that jobs are very,
22 very critical. These are the types of jobs
23 that support the whole -- the whole community,
24 not just a few. A lot of people here in
09:26:28 25 Clatskanie that work here are from Kelso,
20

09:26:30 1 Longview, all those other types of things.
2 So, I think jobs is an extremely important
3 issue and particularly family-wage jobs. Most
4 small communities have a couple of antique
09:26:40 5 shops, but if there isn't a Stimson and a
6 NorthStar, then there isn't much to support
7 that community. So a family wage will be a
8 major factor in this as far as I'm concerned.

PM2-2

9 With that being said, I know, from what
09:26:51 10 I've -- from what I've learned, that NorthStar

PM2-1 Comment noted.

PM2-2 Comment noted.

Public Meetings

2

K-59

PM2-2
cont'd

PM2 RN-110607-FERCam.txt
has got a good track record of environmental
stuff, and I really do believe that -- that the
overall benefit of this would be that, clearly,
it would add economic value to the properties
to -- to the families and the communities here,
and so it would be a benefit to the people in
the area.
MR. FRIEDMAN: Thank you.
Next on my list is Gary Herber.
MR. GARY HERBER: My name is Gary Herber.
That's H-E-R-B-E-R. I am a property owner
that's going to be affected by this. In
addition, they are planning on using my
property to dig underneath one of the sloughs.
The one question I have asked, and the

PM2-3

09:27:35 1 slide barely touched on it -- because every
2 time I come to one of these meetings I go away
3 with the feeling that this is a done deal and
4 that the people that are directly affected are
09:27:45 5 just being listened to out of courtesy, to be
6 honest.

PM2-4

7 The one question I have is what kind of
8 compensation are we looking at for the loss of
9 our property and, in some cases, you know, the
09:27:59 10 danger of what's going on on our property?
11 Your slide touched on that, said they should
12 act in good faith. That doesn't mean that they
13 will act in good faith.
14 Who is overseeing this? Is there some

Page 18

PM2-3

No decision has yet been made about the proposed Bradwood Landing Project. After we issue the EIS, the Commission will consider the environmental impacts of the project, together with non-environmental data compiled by staff, and make its decision in an Order which discloses whether or not the project should be authorized.

PM2-4

As discussed in section 4.8.3.3, NorthernStar would compensate the landowner for use of the land. The easement agreement between NorthernStar and the landowner would specify compensation for damage to property during construction, loss of use during construction, and loss of renewable and nonrenewable or other resources. NorthernStar would seek to negotiate a mutually acceptable agreement. However, a FERC Certificate conveys with it the right of eminent domain under section 7h of the NGA. Therefore, if negotiations fail to produce an agreement, NorthernStar could initiate condemnation proceedings, and the value of the easement and the amounts for compensatory damages would be determined by the local district court. Pipeline safety is addressed in section 4.11.9 of this EIS.

Public Meetings

2

K-60

PM2-4
cont'd

PM2 RN-110607-FERCam.txt
09:28:14 15 figure in mind? Who do I ask? I've asked at
16 every meeting I've gone to. I've never
17 received an answer. I think it's time we get
18 some kind of a clue as to how much is at stake
19 here. Thank you.

09:28:25 20 MR. FRIEDMAN: Okay. I can answer some of
21 those questions. The value of compensation is
22 negotiated between you and NorthernStar.
23 That's who determines that.

24 MR. GARY HERBER: Attorneys probably then.

09:28:38 25 MR. FRIEDMAN: All right. And if you
22

09:28:39 1 cannot reach an agreement, the local court, not
2 the FERC, but a local district court will
3 decide in an eminent domain hearing what the
4 value of your property is and what the
09:28:48 5 compensation should be. So that's made
6 locally, in the local county courts. All
7 right?

8 What was -- your other question was about
9 what, Gary?

09:29:02 10 MR. GARY HERBER: Oh, I don't know now.
11 You answered my question, though, because I was
12 told by the natural gas company that I would
13 have to hire an attorney.

14 MR. FRIEDMAN: Oh, I know what it was. It
09:29:13 15 was about whether or not it's a done deal.
16 That's an important statement. I've heard that
17 at numerous meetings. That's a total
18 misconception. It's not a done deal until two

PM2 RN-110607-FERCam.txt
 19 tings -- three things happen:
 09:29:25 20 One, the Commission makes a final
 21 decision. All right? I've already gone over
 22 this morning that they're not going to make the
 23 final decision until: One, we've done an FEIS;
 24 two, we've looked at the nonenvironmental
 09:29:35 25 issues about markets, rates, and needs; and,
 23
 09:29:37 1 three, after the decision is made, then
 2 NorthernStar has to implement all the
 3 conditions of the order. And I believe there
 4 are something like 98 conditions in the DEIS.
 09:29:48 5 Only then would we allow this project to go
 6 forward.
 7 I can also tell you something that you may
 8 or may not know, which is that the FERC has
 9 authorized numerous LNG facilities all across
 09:29:59 10 the United States, some of which have never
 11 been built even though they had authorization.
 12 For example, I was a project manager for an LNG
 13 facility in Corpus Christi, Texas. They have
 14 an order. They have a certificate. They can
 09:30:14 15 build tomorrow if they chose to. They have not
 16 built. The reason is they have no market for
 17 the gas.
 18 Under Section 3 of the Natural Gas Act,
 19 the company is at a hundred percent risk for
 09:30:28 20 all market issues relating to the importation
 21 of LNG. What that means is that these
 22 facilities cost over \$500 million. And no

Public Meetings

Public Meetings

2

K-62

PM2 RN-110607-FERCam.txt
23 company is going to go forward until they
24 believe the economics are ripe for them to do
09:30:44 25 so.
24

09:30:45 1 All right. Now our next speaker is Kyle
2 Munson.
3 MR. KYLE MUNSON: My name is Kyle Munson.
4 That's M-U-N-S-O-N. I represent Transmarine
09:30:54 5 Navigation. We're a shipping agency. We
6 represent charters and owners who are bringing
7 the ships in. Currently work petroleum tankers
8 coming up and down the Columbia and Willamette
9 rivers as well as grain ships.

PM2-5 09:31:11 10 And I just wanted to express being for
11 this project. The economic impact that I think
12 a lot of people probably don't look at is that
13 the service sector, working with these ships,
14 each ship that comes in, somebody has to
09:31:25 15 arrange pilots, tugs, people that are
16 coordinating all of that. You've got stores'
17 deliveries. You've got barging companies.

18 I think that the economic impact of a
19 project like this would far outreach just the
09:31:39 20 people working at the plant. There are a lot
21 of service jobs that are tied in with the
22 shipping industry, and it could be a real good
23 deal for Oregon's economy.

24 MR. FRIEDMAN: Thank you for your
09:31:50 25 comments.
25

PM2-5 Comment noted.

Public Meetings

2

PM2 RN-110607-FERCam.txt

09:31:53 1 Next I have Rick Stonex. And please
2 correct me if I mispronounce your name.
3 MR. RICK STONEX: Stonex, S-T-O-N-E-X.
4 MR. FRIEDMAN: I'm sorry.
09:32:03 5 MR. RICK STONEX: I represent Greenwood
6 Resources. We manage the Lower Columbia Poplar
7 Tree Farm here in the area, and I'm also
8 representing Midland Diking District. Our land
9 is impacted, for the Greenwood Resources, from
09:32:17 10 about mile six to 16 on the pipeline, I would
11 guess. Midland Diking District is within that.

K-63
PM2-6 12 As for Greenwood Resources -- I've got two
13 hats on here. For Greenwood Resources, we
14 support the project and believe that the
09:32:31 15 environmental impact is outweighed by the
16 economic benefits to the region. For both
PM2-7 17 Midland and Greenwood Resources, there's
18 concerns about levy crossings within Oregon
19 under the pipeline and the internal diking
09:32:43 20 structure.

21 And I think Warren Makkela from Beaver
22 district addressed most of that, and I just
23 want to reiterate that we stand by his comments
24 for both Midland Diking District and Greenwood
09:32:54 25 Resources and Greenwood Resources.

26

09:32:56 1 MR. FRIEDMAN: Thank you very much for
2 your comments.
3 Next is Marc Averbach.
Page 22

PM2-6 Comment noted.

PM2-7 Updated sections 4.2 and 4.3 address impacts on soils and sediments, and water resources, respectively. See also our response to comment PM1-32.

Public Meetings

2

K-64

PM2 RN-110607-FERCam.txt

4 MR. MARC AVERBACH: Thank you. My
09:33:04 5 comments were referred to Section 2.1 --
6 MR. FRIEDMAN: Mark, can you stand up,
7 please?
8 MR. MARC AVERBACH: No, not really.
9 MR. FRIEDMAN: Okay. That's fine.
09:33:11 10 MR. MARC AVERBACH: I prefer not to.
11 MR. FRIEDMAN: Marc, can you spell your
12 name for the court reporter.
13 MR. MARC AVERBACH: Yes. A-V-E-R-B, as in
14 boy, A-C-H. My comments refer to section 2.1.6
09:33:20 15 of the DEIS, the Palomar pipeline. I'm an
16 affected landowner on the pipeline.
17 MR. FRIEDMAN: On Palomar?
18 SPEAKER: On Palomar. I understand it's
19 only tangentially referenced in the DEIS.
09:33:33 20 To quote from the DEIS, it says: However,
21 as of the date of the writing of the draft EIS,
22 Palomar has not yet submitted its formal
23 request to initiate prefiling process with the
24 FERC.
09:33:43 25 As you know, they are now in a

27

09:33:45 1 notice-of-intent period.
2 The Palomar pipeline -- it also says the
3 Palomar pipeline would then proceed northwest
4 to interconnect with the Northwest Natural's
09:33:53 5 existing source shield at Mist. From Mist, the
6 Palomar pipeline could branch off to serve the
7 proposed Bradwood Landing LNG import terminal.
Page 23

PM2-8 The final EIS has been updated in section 3.1.2.2 to indicate that on August 30, 2007, the FERC accepted a request from Palomar, to initiate the Pre-filing environmental review process for its proposed new pipeline project in Oregon, in Docket No. PF07-13-000.

PM2-9 See our response to comments PM1-24 and CO4-1 regarding the purpose and route of the Palomar pipeline.

Public Meetings

2

K-65

PM2-9
cont'd

PM2-10

PM2-11

PM2 RN-110607-FERCam.txt

8 On a map I have in my possession labeled

9 in part Northwest Natural/TransCanada Palomar

09:34:07 10 gas transmission project dated 5/21/07. The

11 pipeline route is more accurately described as

12 making a beeline for Bradwood with a spur to

13 Mist. Indeed, a Palomar representative told me

14 in mid-October the following: That the Mist

09:34:22 15 spur was off the table; that the Clatsop County

16 portion of the pipeline would only be built if

17 Bradwood was built, but the intent of the

18 pipeline was to get gas to California.

19 There's several sections about the

09:34:39 20 pipeline -- the Palomar pipeline being only

21 secondary to the Bradwood facility, and its

22 main pipeline being the connection to Williams.

23 So I think you will hear, or already have heard

24 evidence perhaps last night, that the Williams

09:34:52 25 pipeline is possibly inadequate for the

28

09:34:56 1 capacity of Bradwood and, indeed, the main

2 pipeline may be Palomar.

3 The DEIS says that Palomar indicated that

4 its project is not dependent upon the

09:35:06 5 authorization or construction of the Bradwood

6 Landing project. If the Bradwood Landing

7 project is not authorized or not built, Palomar

8 could still serve the Portland metropolitan

9 area and extend its pipeline out of Northwest

09:35:18 10 Natural's Mist storage field. Palomar would

11 just not build the last segment between Mist

Page 24

PM2-10 The proposed sendout pipeline for the Bradwood Landing Project would connect to the Williams Northwest pipeline. The Palomar pipeline can be viewed as a system alternative (see our response to comment PM2-9). Regarding the Williams Northwest pipeline capacity, see our response to comment PM1-10.

PM2-11 The final EIS has been corrected to indicate that the only connection with the Mist storage field would be indirectly through Northwest Natural's local distribution system. It is only the last segment of the proposed pipeline to Bradwood Landing that would not be built if the Bradwood Landing Project is not authorized.

Public Meetings

2

K-66

PM2-11
cont'd

PM2-12

PM2-13

PM2 RN-110607-FERCam.txt

12 and Bradwood Landing.

13 And as I said earlier, I've been told by

14 Palomar that the Mist spur is off the table,

09:35:30 15 there's no such connection on the -- on the

16 plan at this point, and that the Clatsop County

17 portion of the pipeline would only be built if

18 Bradwood was built.

19 And then the DEIS goes on to say that FERC

09:35:45 20 would consider the Palomar project

21 independently, but I think, given the above, it

22 is clear that the Palomar pipeline is an

23 entirely foreseeable and possibly necessary

24 outcome of approving Bradwood and should be

09:35:57 25 considered in total or at least in part in the

29

09:36:01 1 Bradwood DEIS.

2 How much time do I have?

3 MR. FRIEDMAN: You've got 15 more seconds.

4 MR. MARC AVERBACH: Bradwood also makes a

09:36:06 5 big deal out of having made --

6 MR. FRIEDMAN: You don't have to speak

7 fast. You can slow down. I'll give you a few

8 more seconds.

9 MR. MARC AVERBACH: Bradwood makes a big

09:36:13 10 deal out of having made the site, at 40 acres,

11 as compact as possible. But in the book LNG --

12 I won't read the whole thing, but it's just

13 titled "LNG," on page 180, the SES project at

14 the Port of Long Beach is described as only 24

09:36:28 15 acres. Surely then Bradwood is not as compact

Page 25

PM2-12 We consider the Palomar pipeline as a system alternative in the EIS.

PM2-13 Every LNG facility is unique in its design. Section 3.1.6.2 describes NorthernStar's efforts to reduce the footprint of the Bradwood Landing LNG terminal.

Public Meetings

2

K-67

PM2-13
cont'd

PM2 RN-110607-FERCam.txt

16 as possible, and Bradwood should be required to
17 explore alternative locations as opposed to the
18 most compact design possible.
19 Thank you.
09:36:39 20 MR. FRIEDMAN: Thank you for your
21 comments.
22 All right. Is there anyone who did not
23 speak last night who would like to speak now?
24 All right. Now I'm going to call the
09:36:50 25 people who had a chance to speak last night.
30

09:36:52 1 So this is their second chance to speak again.
2 Mr. Dragich, you can go first, but please,
3 again, you have to say your name and spell it
4 for the court reporter.
09:37:03 5 MR. STEVE DRAGICH: Yes. Mr. Dragich,
6 D-R-A-G-I-C-H, speaking today as an ex-tactical
7 firefighter, first responder for the State of
8 Washington.
9 Specifically about a comment you made last
09:37:16 10 night, Mr. Friedman, about the clarity of the
11 maps and the information passed on to the
12 people that live adjacent and on top of the
13 pipeline. I'm resubmitting these maps that
14 were sent to me by your agency, FERC, in
09:37:33 15 December of 2005. I refer to your comment
16 about clarity. I'm sure you can see the route
17 of the pipeline. So I'm resubmitting these
18 back to FERC as inadequate.
19 (Handing document.)
Page 26

PM2-14

PM2-14 The maps of the pipeline route provided in Appendix B are at a standard (1:24,000) resolution that we believe is adequate to indicate the proposed route, but are not sufficient for detailed design purposes. The filed aerial alignment sheets (at a scale of 1:6,000) identify the detailed proposed route.

PM2-15 | 09:37:54 20 PM2 RN-110607-FERCam.txt
 21 MR. STEVE DRAGICH: My other comment deals
 22 with emergency response, specifically the
 23 connection in Cowlitz County in the state of
 24 Washington. The proponent, through the
 09:38:07 25 Northwest Natural Gas Industrial Association,
 filed suit against our utilities and 31

09:38:14 1 transportation commission, blocking the issuing
 2 of pipeline route maps, including to first
 3 responders, who have to respond to any incident
 4 that would happen to this proposal, should they
 09:38:31 5 happen at all.
 6 The presiding judge, Judge Hicks, Ronald
 7 Hicks, Superior Court, Thurston County,
 8 Washington, called the prevention of the issue
 9 of pipeline route maps, even to emergency
 09:38:47 10 response personnel, inane. The very next day,
 11 March 16th, 2007, the Northwest Industrial Gas
 12 Association appealed Judge Hicks's order to the
 13 appellate division of the appeals court,
 14 division 3, state of Washington.

09:39:08 15 On August 29th, when the land use hearings
 16 were proceeding in Clatsop County on this
 17 proposal, the Washington appeals court
 18 overturned Judge Hicks's decision. We will not
 19 be allowed any route maps in the state of
 09:39:24 20 Washington unless it's appealed to our
 21 Washington State Supreme Court.

PM2-16 | 22 In Cowlitz County alone there's been three
 23 incidences, major incidences, of the Williams
 Page 27

PM2-15 Section 4.11.9 addresses pipeline safety.

PM2-16 A discussion of regional pipeline incidents has been added to section 4.11.9 of the EIS.

Public Meetings

2

K-69

PM2-16

PM2 RN-110607-FERCam.txt

24 gas line exploding. Two I've witnessed
09:39:40 25 personally. As for the honesty of the pipeline
32

09:39:47 1 operators and the proponents, even in Cowlitz
2 County the incidences that we've had, in my
3 former department, the court records have been
4 sealed and the people living with this project
09:40:03 5 are not even allowed to see the incident
6 reports, even if you're an emergency responder
7 like myself.
8 So any integrity these people may have and
9 what's transpired just this past year totally
09:40:23 10 negates any honesty they may have in the
11 proposal like this.
12 MR. FRIEDMAN: Thank you for your
13 comments.
14 Next is Duncan MacKenzie.
09:40:34 15 MR. DUNCAN MacKENZIE: My name is Duncan
16 MacKenzie, M-A-C-K-E-N-Z-I-E.

PM2-17

17 Reference is made to the information
18 regarding cruise ship operations as noted on
19 table 4.8.1-5 on page 4-328 of the DEIS and as
09:40:49 20 discussed on page 4-332. The presented
21 information does not fully address the true
22 scope of all cruise ship operations associated
23 with the lower Columbia River affected by LNG
24 carrier operations.
09:41:00 25 As found in the DEIS, only the portion of
33

PM2-17 We have revised portions of the EIS to also discuss the river cruise vessels that travel between Portland and Astoria. These river cruise vessels are distinguished from the large ocean-going cruise ships which dock at Pier 1 and are specifically addressed by the WSR.

Public Meetings

2

K-70

PM2-17
cont'd

PM2 RN-110607-FERCam.txt

09:41:02 1 the river from the mouth of the Columbia River
2 to the Port of Astoria is considered. No
3 consideration is given to cruise ship
4 operations upstream from the Port of Astoria to
09:41:10 5 beyond river mile 38.
6 Two cruise ship lines currently operate on
7 the Columbia River between Portland and Astoria
8 on a regular and scheduled basis. Majestic
9 America Line, formerly known as America West,
09:41:24 10 operates the cruise ship EMPRESS OF THE NORTH,
11 QUEEN OF THE WEST, and COLUMBIA QUEEN. The
12 Cruise West division of West Travel
13 Incorporated operates the SPIRIT OF 98, the
14 SPIRIT OF DISCOVERY, and the SPIRIT OF ALASKA.
09:41:33 15 While these are not large cruise ships --
16 the largest being about 223 guests, 84 crew --
17 these ships have been in operation for a number
18 of years, carry tourists to several ports along
19 the Columbia and Snake rivers, adding not only
09:41:46 20 to the economies of Astoria and Portland, but
21 these ports of call as well. The itineraries
22 of these ships take them not only past the
23 Bradwood Landing terminal site, but places the
24 ships in the traffic pattern of the lower
09:41:59 25 Columbia River.

34

09:41:59 1 The Majestic America Line and Columbia
2 River Cruise Northwest Rivers has approximately
3 eight to ten sailings per month. A review of

PM2-17
cont'd

PM2 RN-110607-FERCam.txt
the combined schedules for Majestic America and
Cruise West notes a combined total of almost a
hundred sailings. The quantity of cruise ship
calls noted in the DEIS in the note table was
26 in 2006 and does not appear to include the
port calls arising from the operation of these
two cruise lines.

PM2-18

The economic report prepared by the
proponent's economic consultant does not
address the tangible economic impact of the
port calls and docking fees, nor does it
reflect the jobs represented by the direct crew
personnel, administrative personnel, or outside
vendors associated with the operation of these
ships.

PM2-19

Additionally, if as noted in the DEIS, a
cruise ship and an LNG vessel would not be
placed in a meeting situation as the proponent
factored the movements of the noted vessels
into the scheduling of construction dredging,
maintenance dredging, or LNG carrier
operations. In view of the significant

potential economic impact and scheduling issues
raised by the operations of these cruise ships,
it is recommended that the draft EIS be revised
to accurately reflect ongoing cruise ship
operation from Astoria to above Columbia River
mile 38.
MR. FRIEDMAN: Thank you, Mr. MacKenzie.

Public Meetings

2

PM2-18 We discuss potential impacts on the cruise ship industry in sections 4.8.1.7 and 4.8.1.8. We do not believe that the project would have any significant impacts on the cruise ship industry. Therefore, the economic benefits of cruise ships docking at Astoria would not be affected or lessened.

PM2-19 The Columbia River would not be closed to other users. The safety/security zone would establish the Coast Guard's authority in the area surrounding the LNG vessel to ensure safety during the transit. With proper scheduling of cruise sailings relative to LNG ship transits, the LNG ship traffic would not impact the cruise ships.

2

K-72

PM2-20

8 PM2 RN-110607-FERCam.txt
Next on my list is Vance Fraser.

9 MR. VANCE FRASER: Vance Fraser, spelled

09:43:19 10 F-R-A-S-E-R.

11 I have to say that it appears to me that

12 FERC was pushed into publishing this DEIS

13 prematurely. It doesn't present all of the

14 facts, nor many legitimate alternatives.

09:43:34 15 There's also a lot of erroneous information, so

16 much so that I question even the need for these

17 comment meetings at this time. I have never

18 seen such a biased love letter to the

19 benefactor of an EIS, and recommend FERC to go

09:43:50 20 back and hire an unbiased firm to do this DEIS.

21 This one's wholly inadequate.

PM2-21

22 I only skimmed through the DEIS last

23 night, and it is rife with wrong information

24 and bias. For example, on page 3-3, claims

09:44:06 25 that industries may not be able to change from
36

09:44:09 1 natural gas due to their equipment, this is

2 ridiculous. Industries that switch to natural

3 gas do so due to price, and they'll switch to

4 another type of energy found to be less

09:44:19 5 expensive and reliable. Those that cannot

6 afford a switch won't be able to afford the

7 natural gas when the prices rise.

PM2-22

8 Page 3-6, Trojan Nuclear Plant was not

9 closed, in large part, due to public opinion as

09:44:33 10 claimed. It passed a vote of the people and

11 was later shut down due to equipment failures.

Page 31

PM2-20 See our response to comment PM1-26. We believe the EIS is unbiased, produced by an independent staff, and presents all the facts necessary for an adequate environmental review, including alternatives (see Section 3). The draft EIS was not rushed into production. NorthernStar entered the Pre-filing review process in March 2005, filed its applications in June 2006, and the FERC issued the draft EIS in August 2007.

PM2-21 See our response to comment PM2-20.

PM2-22 The discussion of the Trojan nuclear power plant has been revised in section 3.1.1.3 of our final EIS.

Public Meetings

2

K-73

PM2-22
cont'd

12 One can infer that the cost to replace the
13 steam turbine generator was more than the
14 project profits for the life of the plant, or
09:44:46 15 the plant had more serious problems, or likely
16 a combination of both.

PM2-23

17 On page 3-36, if all that was claimed in
18 this section were true, then the Bradwood site
19 would certainly not be chosen. One part of
09:45:04 20 that, ships have to transit past Astoria, which
21 has residential waterfront. Number two,
22 minimal dredging would not be Bradwood. Kalama
23 has deep-water port. Partial availability is
24 mostly a function of price. Item four, it is
09:45:20 25 just as possible that an undisturbed site may
37

09:45:25 1 require less work than a previously disturbed
2 one. On proximity to existing interstate
3 pipelines that cross fewer bodies of water and
4 impact less wetlands, certainly wouldn't be
09:45:38 5 Bradwood. Kalama and Goebel area come to mind
6 and so on.

PM2-24

7 Page 3-32, the table has an "NA," not
8 applicable, for rough seas. Has FERC even
9 bothered to investigate problems at other
09:45:54 10 similarly situated LNG facilities? Apparently
11 not. Rough seas can be generated by passing
12 ship wakes. The table shows low environmental
13 impacts for Bradwood and the sendout pipeline,
14 which is basically preposterous. It completely
09:46:09 15 ignores the facts and is obviously biased.

Page 32

PM2-23 A project proponent selects the location for its proposed facilities, and the FERC analyzes the environmental impacts of constructing and operating those facilities at that location. Section 3.1.5.3 of our EIS presents the factors considered by NorthernStar in selecting the Bradwood Landing location for its proposed LNG terminal. We reviewed those factors and agreed that the proposed Bradwood Landing LNG terminal would be located on an available tract of land that was formerly the site of an industrial facility, situated in a mostly rural region that is not densely populated. Dredging at the proposed Bradwood Landing terminal would be less than at the proposed Oregon LNG terminal in Warrenton, and the Bradwood Landing sendout pipeline would be shorter than the pipeline proposed for the Oregon LNG Project. Kalama was not selected as the proposed project location because of the longer distance for LNG carrier transit, and other factors.

PM2-24 Section 3.1.4 of this final EIS compares the proposed site of the Bradwood Landing LNG terminal onshore to an alternative location off the Oregon coast. Studies (ABS) have shown that there are "rough seas" with large waves off the Oregon coast. The waves produced by ship wakes on the Columbia River are not comparable in size to weather produced waves offshore. Off the shore of Oregon, wave heights average between 5 and 10 feet. A recent study by the Port of Vancouver, Washington (Pearson et al., 2008) found that waves from ship wakes in the lower Columbia River average between 0.3 foot to 2.3 feet in height, with a mean height of 0.8 foot. Impacts on the CWTd and mitigation are described in section 4.6.

Public Meetings

2

K-74

PM2-24
cont'd

PM2-25

PM2-26

PM2-27

PM2-28

PM2 RN-110607-FERCam.txt
Bradwood impedes the necessary transit of
endangered white tail deer, the destruction to
the salmon grounds in this. It is also
interesting to note that in maps, Tenasillahe
Island is just noted as Tenasillahe Island
rather than as part of the white tail deer
refuge, and it's just across the river from
Bradwood.

How all the proposed pipeline impacts can
be considered low is also ridiculous. However,
38

one thing is clear from the table, that is
cost. FERC appears more than willing to
sacrifice our security, our lives, our jobs,
and our prosperity, and our property to save
NorthernStar money.

Page 3-49. The major pipeline route
alternatives must not include an alternative
facility site, nor other valid alternative
sites not included in this DEIS. There are
certainly pipeline routes which would cause
much less impact.

MR. FRIEDMAN: Vance, can you please wrap
it up.

MR. VANCE FRASER: What's that?

MR. FRIEDMAN: Can you wrap it up?

MR. VANCE FRASER: Sure. That's the end
of that. The jobs that I've heard, you know,
jobs considerations, basically I view them as
irrelevant. None of these job proponents care

Page 33

PM2-25 In numerous places the text indicates that Tenasillahe Island is part of the JBHNWR created to protect the Columbian white-tailed deer. See sections 4.6.1.1 and 4.7.1.4.

PM2-26 Cost considerations were only a minor component of our analyses. Safety, on the other hand, was a major consideration. See section 4.11.

PM2-27 The pipeline route alternatives were all assumed to originate at the proposed Bradwood Landing LNG terminal. As explained in section 3.1.8 of the final EIS, we did not identify another pipeline route alternative that offered significantly less environmental impacts than the route proposed by NorthernStar. The proposed Bradwood Landing pipeline would follow the existing KB pipeline for about 22 percent of its route, and we believe that following existing rights-of-way would minimize environmental impacts.

PM2-28 There is no evidence that this project would result in a loss of jobs. In fact, as discussed in section 4.8 (socioeconomics) the project would have economic benefits and would generate jobs. Nor should the project have significant negative impacts on commercial shipping in the waterway, as explained in section 4.8.1.7.

09:47:33 20 about my job or my neighbor's job is lost, only
21 that they may get a job or make some money; not
22 how much I and others may lose and all the
23 other businesses lose. If the good man really
24 cared about grain exporters, he'd be against
09:47:49 25 the project because they will be blocked by

39

09:47:52 1 this -- the ships transitting the river.
2 MR. FRIEDMAN: Thank you very much for
3 your comments.
4 At this time is there anyone else who has
09:47:59 5 something to say?
6 Yes, Marc. Go ahead. You have to restate
7 your name for the court reporter.
8 MR. MARC AVERBACH: Yes. My name's Marc
9 Averbach. You have the spelling.

09:48:12 10 This is the book I referred to earlier,
11 "LNG: A level-headed look at the liquified
12 natural gas controversy." It's generally
13 favorable to LNG, but it does make the

PM2-29

14 following point about -- on page 214: who is
09:48:25 15 looking out for us in the process of making
16 such decisions? No one is. This to me is the
17 most unfortunate part of the whole situation.
18 There's a long, drawn-out, and complicated
19 government mandated process to gain permit -- a
09:48:36 20 permit for an LNG import facility, with all
21 sorts of documentation required of all kinds of
22 issues.
23 But despite a sequence of federal -- of

Page 34

PM2-29 Project locations are selected by applicants, and the FERC conducts an independent environmental assessment. The Commission is ultimately responsible for authorizing a project, but only after it has determined that the project would be in the public convenience and necessity, and has considered the entire administrative record, including public comments, environmental effects, and non-environmental market data.

Public Meetings

2

K-76

PM2-29
cont'd

PM2-29 24 PM2 RN-110607-FERCam.txt
federal policies, most recently the Federal
09:48:47 25 Energy Policy Act produced in 2005, there was
40

09:48:50 1 no overall guidance as to where an appropriate
2 site might or might not be. No agency is
3 empowered to do any proactive planning.
4 Looking at the country as a whole and saying
09:49:01 5 the United States needs to have this many LNG
6 ports and these are the best locations for
7 them, so don't even bother talking to us about
8 siting an LNG facility anywhere else. This is
9 the most glaring error, among several.
09:49:13 10 And I think we feel -- speaking for people
11 who are opposed to this project, we kind of
12 feel under attack and inundated by numerous LNG
13 plants and pipelines, lots of mailings. I know
14 some of my neighbors have actually disregarded
09:49:30 15 some of the notices because they thought they
16 were related to Oregon LNG, and they didn't
17 realize it was a notice that they were actually
18 on a pipeline route. So it's becoming a little
19 bit overwhelming.

PM2-30 09:49:41 20 And I think also it's startling because we
21 think we're being put in line for LNG because
22 the market that really wants it, California,
23 doesn't want the facilities there, but then
24 we're stuck with them, and with a very
09:49:53 25 expensive infrastructure to pipe it all the way
41

PM2-30 See our response to comment PM1-23.

Public Meetings

2

K-77

PM2-31

PM2 RN-110607-FERCam.txt

09:49:55 1 to California.
2 One of the questions that FERC considers
3 in its Environmental Impact Statement is what
4 alternatives are there to this particular
09:50:05 5 project before -- that can fulfill the same
6 objectives? So far, they've shown a pattern of
7 tautologically answering in terms of the
8 project itself, with each EIS concluding that
9 the particular project under discussion is
09:50:19 10 best. An application says its goal is to
11 provide natural gas directly to a particular
12 market. So if another alternative wouldn't
13 provide natural gas directly to that market
14 but, rather, by pipeline, FERC says it was
09:50:33 15 incompatible.
16 And Bradwood engages in this kind of
17 tautologically -- tautological thinking when it
18 gives reasons why its site is particularly
19 suited to an LNG plant at that location. In
09:50:51 20 its property use application -- and it's before
21 Clatsop County -- they claim that the reason
22 the site was particularly desirable was it was
23 at river mile 39. Therefore, I assume saying
24 any other site that is not at river mile 39 is
09:51:05 25 not as suitable; that it has railroad access,
42
09:51:07 1 that it has dredge material disposal at the
2 site, that it's a relatively isolated location
3 and it has an existing dock. But actually
4 Skipanon LNG has none of these features.
Page 36

PM2-31 Our alternatives analysis concluded that none of the alternatives were clearly superior to the proposed action when considering environmental impacts and feasibility.

Public Meetings

2

PM2 RN-110607-FERCam.txt

PM2-31
cont'd

09:51:19 5 Therefore, Bradwood has not really
6 presented credible evidence that it has
7 thoroughly examined alternatives given the
8 least -- or the actual set of criteria that
9 define what's needed for an LNG facility.

09:51:31 10 Thank you.

11 MR. FRIEDMAN: Marc, thanks for your
12 comments, and I do have some thoughts on that.

13 Numerous people at various meetings that
14 I've attended have spoken on the issue of why

09:51:45 15 isn't the FERC looking at national planning?

16 And the reason is quite simple. Congress has
17 not given us that -- has not given us that
18 task. FERC only does what Congress tells us to
19 do. So there's the answer to that question.

09:52:03 20 I understand the feeling that Oregon --
21 the citizens of Oregon have been inundated with
22 numerous, competing in some cases, projects.
23 To some extent that's true. For those of you
24 who don't know the whole picture in Oregon,

09:52:20 25 there is an LNG facility currently proposed

43

09:52:22 1 before FERC in Coos Bay called Jordan Cove with
2 a pipeline that extends from there to Malin,
3 Oregon.

4 There is the Oregon LNG proposal. That's
09:52:36 5 in prefiling. That's at the Skipanon site.

6 And then there is this Palomar pipeline, which
7 is not an LNG proposal, but its pipeline does
8 parallel the sendout pipeline for Oregon LNG to

Page 37

K-78

Public Meetings

2

PM2 RN-110607-FERCam.txt

9 some extent through Clatsop and parts of the
09:52:54 10 willamette Valley, Clatsop County and parts of
11 the willamette Valley.

12 So the way it works is that FERC doesn't
13 think up these ideas. A project proponent
14 comes to the FERC and asks us to grant them
09:53:07 15 permission to build the facilities that they
16 are proposing. FERC then does analysis as to
17 what are the environmental impacts of those
18 proposals and ultimately what is the need for
19 it.

09:53:22 20 In many past cases, FERC has authorized
21 two competing projects that serve the exact
22 same marketplace and have similar environmental
23 impacts. I'll give you an example of what's
24 called the Wy-Cal pipeline and the Kern River
09:53:37 25 pipeline. They were both authorized. They
44

09:53:39 1 extended from Wyoming to California. Only one
2 of those projects got built because, in the
3 end, the market decides. But FERC was willing
4 to authorize both of them, and that's just the
09:53:51 5 way we operate.

6 Yes, sir. Is there a question in back?
7 Yes.

8 MR. VANCE FRASER: Yeah. About that part
9 about --

09:54:01 10 (Reporter requests clarification.)

11 MR. VANCE FRASER: Vance Fraser,
12 F-R-A-S-E-R.

Public Meetings

2

K-80

PM2 RN-110607-FERCam.txt

PM2-32

13 The comment about FERC only does what
14 Congress authorizes, if I'm not mistaken, Ron
09:54:12 15 Wyden asked you all to do some national work as
16 far as rating the different sites and that it's
17 been stated that -- I think by a FERC
18 commissioner, that about only seven LNG
19 facilities would be required in the whole
09:54:32 20 nation, and that you could do a rating and
21 check off the ones that would have the worst
22 impacts would be the lesser desired locations.
23 And I'd like to know what has happened with
24 that request.

09:54:48 25 MR. FRIEDMAN: Ron Wyden -- Senator 45

09:54:50 1 Wyden's comments letter is in the FERC record,
2 and so is the response from the Chairman of
3 Commission to Senator Wyden. Those are all
4 part of the public record, and you can read
09:54:58 5 those.

6 MR. VANCE FRASER: This is before that.

7 MR. FRIEDMAN: Yes, Marc?

PM2-33

8 MR. MARC AVERBACH: Yes. I think in
9 response to your suggestion that FERC doesn't
09:55:08 10 have the authority to look at national
11 planning, I think would be -- I guess if I were
12 on the other side, I would say that FERC
13 looking at the situation development should say
14 this is madness and ask for such authority.

PM2-34

09:55:23 15 And I think the fact that you authorize
16 multiple pipelines, I just want to say
Page 39

PM2-32

Joseph Kelliher, Chairman of the Commission, wrote an April 11, 2007 response to Senator Wyden's March 6, 2007 letter. These letters are in the public record for this proceeding. In response to questions raised in March 7, 2008 by members of Oregon's Congressional Delegation about regional planning, Chairman Kelliher wrote letters on April 2, 2008 indicating that the FERC reviews natural gas applications individually, on their own merits, to assess site-specific impacts.

PM2-33

See our response to comment PM2-32.

PM2-34

As described in section 3.1.2.2, the Palomar pipeline is a separate project from the Bradwood Landing Project with a different purpose.

Public Meetings

2

18-K

PM2 RN-110607-FERCam.txt

17 personally, that even drawing a line across a
18 property, even if a pipeline isn't ultimately
19 built or the location is changed, has
09:55:34 20 tremendous impacts on those people affected,
21 speaking personally. It's not -- it's not
22 benign to simply draw a line across somebody's
23 property, as the line for Palomar transects my
24 property. It's a very disturbing situation and
09:55:50 25 has real effects on people.

46

PM2-35

09:55:52 1 MR. FRIEDMAN: Thank you for your
2 comments.
3 You can stand up, state your name for the
4 record, and provide us your comments.
09:55:59 5 MS. BRANDY HUMPHREYS: Brandy Humphreys,
6 H-U-M-P-H-R-E-Y-S. I'm with the Confederated
7 Tribes of Grand Ronde, and I just have a
8 question about analysis, talking about multiple
9 pipelines. Is there a cumulative analysis?
09:56:16 10 MR. FRIEDMAN: Yes, there is a section in
11 the DEIS on cumulative impacts.
12 MS. BRANDY HUMPHREYS: Okay.
13 MR. FRIEDMAN: Are there any more comments
14 or questions from the floor?
09:56:26 15 Yes, Duncan. Please, you have to state
16 your name again.

PM2-36

17 MR. DUNCAN MacKENZIE: Duncan MacKenzie.
18 There is a water usage table presented in
19 the DEIS on page 4-53 as table 4.3.1-1.
09:56:39 20 Submerged combustion vaporizers use a water
Page 40

PM2-35 Cumulative impacts are discussed in section 4.12.

PM2-36 SCVs would be subject to various maintenance checks throughout the life of equipment. Draining of the water bath for maintenance inspections is expected to occur once per year. The unit would likely be refilled with the produced water from the other vaporizers.

Public Meetings

2

K-82

PM2-36
cont'd

PM2 RN-110607-FERCam.txt

21 bath surrounding stainless steel LNG vaporizer
22 tubes as a transfer medium. Noted in this
23 table and as found in the applicant's resource
24 report two, table 2-1, it will take
09:56:52 25 approximately 200,000 gallons of water to
47

09:56:54 1 charge the submerged combustion vaporizing
2 water valves.
3 However, not found in the DEIS or any of
4 the available information for public review is
09:57:03 5 any accounting of the water required to refill
6 the vaporizer unit, approximately 29,000
7 gallons after it has been serviced, nor is the
8 draining of the vaporizer tank taken into
9 account in the noted DEIS table.
09:57:14 10 Reference is made to the following
11 operational narrative text found in the
12 applicant's resource report 13 at Section
13 13.7.3.4 on page 13-32. The vaporizers are
14 arranged in parallel. Under normal operation,
09:57:27 15 only six units are in operation. The remaining
16 unit acts as a spare to enable ongoing
17 maintenance, changeout of water baths, and to
18 cover single unit down time without impacting
19 on the terminal sendout capacity.
09:57:40 20 No schedule or other information as to the
21 frequency of this maintenance procedure and the
22 changeout of water baths was found in the
23 applicant's materials for public review.
24 Furthermore, it is not known if the applicant
Page 41

Public Meetings

2

K-83

PM2-36
cont'd

PM2 RN-110607-FERCam.txt

09:57:53 25 intends to sequester the water drained from the
48

09:57:55 1 vaporizer tank and then restore it to the tank
2 after maintenance. Therefore, an accurate
3 assessment of the water resource impact this
4 procedure may have over the course of the year
09:58:02 5 or the expected lifetime of the facility cannot
6 be made.
7 The National Marine Fisheries Service has
8 also noted this operational aspect, as found in
9 their request for additional information for
09:58:12 10 Bradwood Landing LNG terminal on page 10, lines
11 22 through 25. The applicant has not responded
12 to this question in any of its four responses
13 to the National Marine Fisheries Service
14 request. It is not known if this response is
09:58:24 15 contained in the nonpublic document for
16 exception number 20071016-0235.
17 It is also noted that the applicant and
18 the National Marine Fisheries Service have a
19 continuing and ongoing dialogue. However, it
09:58:39 20 is recommended that prior to the preparation of
21 the FEIS, the applicant fully identify and
22 quantify all water usage, intake and discharge,
23 to the Commission.
24 MR. FRIEDMAN: Thank you very much for
09:58:48 25 your comments.
49

Public Meetings

2

K-84

09:58:48 1 PM2 RN-110607-FERCam.txt
Are there any more comments from people
2 who have not yet spoken?
3 If not, Mr. Dragich, you would like to
4 speak again?

09:59:01 5 MR. STEVE DRAGICH: Yes, I would.

PM2-37

6 The question was made to compensation to
7 landowners. The original filing for the
8 certificate in June of 2006, on page 88 in the
9 original filing, the proponent listed, just for
09:59:20 10 the pipeline, total compensation of \$186,000.
11 Using the industry standard found in the
12 Pipeline Risk Management book, edition 1992, by
13 Muhlbauer, what's the price of a human life
14 according to the industry's own estimate? In
09:59:42 15 that edition of 1992, you'll see a listing of
16 \$1.5 million per life.

PM2-38

17 My last comment concerns credibility of
18 the proponent. You've heard about the Palomar
19 pipeline, which the proponent didn't have or
10:00:01 20 was stated as not having any connection to. In
21 August of this year, the people in Washington
22 along the pipeline route were contacted by an
23 independent exploratory company called Maverick
24 Petroleum, associated with Venoco.

10:00:24 25 At the time the proponent said they had
50

10:00:27 1 nothing to do with this proposal, Bradwood LNG;
2 yet through Securities and Exchange filings we
3 find out that Venoco owned the platform known
4 as the Clearwater project, which NorthernStar

PM2-37 See our response to comment PM2-4.

PM2-38 This comment is outside the scope of the EIS, as it is not an environmental issue.

Public Meetings

2

K-85

PM2-38
cont'd

10:00:44 5 PM2 RN-110607-FERCam.txt
was backing in California. Yet we were told
6 that they had no connection to Bradwood LNG
7 through NorthernStar. This goes to
8 credibility.
9 MR. FRIEDMAN: Thank you for your
10:00:58 10 comments.
11 All right. Is there anyone else who has
12 not -- yes, sir. State your name for the
13 record, please.
14 MR. WALT MULTANEN: Walt Multanen,
10:01:07 15 M-U-L-T-A-N-E-N, landowner.
PM2-39
16 If there is to be LNG on this river, I
17 stand to enjoy roughly 2,000 feet of the
18 proposed pipeline. I have but one simple
19 question: If there is a loading site in Alaska
10:01:29 20 at the present time and there is to be LNG on
21 this river, would it be within FERC's authority
22 or somebody's authority to insist that only
23 Alaska natural gas come to Bradwood?
24 MR. FRIEDMAN: I don't know the answer to
10:01:47 25 that question.
51
10:01:48 1 MR. WALT MULTANEN: Well, end of comment,
2 but if you're going to have natural gas, it
3 would seem -- well, I hate to use the term
4 "common sense," but I have to -- that just
10:01:59 5 common sense would prevail, and you would keep
6 whatever monies you can within your own
7 economy.
8 MR. FRIEDMAN: I understand your comment,
Page 44

PM2-39 Under section 3 of the NGA, NorthernStar does not have to state the source of its LNG. The Bradwood Landing import terminal could receive LNG shipments from any exporting country, but we expect that the most likely sources would be from the Pacific Basin, including Alaska. However, the FERC would not require a single source of LNG.

Public Meetings

2

9 PM2 RN-110607-FERCam.txt
and I appreciate it.

10:02:09 10 MR. WALT MULTANEN: There is no such thing
11 as cheap energy on the face of this Earth any
12 longer. That's in days past.

13 MR. FRIEDMAN: When I don't know the
14 answer to a question, that doesn't mean that we
10:02:20 15 won't address it in the EIS; it just means I
16 won't address it now off the top of my head.

17 If there are no more questions from people
18 who have not yet spoken, at this time I'd like
19 to close the meeting. I want to thank you all
10:02:32 20 for being here. And let the record show that
21 this meeting was closed at approximately 10
22 o'clock a.m. Thank you.

23 (MEETING ADJOURNED AT 10:02 A.M.)

Public Meeting Transcript of Proceedings
Tuesday, November 6, 2007, 6:30 p.m.
Cathlamet, Washington

The introductory comments for this public meeting are not included in the FEIS because they are very similar to those of the Monday, November 5, 2007, 6:30 p.m. meeting in Cathlamet, Oregon, which are included. The complete transcript of the Tuesday, November 6, 2007, 6:30 p.m. meeting in Clatskanie, Washington can be obtained at the FERC's internet website (www.ferc.gov) using the eLibrary link. Click on the eLibrary link, click on "General Search," and enter the docket number excluding the last three digits in the Docket Number field (i.e., CP06-366). Be sure you have selected an appropriate date range. For assistance, please contact FERC Online Support at FERCOnlineSupport@ferc.gov or toll free at 1-866-208-3676, or for TTY, contact (202) 502-8659.

Public Meetings

3

PM3 RN-110607-FERCpm.txt

18:53:55 1 on the speaker's list, if you've not already
2 done so. After we've given you that
3 opportunity, we'll start taking comments from
4 the floor. Thank you.

18:56:01 5 (Recess.)

6 MR. FRIEDMAN: All right. Now is the time
7 you've been waiting for. It's where you get to
8 give us an earful, what your opinions are about
9 the project. We want to hear what you have to
10 say about the DEIS.

11 I'm going to call people in the order in
12 which they signed up, and I will ask that when
13 you come up to the podium, as you can see --
14 when I used the microphones, it didn't work
15 very well. So you're going to have to speak up
16 in your loud voice in case the microphones
17 don't pick up your soft voice. The court
18 reporter needs to hear you, so you might have
19 to speak slower than I did. I tend to speak
20 too fast. You won't be penalized for your
21 three minutes by speaking slowly and
22 enunciating.

23 Clearly state your name, spell your last
24 name for the court reporter, identify any
19:00:31 25 organization you may represent or yourself, if
18

19:00:35 1 you're an individual. Please tell us if you're
2 a landowner along the pipeline, and if you

Public Meetings

3

K-92

PM3 RN-110607-FERCpm.txt
3 happen to know the milepost that your land is
4 located on, please tell us that. If you don't
19:00:44 5 know your milepost, there are some NorthernStar
6 people in the back who might be able to locate
7 your land according to milepost, or you can
8 take a look at the DEIS, which has maps with
9 mileposts on it.

19:00:56 10 That said, the last time I was here there
11 was a certain individual who raised her hand
12 all night long, and I kept forgetting to call
13 on her, and tonight she's first on the list.
14 Paula Carlson. You thought I forgot, Paula.

19:01:14 15 MS. PAULA CARLSON: All right. And I
16 didn't want to be first. I signed up as
17 fourth.

18 My name is Paula Carlson. My last name
19 C-A-R-L-S-O-N. I live on Puget Island.

PM3-1 19:01:29 20 The pages that I selected to talk about
21 are page 4-388 and 4-389. NorthernStar has
22 submitted data regarding ambient noise at the
23 west end of Puget Island, which I do not
24 believe is correct. Thus, the conclusions from

19:01:47 25 their data used to project levels of acceptable
19

19:01:50 1 noise from construction and operation of the
2 facility and noise from LNG tankers docking and
3 undocking is based on false premises.

4 I charge that NorthernStar's numbers have
19:02:01 5 been massaged, and I question whether they have
6 factored water into their calculations properly

PM3-1 See our responses to comments PM1-46 and PM1-47.

Public Meetings

3

K-93

PM3-1
cont'd

PM3 RN-110607-FERCpm.txt

7 as a hard site, a condition which will not
8 reduce noise over distance since water, like
9 cement, offers nothing that can absorb the
19:02:17 10 sound energy from their site to the affected
11 residents of Puget Island.
12 It appears that, in order to meet federal
13 guidelines during construction and during
14 operation of the proposed facility, it has
19:02:29 15 fallen upon the company to be selective with
16 the data they have gathered to avoid an
17 accurate interpretation of ambient and
18 background noise and their formulations, and
19 construct their own numbers to fit the grid.
19:02:44 20 Experience living on the island and tuning
21 into the silence or to the breaking of the
22 silence by intermittent ship traffic and
23 occasional dredging of the channel tells me
24 that the majority of the time we, at the west
19:02:57 25 end of the island, are not as high on the noise
20
19:03:00 1 level as NorthernStar states. If I'm right --
2 and I assert that I am -- then NorthernStar
3 cannot meet the guidelines set forth federally
4 through EPA and their application should be
19:03:14 5 denied.
6 Since a portion of the island is so close
7 to the site, to the main shipping channel, and
8 to the berthing maneuvers that NorthernStar has
9 outlined, the data and the analysis of noise
19:03:24 10 and sound must be scrutinized. The hard-site

Public Meetings

3

K-94

PM3-1
cont'd

PM3 RN-110607-FERCpm.txt
11 conditions which exist cannot be ignored. It
12 is a proven fact that noise adversely affects
13 the physiological well-being of the community.
14 Thank you.
19:03:37 15 MR. FRIEDMAN: Thank you for your
16 comments.
17 Next is Steve Fluke.
18 MR. STEVE FLUKE: Steve Fluke, F-L-U-K-E.
19 Better spell it okay.
19:03:51 20 First, I'm here as a citizen, and I
21 live -- I don't live on the river here. I live
22 over by Raymond. My kids go to Willapa Valley.
23 I know there's a lot of Mules here. You know
24 the Vikings, I'm sure. This is a pretty tough
19:04:06 25 group of kids my kids play. All my kids have
21
19:04:09 1 played over here.
2 Anyway, I'm here as a citizen, but I'm
3 also here as a representative of a major union,
4 and that's the machinists' union. I represent
19:04:16 5 here in the state of Washington -- I'm a
6 vice president here on the West Coast, even
7 though I live in the (inaudible) area. I
8 represent the aerospace workers here. I
9 represent the loggers and mill workers on this
19:04:27 10 river here to the tune of about 42,000 members
11 and the families. That's a pretty good group
12 of people that I'm here representing.
13 Obviously -- I know we're not supposed to
14 say whether we support or not. Supposedly you

PM3-2 19:04:39 15 PM3 RN-110607-FERCpm.txt
 16 don't give any weight to that. We do. We're
 PM3-3 17 supportive because obviously there's a lot of
 18 jobs. But one thing that's particularly
 19 important to me that we've looked at, and since
 19:04:51 20 I've worked primarily in the logging and
 21 milling industry here in Washington and Oregon,
 22 is the restoration program that they're
 23 proposing to do. That's a lot of money.
 24 They're proposing \$50 million for restoration
 19:05:08 25 work. I've worked all the way from Queets all
 the way down through Oregon, trying to work on
 22

19:05:10 1 rivers that supposedly were destroyed by -- by
 2 logging, but every time we've got a little bit
 3 of money, we've ran out of it.
 4 I think a company that brings in a
 19:05:19 5 proposal to put that kind of money along this
 6 river to restore some of these wildlife areas
 7 and some of these -- these torn-up riparian
 8 zones is pretty unique, because we brought in a
 9 lot of industry in this -- up and down this
 19:05:34 10 river, and I don't know they brought any money
 11 to help with that restorative process.
 12 So as far as the environment goes, I've
 13 worked -- I've dealt with environmentalists
 14 through the spotted owl crisis, from here in
 19:05:48 15 Washington and Oregon. I've lost a lot of
 16 mills. I know that people are very sensitive
 17 about the environment, but if you take a look
 18 at the background, we've had our machinists --

PM3-2 Comment noted.

PM3-3 Comment noted.

Public Meetings

3

K-96

PM3-3
cont'd

PM3 RN-110607-FERCpm.txt

19 we have a group back in Washington, D.C. that
19:06:03 20 does a lot of -- a lot of investigation on
21 different companies, and you take a look at
22 this company and they're pretty sound
23 environmentally, both safetywise and
24 environmentally.
19:06:13 25 So we're proposing and we're asking that
23

19:06:15 1 this Commission move on with this process and
2 let this project get going. Thank you.
3 MR. FRIEDMAN: Thank you for your
4 comments.

19:06:24 5 Next on the list is Esther Gregg. By the
6 way, if I mispronounce your name, please
7 correct me.

8 MS. ESTHER GREGG: Thank you. I'm Esther
9 Gregg, G-R-E-G-G. I live in the west end of
19:06:43 10 Wahkiakum County, and I do not own property on
11 the pipeline.

12 I am a Wahkiakum County PUD Commissioner,
13 but I'm here before you this evening
14 representing the Washington State Grange. This
19:06:57 15 year in June at its 108th annual conference, we
16 had 283 voting delegates representing
17 approximately 45,000-plus members within the
18 state of Washington grange. A resolution was
19 brought before the floor, and I'd like to read
19:07:13 20 it into the record, if I might, please.

PM3-4

21 "Whereas, NorthernStar Natural Gas is
22 seeking to develop a liquefied natural gas

Page 20

PM3-4 There is no evidence that the proposed pipeline would adversely impact property values. Please see section 4.8.3.3. Land use is discussed in section 4.7.3.

PM3-4 23 PM3 RN-110607-FERCpm.txt
 cont'd 24 import terminal at Bradwood in a 34-mile
 19:07:30 25 sendout pipe through southwest Washington that
 will adversely impact the land values, 24

19:07:33 1 customary use, and property right of many local
 2 landowners; and

PM3-5 3 "whereas, NorthernStar's project will use
 4 eminent domain against landowners and its

PM3-6 19:07:43 5 pipeline will damage productivity of the
 6 100-foot-wide right-of-way for timber,
 7 agriculture, and wildlife habitat; and

PM3-7 8 "whereas, NorthernStar's project is an
 9 unnecessary supply for Washington state. The
 19:07:56 10 gas from this terminal is for California, who
 11 reject LNG terminals being built in their
 12 state; and

PM3-8 13 "whereas, NorthernStar's terminal and
 14 pipeline are inconsistent with maintaining
 19:08:10 15 adequate public safety and security in the
 16 lower Columbia River area. The 34-mile,
 17 high-pressure, non-odorized gas pipeline and
 18 the LNG terminal presents significant
 19 unresolved safety and emergency response
 19:08:25 20 infrastructure concerns that NorthernStar
 21 refuses to resolve in a timely manner; and

PM3-9 22 "whereas, NorthernStar's terminal and
 23 pipeline undermines state and local economic
 24 interests as landowners, river users, and small
 19:08:39 25 businesses will bear the economic cost of
 25

Public Meetings

3

- PM3-5 The use of eminent domain as it relates to this project is discussed in section 4.7.3.1. See our response to comment PM2-4. There is no evidence that the project would significantly damage productivity of timber, agriculture, and wildlife habitat. After restoration, the right-of-way should be returned to its pre-construction condition and use.
- PM3-6 As discussed in section 4.8.3.3, NorthernStar would compensate the landowner for use of the land. The easement agreement between NorthernStar and the landowner would specify compensation for damage to property during construction, loss of use during construction, and loss of renewable and nonrenewable or other resources. Congress has authorized the use of eminent domain by natural gas pipelines certificated by the FERC under section 7h of the NGA.
- PM3-7 Section 1.1 has been revised to include information indicating that the majority of natural gas supplied by the proposed project would go to consumers in Oregon and Washington.
- PM3-8 The project will be constructed and operated in accordance with applicable federal, state, and local regulations including safety and security standards. A discussion of reliability and safety is provided in section 4.11.
- PM3-9 There is no evidence that the project would have negative impacts on the local and state economy, and it may in fact have economic benefits. Delays for commercial ship traffic would be minor, and should not result in an increase for shipping costs. See section 4.8. The costs for security would mainly be borne by NorthernStar through the cost-sharing agreement spelled out in its ERP, as discussed in section 4.11.6.

PM3 RN-110607-FERCpm.txt

PM3-9 19:08:42 1 increased security and delays in river traffic,
cont'd 2 creating increased shipping costs for any
3 agriculture or other products being shipped on
4 the Columbia River; and

PM3-10 19:08:53 5 "whereas, the LNG terminal will exacerbate
6 pollution and damage critical salmon habitat in
7 the Columbia River estuary, a vital nursery for
8 salmon; and

PM3-11 9 "whereas, the Washington State Grange
19:09:07 10 recognizes the need in the Pacific Northwest
11 for clean, safe, affordable energy but finds
12 NorthernStar's project to be destructive,
13 unnecessarily risky, and a cause for extra
14 expense to agriculture and other products using
19:09:22 15 Columbia River ports for shipping.

PM3-12 16 "Therefore, be it resolved that the
17 Washington State Grange urges the Federal
18 Energy Regulatory Commission and all relevant
19 Washington and Oregon agencies to deny site
19:09:36 20 approval and all permits for the Bradwood
21 Landing LNG terminal and pipeline."

22 This resolution was passed unanimously at
23 the Washington State Grange this summer, as I
24 say, and in response to the -- to the nature of
19:09:51 25 the historic nature of Washington State Grange,

26

19:09:54 1 in passing a resolution, we believe in "say
2 one, say all." So it's safe to say that the
3 Washington State Grange's 45,000-plus members
Page 22

Public Meetings

3

PM3-10 As section 4.10 of the EIS explains, the proposed project would not be a major source of pollution, and would not have significant impacts on regional air quality. Impacts on salmon and the lower Columbia River estuary, and mitigation for those impacts, are discussed in sections 4.3.2, 4.5, and 4.6.

PM3-11 There is no evidence that the proposed project would cause extra expenses to the shipping of agricultural products. See response to comment PM3-9.

PM3-12 See our response to comment PM2-3.

Public Meetings

K-99

PM3-12 | cont'd

PM3 RN-110607-FERCpm.txt

4 would support, in whole, this resolution to not
 19:10:09 5 site the Bradwood Landing plant.
 6 Thank you.
 7 MR. FRIEDMAN: Thank you. Next on the
 8 list is --
 9 MS. CAROL KRIESEL: -- is Carol Kriesel.
 19:10:27 10 MR. FRIEDMAN: All right. Thank you,
 11 Carol.
 12 SPEAKER: Hi, I'm Carol Kriesel,
 13 K-R-I-E-S-E-L, resident of Puget Island.
 PM3-13 | 14 I will point out inconsistencies contained
 19:10:44 15 in the DEIS regarding distance between Puget
 16 Island and the proposed site in Bradwood,
 17 Oregon. On page 28, it is stated that the
 18 nearest residents are about .6 miles. On page
 19 469 it says no residences are present within
 19:11:03 20 .05 -- .5 miles. And on page 574, in table
 21 4.10.2-5, the distance from the proposed site
 22 to Puget Island is listed as 1,000 feet.
 23 I want NorthernStar to demonstrate how
 24 they arrive at those different figures and what
 19:11:24 25 coordinates they used. Just stating the
 27
 19:11:27 1 information without a basis for the
 2 determination makes it invalid, and to concede
 3 there are two main areas that need to be
 4 corrected by NorthernStar: The inconsistencies
 19:11:39 5 and the information used to gather the data.
 PM3-14 | 6 My second point, the project proposed by
 7 NorthernStar to be sited in Bradwood, Oregon,
 Page 23

PM3-13 The Executive Summary has been revised to state that the nearest residence is 0.5 mile from the LNG terminal site. The distance referenced in table 4.10.2-5 is from the nearest NSA located on Puget Island (referred to as N2, a group of riverfront homes) to the NorthernStar property line as shown on figure 4.10.2-1.

PM3-14 The operational size of the Bradwood Landing LNG terminal is smaller than many other currently operating or proposed LNG terminals.

Public Meetings

3

K-100

PM3-14
cont'd

PM3 RN-110607-FERCpm.txt

8 is not small to medium-sized. The following
9 quotes with page numbers from the DEIS
19:11:55 10 demonstrate that this is a large project.
11 Page 162, quote: A type of low-profile
12 LNG storage tank referred to as an LNG smart
13 horizontal tank storage has been developed by
14 Mustang Engineering but has not been used on a
19:12:13 15 scale as large as the proposed project.
16 Page 165: Because a service area of the
17 heat exchangers needs to be large for efficient
18 heat transfer, the structures would be large
19 and require significant space for construction
19:12:30 20 and operation.
21 Page 266: Potential impacts on water
22 quality resulting from boring operations would
23 be due to the relatively large work areas.
24 Page 328: Due to the very dynamic nature
19:12:47 25 of large-scale construction, NorthernStar has
28

19:12:51 1 not defined specific lighting plans for
2 construction.
3 Page 562: Most large energy facilities in
4 Oregon are under the jurisdiction of the Oregon
19:13:03 5 Energy Facility Siting Council.
6 Page 565: Motor vehicles are a primary
7 source of air pollution, with large industrial
8 facilities accounting for less than 15 percent
9 of those types of criteria pollutants.
19:13:20 10 Finally, there are four pages with the
11 same phrase, page 276, page 283, page 329, and
Page 24

Public Meetings

3

K-101

PM3-14 | cont'd

PM3 RN-110607-FERCpm.txt

12 page 350. They say: For any large
 13 construction project, there is a potential for
 14 spills or leaks.

19:13:35 15 As you can see, FERC refers to this as
 16 large. It is not small- to medium-size. Thank
 17 you.

18 MR. FRIEDMAN: Thank you for your
 19 comments.

19:13:56 20 All right. Hopefully we get this right.
 21 Mieke Eykel.

22 MS. MIEKE EYKEL: That's Mieke.
 23 MR. FRIEDMAN: Mieke. I'm sorry, Mieke.
 24 UNIDENTIFIED SPEAKER: Please use a mike.

19:14:18 25 MS. MIEKE EYKEL: My name is Mieke Eykel.
 29

19:14:20 1 Last name is E-Y-K-E-L. And I'm here in
 2 opposition. I am strongly opposed.

PM3-15 | 3 The DEIS states no residences within a
 4 half a mile of the proposed LNG facility. But
 19:14:36 5 my concern, as a residence within half a mile
 6 of the closest LNG source, this would be LNG
 7 carrier unloading at dockside. This closest
 8 LNG source is 2500 feet from my house and may
 9 be even closer to some of our neighbor's
 19:14:57 10 places.

11 Why is the half-mile criteria so important
 12 to NorthernStar? Are these issues -- are there
 13 issues within half a mile or less distance to
 14 an LNG terminal source? And other issues are

PM3-16 | 19:15:13 15 side pollution. The submersed vaporizers in
 Page 25

PM3-15 There is no special criterion of residences within one-half mile of the site. We are sensitive to residences overlapped by the Zones of Concern. As the LNG carriers move into the Bradwood dock from the waterway, the distances to houses change during the transit. The EIS discloses the number of houses overlapped by Zone 1 along the waterway and at the berth. The project would meet all applicable air quality standards and the requirements of its air quality permit.

PM3-16 The figures we show in this EIS include the exhaust stacks that would be constructed at the proposed LNG terminal.

Public Meetings

3

K-102

PM3 RN-110607-FERCpm.txt

PM3-16
cont'd 16 NorthernStar's handouts do not show the large
17 exhaust stacks, six or ten of them. Why are
18 these not shown?

PM3-17 19 And then existing -- existing residences.
19:15:28 20 Your FERC statement of construction and
21 operational impact on the dense communities is
22 short-term and not significant. I disagree
23 with the statement as the facility is to
24 operate for the next 30 to 40 years. As a
19:15:41 25 matter of fact, it reflects -- to the effects
30

19:15:44 1 on how quiet this area is, one can hear
2 people's conversation on the other side of the
3 river, or any other activity.

PM3-18 4 And the potential erosion to Puget Island
19:15:58 5 shoreline would be very significant due to
6 berthing in the LNG areas, especially as
7 berthing is accomplished at high tide. Why is
8 this issue not mitigated with the property
9 owners in Wahkiakum County?

19:16:11 10 Thank you.
11 MR. FRIEDMAN: Thank you for your
12 comments, Mieke.
13 Robert Larson.
14 MR. ROBERT LARSON: Robert Larson. I live
19:16:24 15 20 miles at --
16 (Reporter requests clarification.)

PM3-19 17 MR. ROBERT LARSON: L-A-R-S-O-N. And my
18 question is part of the process. I was
19 wondering how deep will the navigation channel
Page 26

PM3-17 The EIS states that potential impacts from the Bradwood Landing LNG terminal could be caused by short-term increases in noise during construction and increases in noise due to operation of the project in the long term. Noise from the LNG terminal may be perceptible during relatively quiet periods. However, NorthernStar would be required to meet the FERC's 55 dBA L_{dn} restriction at NSAs.

PM3-18 Shoreline erosion along Puget Island is addressed in section 4.1.3.3. We have added a recommendation that NorthernStar prepare a Shoreline Monitoring Plan for the west end of Puget Island.

PM3-19 The horizontal directional drill would be at least 50 feet below the Columbia River bed. Exact depth would be determined during engineering design of the drill.

Public Meetings

3

K-103

PM3-19 | 19:16:46 20 of the Columbia River, the pipeline, will be
cont'd | 21 put in if the process goes ahead?
22 MR. FRIEDMAN: Thank you.
23 Does anyone from NorthernStar know the
24 answer to that? How deep is the horizontal
19:17:02 25 directional drill under the Columbia River?
31

19:17:04 1 SPEAKER: We couldn't hear the question
2 back here, Paul.
3 MR. FRIEDMAN: The question was: How deep
4 is the horizontal directional drill below the
19:17:12 5 Columbia River? Do you know the answer?
6 MR. GARY COPPEDGE: It's at least 50 feet.
7 (Reporter requests clarification.)
8 MR. FRIEDMAN: Gary C-O-P-P-E-D-G-E. His
9 comments was at least 50 -- you said at least
19:17:31 10 50 feet?
11 MR. GARY COPPEDGE: Yeah. It varies.
12 That's a difficult question to answer in one --
13 MR. FRIEDMAN: All right. At the FEIS,
14 we'll do some more research, and we'll provide
19:17:42 15 a more detailed answer.
16 Franz, your turn.
17 MR. FRANS EYKEL: Good evening. Thank you
18 for commenting on the FEIS.
19 MR. FRIEDMAN: State your name first.
19:18:20 20 MR. FRANS EYKEL: Excuse me?
21 MR. FRIEDMAN: State your name and spell
22 your last name.
23 MR. FRANS EYKEL: Franz Eykel, E-Y-K-E-L,
Page 27

PM3 RN-110607-FERCpm.txt

24 Puget Island resident.

PM3-20 19:18:29 25 My reference is to 4.7.2.3, existing
32

19:18:33 1 residences. It's about risk perception. Risk
2 perception amplifies the impact of a
3 disability. Public perception of risk and
4 nuisance effects have a measurable economic

19:18:49 5 consequence. One direct impact associated with
6 risk likely to be experienced by landowners and
7 residents in the area, real estate values may
8 decline. And should propose LNG terminals be
9 approved, is an increase in insurance premiums
10 of available insurance coverage available?

11 Accidents that threatens the value of the
12 land in the community impacts the long-term
13 fiscal -- fiscal health of the community,
14 industrial development, including electrical
15 power plants, oil refineries, and LNG
16 facilities are found to be -- to be associated
17 with a decrease in property values, of
18 properties within approximately a two-mile
19 radius.

PM3-21 19:19:42 20 The fact is it creates is a disamenity,
21 including spacial effects, noise, lights,
22 traffic, air pollution, shoreline erosion, and
23 odors. Tourists -- tourists can be very
24 sensitive to amenities of an area and to the
19:20:02 25 perceived reputation and character of a
33

Public Meetings

3

PM3-20 We discuss the potential impact of the LNG terminal on property values in section 4.8.2, and safety in section 4.11.

PM3-21 As discussed in section 4.8.1.8, we believe the proposed project would not have a significant impact on tourism in the project area. Lighting and visual impacts are addressed in section 4.7.2.7. Shoreline erosion is discussed in section 4.2. Noise and air pollution are addressed in section 4.10.

Public Meetings

3

PM3 RN-110607-FERCpm.txt

19:20:05 1 community. LNG or like facilities are a
2 disamenity to this area.

PM3-22

3 Militarizing the river due to LNG carrier
4 escorts will have a serious scheduling effect
19:20:19 5 on the upriver cruise ship business and other
6 perceived risks and a disamenity. NorthernStar
7 Natural Gas writes off the dollar values of
8 jobs and tax revenues, but they fail to enter
9 the dollar values of the disamenities.

PM3-23

19:20:41 10 Mitigation. The citizens of Puget Island
11 and their properties are negatively affected by
12 the proposed Bradwood Landing facility by the
13 above-mentioned factors, but no attempt has
14 been made to mitigate or compensate for the
19:20:58 15 anticipated decreases in property values.

16 As far as representation, our county
17 commissioners have intervenor status with the
18 FERC, but due to the lack of representation we,
19 the people, have to speak out on these issues
19:21:16 20 and represent our interests and of the others
21 in our the community. Thank you.

22 MR. FRIEDMAN: Thank you for your
23 comments.

24 Next is Mike Rees.

19:21:36 25 MR. MIKE REES: Good evening. My name is
34

19:21:39 1 Mike Rees. R-E-E-S, no E on the end.

2 MR. FRIEDMAN: Mike, speak up, if you can.

3 MR. MIKE REES: Shall I pick one of these

Page 29

PM3-22 See our response to comment PM2-18.

PM3-23 As discussed in section 4.8.2.3, we believe the potential impacts on property values as a result of the proposed project would be minimal.

K-105

Public Meetings

3

K-106

		PM3 RN-110607-FERCpm.txt
	4	up?
	19:21:50 5	MR. FRIEDMAN: Yes. I don't think it
	6	works. Okay.
PM3-24	7	MR. MIKE REES: I'm a retired engineer
	8	from the Boeing Company and currently working
	9	as an independent engineering consultant. I
	19:21:58 10	did submit scoping comments to you on October
	11	the 15th, 2005. My understanding is that it is
	12	incumbent on the lead agency to address all the
	13	submitted scoping comments as part of the DEIS.
	14	This DEIS does not address many of my comments;
	19:22:18 15	therefore, I find it inadequate. I would ask
	16	that the lead agency review all the scoping
	17	comments that were submitted and make certain
	18	that those which have not been addressed in the
	19	DEIS be included in the FEIS.
PM3-25	19:22:35 20	I have three preliminary technical
	21	comments to add now. According to scientific
	22	reports, it is typical for an LNG system in the
	23	U.S. to have a 1.5 percent leakage rate. This
	24	leakage occurs primarily from valves, pumps,
	19:22:55 25	and mechanical systems used either to convert
		35
	19:22:57 1	the liquid to gas, to transport the gas along
	2	pipelines, or from spills and accidents.
	3	Further, natural gas is essentially
	4	methane, which is 24 times more potent
	19:23:10 5	greenhouse gas than carbon dioxide. The peak
	6	output from Bradwood Landing is 1.3 billion
	7	cubic feet per day. That would amount to
		Page 30

PM3-24 The draft EIS did address the general issues raised during scoping (see section 1.4, and table 1.4-2 in the draft EIS).

PM3-25 Section 4.10.1 has been updated to include the estimated GHG emissions resulting from the construction and operation of the project.

PM3-25 8 PM3 RN-110607-FERCpm.txt
 cont'd 9 approximately 20 million cubic feet of methane
 10 gas vented to the atmosphere per day somewhere
 11 in the system. That's equal to 31,000 tons of
 12 carbon dioxide a day.
 13 The environmental impact of expected
 14 leakage is not addressed in this DEIS. The
 15 FEIS should include the maximum expected
 16 leakage rate of the total system and the
 17 effects of the leakage on global warming.

PM3-26 17 Same comment is on vaporizing
 18 technologies. The DEIS indicates that no water
 19 would be taken from the Columbia River by
 19:23:58 20 vaporizing technologies. However, water
 21 condensate would be discharged into the river,
 22 which would be treated for PH neutralization
 23 and be at 68 degrees Fahrenheit. The amount of
 24 water that will be discharged is stated in the
 19:24:15 25 DEIS as 160 gallons per minute. That equates
 36

19:24:20 1 to a quarter of a million gallons a day.
 2 That amount of water would be
 3 discharged -- excuse me. The amount of water
 4 that would be discharged has not been addressed
 19:24:34 5 in the -- in the DEIS, and I would ask that the
 6 appropriate fish and wildlife agency address
 7 the effect of this discharge on local aquatic
 PM3-27 8 habitat. Also, I would like to ask that the PH
 9 neutralization system desired be explained to
 19:24:54 10 show how it is to prevent accidental discharge
 11 of non-neutralized water.

Public Meetings

3

PM3-26 As part of the section 7 consultation, which is described in detail in section 4.6.1, FERC has been involved in numerous conversations with the NMFS regarding the potential impacts of discharges on federally listed aquatic species. As part of these discussions, the NMFS provided comments related to the discharge of SCV water. Potential impacts on water quality and aquatic resources as a result of this discharge are discussed in sections 4.3.2.3 and 4.5.2.1, respectively, and will be described in detail in the revised BA and EFH Assessment.

The effectiveness of the pH neutralization tank, including sampling and analysis of the SCV discharge, would be addressed through the requirements of the NPDES permit. The ODEQ began the NPDES permit process on October 18, 2007.

PM3-27 The SCV discharge would be monitored in accordance with the NPDES permit to ensure that the treatment system is working properly. In addition, NorthernStar has indicated that the SCV discharge water would be monitored for temperature and pH in the control room through the DCS.

PM3-28

PM3 RN-110607-FERCpm.txt
My last comment is about the noise levels.

The noise analysis in the DEIS I believe is insufficient. As indicated in my scoping comments, it is not reasonable to identify noise levels only in the day/night level metric, the DNL metric. DNL is misleading. It does not address the impact of short duration noise amplitudes that are significantly higher than the average levels.

For example, if a large cannon were located at the Bradwood site and fired every 15 minutes, the effect of -- on the residents of Puget Island would be extremely annoying.

However, because the DNL metric averages the noise levels over 24 hours, the noise from the cannon would make an insignificant difference to the DNL average, and the DEIS only deals in DNL.

Therefore, the FEIS should also address the noise metric called time above. Time above is in which the total time above a certain noise level -- say, 60 dBA -- in a 24-hour period is reported in the number of minutes.

With a construction period of 36 months and the pile-driving program of four months, expressing the noise levels in DNL is totally inadequate. Communities would need realistic noise assessments.

MR. FRIEDMAN: Mike, can you wrap it up?

Page 32

Public Meetings

3

PM3-28

Short-term noise would be associated with construction activities at the site. Section 4.10.2.2 describes construction noise and estimates the noise associated with the short-term construction activity. The construction noise estimates are not provided in a day/night (L_{dn}) format but reflect the estimated noise associated with the operation of the equipment averaged over a short period. We are recommending a noise mitigation plan to minimize dredging noise impacts during construction of the facility. Operation of the facility would generally result in a fairly steady noise source and representation of the noise in a L_{dn} format is industry standard due the conservative 10 decibel addition of noise at night to compensate for the receptors additional sensitivity at night. As indicated in section 4.10.2.2, we recommend that NorthernStar make all reasonable efforts to ensure its predicted noise levels from the LNG terminal are not exceeded at the NSAs and file noise surveys with the Secretary no later than 60 days after placing the LNG terminal in service. We do not agree that permanent noise monitoring stations are necessary.

Public Meetings

3

K-109

PM3-28 16 PM3 RN-110607-FERCpm.txt
cont'd 17 MR. MIKE REES: I'll just wrap it up. Two
18 sentences.
19 Similarly, for the operational aspect of
20 it. If NorthernStar were truly interested in
19:26:41 21 measuring and minimizing the impact of the
22 adjacent communities, they would include at
23 least two noise monitors -- one at the Bradwood
24 site and one on Puget Island -- to evaluate
noise complaints that would surely occur.

19:26:55 25 Thank you for the opportunity for making
38

19:26:56 1 these comments.
2 MR. FRIEDMAN: Thank you.
3 Next is Mike Lewis. Mike, make sure you
4 speak loudly.
19:27:10 5 MR. MIKE LEWIS: Is this loud enough?
6 MR. FRIEDMAN: Yes.
7 MR. MIKE LEWIS: Okay. My name is Mike
8 Lewis, L-E-W-I-S. I'm a resident of Puget
9 Island. I represent myself and my family.

PM3-29 10 I have about 30 years of commercial risk
11 and insurance experience, and I'm going to
12 suggest to this audience that no matter what
13 you write down in any of these books and
14 studies, you're inviting yourself into a 9/11
19:27:34 15 incident. We saw a major city in the last ten
16 years attacked by terrorists using our
17 airplanes and attacking a well-built building
18 in a city that had lots of resources and lots
19 of political influence. And we have people

Page 33

PM3-29 Safety and security issues, including those related to terrorist attacks, are discussed in section 4.11. It is possible that a release from the LNG storage tanks could be caused by an intentional act, such as a terrorist attack. Although an intentional breach scenario could result in greater thermal radiation in the immediate vicinity of the release, such scenarios are typically associated with the desire to inflict damage to major infrastructure and population and commercial centers.

Public Meetings

3

K-110

PM3-29
cont'd

PM3 RN-110607-FERCpm.txt

19:27:51 20 dying today from that incident, and they will
21 continue to die from the asbestos exposure that
22 they endured.
23 This is just another example of how our
24 engineers in this country seem to be able to
19:28:06 25 put together just about anything. All you got
39

19:28:08 1 to do is look up the river and look at Hanford.
2 I worked with contractors at Hanford. They
3 approved everything as safe. What's leaking
4 potentially into the Columbia River?
19:28:19 5 Contaminated groundwater. Do we have a nuclear
6 storage facility yet in the United States? No.
7 So we've got this stuff stored all over the
8 place in defunct power plants.
9 So now we're going to do -- we're going to
19:28:35 10 invite a bomb into our community, a bomb that
11 is not necessary because it's all going to be
12 sold to California anyway. If California wants
13 it so bad, let them put it in. Their
14 lieutenant governor bragged about the fact that
19:28:48 15 we would get the site and they would get the
16 gas. That hardly seems to be a payoff. What
17 are we going to get off of this? Short-term
18 jobs? I doubt it. We won't even get that.
19 But we are inviting terrorists to put a
19:29:04 20 bull's eye on us. We're supplying the bomb in
21 the form of the gas tanks, and we're supplying
22 the foreign crews that cannot be vetted. We
23 can't even vet driver's licenses in this state;

3

K-111

PM3-29 19:29:19 25 PM3 RN-110607-FERCpm.txt
cont'd 19:29:19 25 And you talk about fires? Someone here
40

19:29:23 1 got a hundred-thousand-dollar grant to supply
2 firefighting gear for our firefighters on
3 Cathlamet Island -- or Puget Island. It's a
4 waste of time. Whenever there's a refinery
19:29:37 5 fire, they just stand back and contain it. You
6 don't fight fires in those kinds of things, and
7 you don't fight fires in ships like that. So
8 this is an unmitigated disaster being invited
9 into a community that does not deserve it.

19:29:50 10 Thank you.
11 (Applause.)
12 MR. FRIEDMAN: Thank you.
13 Next is Beverly Beal.
14 MS. BEVERLY BEAL: I'm Beverly Beal,
19:30:12 15 B-E-A-L. I'm a resident of Cathlamet. Thank
16 you for the opportunity to publicly express my
17 concerns with information contained within the
18 DEIS. A more detailed copy of my remarks will
19 be submitted in writing.

PM3-30 19:30:32 20 On page ES-2 under the heading "project
21 impacts and mitigation," your agency wrote the
22 final engineering design for the LNG terminal
23 would incorporate detailed seismic
24 specifications and other measures to mitigate
19:30:47 25 the impact of seismic hazards and may be
41

PM3-30 As discussed in section 4.1.4.3, welded steel pipelines are not prone to failure due to earthquakes unless they cross active faults or other areas subject to significant permanent ground displacement. Also see our responses to comments SA1-4 and LA7-25.

19:30:51 1 subject to final review and approval by the OEP
2 prior to construction.
3 Further references to seismic hazards
4 occurred on page ES-8, I-13, table 1.4-2, table
19:31:07 5 2.8.1-1, and so on. The point being, seismic
6 activity is a concern when siting LNG
7 terminals. In western Washington and Oregon,
8 seismic activity is well-known and not taken
9 lightly. Seismic-related hazards, beginning on
19:31:29 10 page 4-9 and going through page 4-13, includes
11 a list of recommendations that indicate a
12 heightened level of concern regarding the
13 location of the terminal. However, under
14 section 4.1.4.3, geological hazards, and on
19:31:48 15 page 4-22, seismic-related hazards, the same
16 regard is not given to the proposed pipeline.
17 I quote: "Given that the proposed
18 pipeline route does not cross any known active
19 faults, earthquakes and associated seismic
19:32:05 20 risks are not anticipated to have significant
21 impact on the proposed pipeline."
PM3-31 22 The Nesqually earthquake occurred February
23 28, 2001, is conspicuously missing from this
24 report. That particular earthquake caused
19:32:22 25 widespread damage from south of Portland to
42
19:32:25 1 Tacoma, Washington. Bridges and buildings were
2 damaged, including the dome of the Washington
3 state capitol building in Olympia, the area of
4 the greatest damage as well as near the
Page 36

PM3-31 The Nisqually earthquake has been added to section 4.1.3.3.

Public Meetings

3

K-113

PM3-31
cont'd

PM3 RN-110607-FERCpm.txt

19:32:36 5 epicenter, which registered 6.8 on the Richter
6 scale.
7 I was living in the Mill Creek area near
8 where the pipeline is proposed to come to
9 Cowlitz County. When the Nisqually earthquake
19:32:49 10 occurred, pictures were knocked off of walls,
11 books shaken out of cases, and dishes knocked
12 out of cabinets. My motor home shook like it
13 was sitting on a wave machine.
14 Yes, Mill Creek is a long way from
19:33:00 15 Olympia, but the Nisqually quake information
16 should have been taken into consideration and
17 included in the DEIS because it is a strong
18 piece of evidence to the vulnerability of this
19 area to seismic activity, including activity a
19:33:18 20 distance away. It is well reported that a
21 strong quake in the near future is predicted
22 for the area -- local vicinity.
23 The fact that while living in the Spokane,
24 Washington, area we joked about the big one
19:33:31 25 coming and eastern Washington becoming 43

19:33:33 1 shoreline property along the Pacific ocean is
2 no longer a joke, according to the
3 seismologists at the University of Washington.
4 It is rather shortsighted of NorthernStar and
19:33:45 5 the Federal Energy Regulatory Commission to not
6 have included this information and the
7 University of Washington studies.
8 Thank you.

K-114

PM3 RN-110607-FERCpm.txt

9 MR. FRIEDMAN: Thank you for your
19:33:54 10 comments.

11 Richard Erickson.

12 MR. RICHARD ERICKSON: Good evening.

13 Thank you. I'm Richard Erickson.

14 E-R-I-C-K-S-O-N. I'm the executive director
19:34:09 15 for the Lower Columbia Economic Development
16 Council. I'm here to duress -- address the
17 economic development impact.

PM3-32 18 Our county is suffering from the loss of
19 timber revenues, fishing revenues, and we're
19:34:24 20 losing a lot of family-wage jobs. Our largest
21 employer, Jerry DeBriac Logging, has gone from
22 130 jobs to a hundred in the last two years.
23 Our county has gone from 80 employees to a
24 hundred because they've had to assume our
19:34:39 25 clinic, which is struggling at best. Our
44

19:34:43 1 county commissioners are in the throes of
2 having to deal with tight budgets at the time.

PM3-33 3 My board of directors of 13 has taken a
4 wait-and-see attitude about Bradwood Landing
19:34:54 5 over the last two and a half years. In
6 discussing with the Bradwood officials and
7 looking at the safety record, my board of
8 directors has determined that we want to
9 support the Bradwood Landing project for
19:35:05 10 several reasons, jobs being number one. The
11 Bradwood officials have committed to place
12 three tug boats on our waterfront, which would
Page 38

PM3-32 Comment noted.

PM3-33 Comment noted.

Public Meetings

3

K-115

PM3-33
cont'd

PM3 RN-110607-FERCpm.txt

13 amount to 35 union-paid, high-wage, family-wage
14 jobs. In addition, there could be possibly ten
19:35:21 15 to 15 jobs in our county working at the plant.
16 With that possibility would make Bradwood
17 Landing our fourth-largest employer.
18 If you've never worked in the county where
19 you had to deal with your fourth-largest
19:35:36 20 employer, it is huge when you're dealing with
21 the type of jobs that we are looking for here
22 in our county.

PM3-34

23 The other thing that Bradwood Landing
24 brings to our county is an opportunity for our
19:35:46 25 high school kids to go to work during the
45

19:35:49 1 construction project and to be able to be
2 trained and come out three years later as a
3 journeyman. We have -- one of our largest
4 exports is our youth. They leave, go off to
19:35:59 5 college, and never return. We have an
6 opportunity for our high school kids, through
7 the work force program, through Lower Columbia
8 College and the work force in Clatsop County,
9 to be able to be employed and then come out
19:36:10 10 with an education.

PM3-35

11 In addition, the Bradwood Landing
12 officials have made several commitments to
13 Wahkiakum County. Because we are not going to
14 receive the tax revenue that Clatsop County has
19:36:25 15 of possibly \$8 million, they have made a
16 commitment to us of \$100,000 a year until the
Page 39

PM3-34 Comment noted.

PM3-35 Comment noted.

Public Meetings

3

K-116

PM3-35 |
cont'd |

PM3 RN-110607-FERCpm.txt

17 plant is sited and then \$500,000 a year as long
18 as the plant is operating. They have come
19 through on the first two checks. They have
19:36:40 20 made several commitments to our county, and
21 they have fulfilled those commitments.
22 Consequently, we feel that the officials
23 of Bradwood Landing and NorthernStar have
24 fulfilled their commitments to us, and we feel
19:36:53 25 that the jobs are necessary and the education
46

19:36:56 1 to our children would be important to our
2 operations. So the board of directors of the
3 Lower Columbia Economic Development Council
4 supports the siting of Bradwood Landing for the
19:37:06 5 economic development opportunities. Thank you.
6 MR. FRIEDMAN: Thank you.
7 (Applause.)
8 MR. FRIEDMAN: Next is Kathleen
9 Gilbertsen.
19:37:23 10 MS. KAYRENE GILBERTSEN: Good evening.
11 Kayrene Gilbertsen. K-A-Y-R-E-N-E,
12 G-I-L-B-E-R-T-S-E-N.
13 MR. FRIEDMAN: Thank you for correcting
14 me. Speak a little louder.
19:37:35 15 MS. KAYRENE GILBERTSEN: I will. I live
16 on Puget Island. I am a native of Puget
17 Island. I own property within view of Bradwood
18 Landing.
PM3-36 | 19 I would like to say that I have followed
19:37:45 20 what NorthernStar has done and has said they
Page 40

PM3-36 Comment noted.

Public Meetings

3

K-117

PM3-36
cont'd

PM3 RN-110607-FERCpm.txt

21 would do. They have come up -- they have
22 followed through with their promises to our
23 community. I have followed the information
24 that we've received in the newspapers regarding
19:38:00 25 other plants. I have read what firemen have
47

19:38:04 1 said who have gone to Savannah, come back, and
2 said we can -- we can deal with this.
3 As far as fear, nobody wants something in
4 your own backyard. You'd always like it to be
19:38:16 5 in someone else's. So that tells me that
6 perhaps we're not so opposed to liquid natural
7 gas; we're just opposed to having it in our
8 neighborhood. Let's send it to California.
9 The fact that there is a plant in Boston,
19:38:34 10 in Savannah, and an LNG plant docking every 18
11 hours in Tokyo makes me feel pretty safe about
12 the future of Bradwood Landing, and I think we
13 have more to fear by riding the ocean of fear.
14 Thank you very much.
19:38:54 15 MR. FRIEDMAN: Thank you.
16 (Applause.)
17 MR. FRIEDMAN: You know, let's not applaud
18 or cheer. Let's be neutral. Thanks. Show
19 everyone the same respect. I appreciate that.
19:39:02 20 Gary Gilbertsen.
21 MR. GARY GILBERTSEN: Gary Gilbertsen from
22 Puget Island. I'm a retired commercial
PM3-37 23 fisherman and school teacher. The LNG
24 terminals in this country and worldwide have an
Page 41

PM3-37 Comment noted.

Public Meetings

3

K-118

PM3 RN-110607-FERCpm.txt

PM3-37 19:39:24 25 excellent safety record. The pipeline comes
cont'd 48

19:39:29 1 from Canada going south, goes through Cowlitz
2 County with lines that go under city streets,
3 providing gas for homes and businesses. There
4 is a line that goes from port westward to PG &
19:39:46 5 E's gas-fired plant, and all of these have had
6 good safety records. There's been no accidents
7 within my memory.

PM3-38 8 As far as the environment, this river has
9 been industrialized since the 19th century, and
19:40:09 10 although the fish runs are down from their
11 previous past numbers, they have been stable
12 for a number of years. There is wildlife that
13 doesn't seem to be affected by places like the
14 pulp mill like the old Wauna mill site or other
19:40:29 15 industries. We have ospreys that we didn't
16 have when I was a child, bald eagles, and
17 numerous other birds and wildlife, white-tailed
18 deer, variety.

19 So seems to me that -- that there isn't a
19:40:53 20 problem with building a plant at Bradwood
21 Landing, a former mill site. Thank you.
22 MR. FRIEDMAN: Thank you for your
23 comments.
24 Richard Beck.

19:41:11 25 MR. RICHARD BECK: I've got some
49

PM3-38 Comment noted.

Public Meetings

3

K-119

19:41:12 1 PM3 RN-110607-FERCpm.txt
supporting documents and stuff.
2 MR. FRIEDMAN: You can give them to me,
3 and I'll put it in the record.
4 MR. RICHARD BECK: Okay.
19:41:21 5 MR. FRIEDMAN: Thank you.
6 MR. RICHARD BECK: My name is Richard
7 Beck, and I live on Puget Island with my
8 family.
9 MR. FRIEDMAN: Richard, spell your last
19:41:36 10 name for the court reporter.

PM3-39

11 MR. RICHARD BECK: B-E-C-K.
12 On Saturday, January 30th, 1965, at 1:20
13 in the morning, after weeks of heavy rain, the
14 cliff near Bugby Hole gave way and crashed into
19:41:47 15 the Columbia River. A huge wave was generated,
16 which surged across and washed over a section
17 of the Puget Island dike, killing Haakon
18 Gabrielsen, age 59, as it destroyed his house.
19 Other homes were damaged, including those of
19:42:01 20 Fred Aegerter and Tom Irving. Extensive damage
21 was done to the dikes, sloughs, and crops
22 planted nearby.
23 Representatives from the Army Corps of
24 Engineers, Representative Jody Butler Hansen,
19:42:10 25 and other state and county agencies met to
50

19:42:13 1 assess the area's needs. All of this, along
2 with pictures showing the slides and damages,
3 were reported on the front page of Wakiakum
4 Eagle on February 4th, 1965.

PM3-39 Information regarding the 1965 landslide has been added to section 4.1.3.3.

Public Meetings

3

K-120

PM3-39 19:42:23 5 PM3 RN-110607-FERCpm.txt
cont'd 6 Many concerned local residents, myself
7 included, have previously testified regarding
8 this event, which happened only a few hundred
9 yards from the Bradwood Landing liquified
10 natural gas terminal. It appears, although I
11 cannot find a clear diagram of the proposal,
12 that the plan is to drill horizontally and run
13 their pipeline right through the base of that
14 very cliff.
15 What was FERC's response to our testimony?
16 Quoting from page 4-9 of the DEIS: We received
17 comments about a landslide that reportedly
18 occurred in 1965 upriver of and adjacent to the
19 Bradwood Landing site. We were unable to find
20 information regarding such a landslide
21 occurring in 1965. In addition, a review of
22 aerial photographs from various intervals
23 dating back to 1948 did not reveal any
24 indications of landslides occurring within a
25 one-mile radius of the site.
19:43:07 25 So what was their problem? All someone
51

19:43:09 1 had to do was walk into the local paper of
2 record and ask publisher Eric Nelson, whose
3 father probably wrote the original story and
4 took those pictures, if he had anything on a
5 slide in 1965 and they would have got what I
6 got in five minutes. Furthermore, the exposed
7 cliff is still visible, and anyone with an
8 elementary knowledge of geology can see that a

Public Meetings

3

K-121

PM3-39
cont'd

9 PM3 RN-110607-FERCpm.txt
slide has occurred there fairly recently.

19:43:29 10 If you've lived here for more than two
11 years, you know a basalt rockslide ends up
12 blocking SR4 every couple of years, taking
13 days, months, and sometimes even years to
14 clear, and it is impossible to prevent them
19:43:42 15 from happening.
16 Maybe that's it. No one from NorthernStar
17 or FERC is shown much interest in what it's
18 like to live around here -- the fishing, the
19 weather, the wildlife. Does this result in an
19:43:51 20 inability to really care what this terminal and
21 pipeline and all these tankers might really do
22 to us? Or is there maybe an agenda which is so
23 focused on seeing a permit awarded to knowingly
24 suppress any inconvenient evidence? Why has
19:44:04 25 Puget Island been left out of the background in
52

19:44:06 1 so many renderings of the facility? Just
2 ignore the potential problems until you get
3 your deal done?
4 My opinion has been all along that if a
19:44:13 5 regulatory agency really cared about the damage
6 from a magnitude-nine earthquake, huge floods
7 washing out the 500-foot-high ridge separating
8 Bradwood from the mighty Columbia, basalt
9 cliffs crashing into the river generating huge
19:44:24 10 waves, maybe even all this happening at once,
11 they wouldn't allow a terminal and a pipeline
12 to be sited there in the first place.

Public Meetings

3

K-122

PM3 RN-110607-FERCpm.txt
13 The Greeks had a concept called hubris,
14 which is just a cockiness which makes you
19:44:36 15 believe you can handle anything which might
16 come along. It was forever causing guys to end
17 up poking out their own eyes, or the gods
18 punishing them by having their liver eaten by
19 vultures for all eternity. The point was that
19:44:45 20 when you're playing with powerful forces, you
21 should have a little humility. Nobody really
22 knows how to prepare an LNG terminal for a
23 Cascadia Subduction Zone earthquake because
24 there hasn't been one in 300 years. But we're
19:44:56 25 due for one now. Don't you do something the
53

19:45:00 1 rest of us will all regret. Thank you.
2 MR. FRIEDMAN: Thank you for your
3 comments.
4 Craig Brown.
19:45:11 5 MR. CRAIG BROWN: I'm not going to bother
6 with this because I don't believe it's working
7 anyway. My name is Craig, C-R-A-I-G, Brown,
8 just like the color. I do not own property
9 along the pipeline. I'm speaking as an
19:45:22 10 individual. I'm glad Mr. Lewis made the
11 remarks that he made. It's a good opening for
12 me.

PM3-40 13 I can't imagine what jobs would be
14 worth -- would trump public safety. Public
19:45:34 15 safety seems to be the most critical issue of
16 all concerning this site and those ships coming

Page 46

PM3-40 To make the Columbia River suitable for the type and frequency of LNG marine traffic associated with the Bradwood Landing Project, additional measures as described in the WSR will be necessary to responsibly manage the navigation, safety, and security risks.

PM3-40 17 PM3 RN-110607-FERCpm.txt
 cont'd 18 up the river. This is not like Boston Harbor
 19 out here. That's a narrow a channel out there.
 19:45:48 20 It is so narrow in many places that you, with a
 21 good arm, could throw a rock and hit a ship as
 22 it passes by. This is very different from
 Boston Harbor.

PM3-41 23 There are issues in the draft EIS that
 24 concern mitigation of fire hazards because we
 19:45:59 25 have to consider the possibility of a rupture
 54

19:46:02 1 or a leak. It can happen. Whether
 2 intentionally or accidentally, it can happen.
 3 The draft EIS suggests that it can be mitigated
 4 with tugboats with firefighting equipment on
 19:46:15 5 them.

6 I retired from the San Francisco Fire
 7 Department. I've had extensive training with
 8 the state fire marshal's office, but I was
 9 never allowed to serve on the fire boats
 19:46:25 10 because the specialized training that goes into
 11 the officers and firefighting crews on those
 12 ships is so specialized that if you haven't got
 13 the qualifications, you don't get to be
 14 assigned there. Fighting marine fires is
 19:46:38 15 highly specialized.

16 Crews on tugboats, regardless of the
 17 equipment that they may have around them, are
 18 not going to be able to deal with this kind of
 19 a situation. And besides that, the ships
 19:46:49 20 cannot get into -- the tugboats cannot get into

Public Meetings

3

PM3-41 In-transit firefighting has been identified as a resource gap in the WSR. A plan for managing firefighting, including response procedures, resources, and requirements must be developed and approved.

Public Meetings

3

PM3-41
cont'd

PM3 RN-110607-FERCpm.txt

21 position in order to mitigate -- that is, to

22 put up a fire screen -- if they cannot position

23 around the ships. When you have a narrow

24 channel, the tugboat is either going to precede

19:47:01 25 or follow the big ships in those narrow areas.

55

PM3-42

19:47:04 1 And then there's that problem with the

2 marine layer. We have a marine layer that

3 comes down this river quite a bit. In fact, we

4 had it this morning, if you remember. When

19:47:14 5 that vapor cloud from a leak comes across that

6 cold river, with all the experience and all the

7 equipment in the world, you will not be able to

8 see the vapor cloud; not until it gets over

9 land, not until it begins to warm and return to

19:47:28 10 methane its ambient natural state will you

11 finally find it getting through an ignition

12 source. Then you'll see the vapor cloud

13 because then the flammability will read right

14 back to the source.

19:47:40 15 We have to be realistic about what can be

16 mitigated. The draft EIS does not deal

17 realistically with how we can mitigate fire

18 hazards from that facility or a rupture of a

19 tank along the passage of the river.

19:47:53 20 Thank you.

21 MR. FRIEDMAN: Thank you.

22 Karen Berteach.

23 MS. KAREN BERTROCH: My name is Karen --

24 is this one working? Or is this one working?

Page 48

K-124

Public Meetings

3

K-125

19:48:10 25 PM3 RN-110607-FERCpm.txt
MR. FRIEDMAN: Yes, the first one was.
56

19:48:11 1 MS. KAREN BERTROCH: Hello. My name is
2 Karen Bertroch, B-E-R-T-R-O-C-H.
3 MR. FRIEDMAN: Thank you for correcting.

4 MS. KAREN BERTROCH: That's fine. I come
19:48:19 5 representing myself, no entity other than being

PM3-43

6 a landowner in Grays River. Grays River is a
7 highly terroir fish with the Lower Columbia
8 Fish Recovery Board because we carry several
9 species of endangered fish. We have a huge
19:48:32 10 flooding issue out there, and we have a very
11 hard time finding funding.

12 I am excited that if the permit goes
13 through, there is additional money available
14 for fish habitat restoration that is not
19:48:43 15 required by mitigation. There is an additional
16 big fund that has been given to the Fish
17 Recovery Board that will be used strictly for
18 fish habitat restoration and monitored, given
19 out, and taken care of by the Fish Recovery

19:48:56 20 Board. The Fish Recovery Board is highly
21 respected, assigned by the State, and we're
22 excited to have that funding available.

PM3-44

23 I am also pleased that the
24 NorthernStar/Bradwood Landing folks have
19:49:08 25 already given significant funding to the area.
57

19:49:12 1 30,000 went to Puget Island last year, 30,000
Page 49

PM3 RN-110607-FERCpm.txt

2 to the Cathlamet fire department, and this year
3 they have authorized already \$37,000 for a much
4 needed radio study for the Sheriff's Department
19:49:24 5 that the County absolutely does not have the
6 funding to meet. Many of our areas do not have
7 radio coverage for our volunteer firemen. This
8 is an exceptionally important study.

PM3-45

9 In my experience, I have seen here in this
19:49:36 10 county a great deal of fear, a great deal of
11 raising of red flags, but I come from a place
12 where, in Alaska, we fought the pipeline tooth
13 and nail. And I'll tell you, it didn't hurt a
14 thing really. The caribou understood it, and
19:49:55 15 the decision is going to have to be made to
16 rebuild it or not, but we fought that pipeline.
17 And I learned a hard lesson: That if we
18 compromise with nature, we can all win.
19 Thank you.
19:50:04 20 MR. FRIEDMAN: Thank you for your
21 comments. Paul Vik.
22 MR. PAUL VIK: I'm going to pass.
23 MR. FRIEDMAN: All right. Before we go on
24 -- Robert Kiser, are you here? Robert, did you
19:50:17 25 speak at any of the earlier meetings?
58

19:50:19 1 MR. ROBERT KISER: No, I did not.
2 MR. FRIEDMAN: All right. Please come up.
3 It's your turn.
4 MR. ROBERT KISER: I hope you didn't get
19:50:31 5 me mixed up with my wife.
Page 50

Public Meetings

3

K-127

PM3 RN-110607-FERCpm.txt

6 Robert Kiser, K-I-S-E-R; landowner on the
7 pipeline, supposedly. I don't know for sure
8 where the pipeline's going to be, but it
9 potentially can impact me about seven and a
19:50:49 10 half acres of temporary right-of-way and close
11 to three and a half acres of primary
12 right-of-way if it's located where I think it's
13 going to be.

14 I will be providing you with written
19:51:05 15 testimony by December 24th. You'll have to
16 shut me off at probably three minutes because
17 I'm going down through page and paragraph in
18 the DEIS where I have found problems.

PM3-46

19 Page ES-5, you state that the technical
19:51:27 20 review identified several areas of concern with
21 respect to the proposed facility, and we
22 identified specific recommendations be
23 addressed by NorthernStar prior to site
24 preparation. I cannot understand why that is
19:51:46 25 not a requirement in the DEIS. If we are going
59

19:51:50 1 to provide input related to this DEIS and the
2 decisions that are being made, then we need to
3 have that opportunity up front, not before
4 construction, not before some other EIS or
19:52:06 5 whatever. We will not have that opportunity
6 after this presentation.

7 Page ES-4, first paragraph, you state
8 National Marine Fishery Service and Fish and
9 Wildlife Service has some questions --
Page 51

PM3-46

See our response to comment PM1-2. We have recommended that no construction be allowed until after we have revised our BA, formally consulted with the FWS and NMFS, and completed compliance with the ESA.

PM3 RN-110607-FERCpm.txt

PM3-46 19:52:21 10 additional information that means you will be
cont'd 11 revising your EHA assessment and BA. Your
12 revision needs to be part of the DEIS so that
13 the public can respond intelligently to the
14 impacts of the T and E species.

PM3-47 19:52:38 15 Page ES-7, you state that the U.S. Coast
16 Guard will issue an LOR finding including
17 recommendations that may, may, include
18 conditions. Here again it leaves it up to the
19 NorthernStar discretion to implement all the
19:52:53 20 U.S. Coast Guard identified safety conditions.
21 It should be a requirement of the DEIS. How
22 can you adequately evaluate -- evaluate
23 navigational and community safety without it?

PM3-48 24 Page ES-8, how can you conclude that the
19:53:11 25 construction and operation of Bradwood Landing
60
19:53:13 1 project has a potential for limited significant
2 environmental impacts when the National Marine
3 Fishery Service and Fish and Wildlife Service
4 are still requesting additional information and
19:53:26 5 haven't identified the impact on federally
6 listed species?

PM3-49 7 Page 1-25, I specifically mentioned at a
8 scoping meeting, along with others, the
9 unstable sales along the proposed pipeline
19:53:41 10 route. Nothing is mentioned here.

PM3-50 11 Page 1-3, purpose and need. How can you
12 deliver natural gas to Williams Northwest
13 interstate pipeline system when it is fully
Page 52

Public Meetings

3

PM3-47 Conditions of the Coast Guard LOR and the FERC certificate would not be discretionary – they would be requirements.

PM3-48 We believe that implementation of the FERC staff's Plan and Procedures, our recommendations, and NorthernStar's ESC Plans and SWPPP would result in the project having limited significant environmental impacts. As stated in section 4.6.3, the FERC would not allow construction to begin if either the FWS's or NMFS's BO finds that the project would result in the destruction or adverse modification of designated critical habitat.

PM3-49 Information regarding the landslide that occurred in 1965 approximately one-half mile from the proposed LNG terminal site has been added to section 4.1.3.3. The geologic conditions at this location are not the same as at the LNG terminal location.

PM3-50 See our response to comment PM1-10.

PM3 RN-110607-FERCpm.txt

14 subscribed?
 PM3-51 19:53:56 15 Page 1-6, permits approval and regulatory
 16 requirements. FERC is also required to follow
 17 the NEPA process. NEPA is excluded from
 18 statements regarding regulatory requirements
 19 for you.

PM3-52 19:54:12 20 Page 2-122.1.215, the discussions
 21 concerning 1500 recreational fishing boats used
 22 in the Columbia River in a year. It is a very
 23 poor way of determining use. Besides the
 24 number being low, the use needs to be expressed
 19:54:32 25 in user base to determine accurate description
 61

19:54:36 1 of total use. Charter boats, for example, can
 2 be on the Columbia for eight hours a day. It
 3 is not uncommon for recreational fishing boats
 4 to spend five hours a day on the river. In
 19:54:46 5 addition, a person who fishes the Columbia
 6 usually takes more than one trip per year. For
 7 example, I took 17.

8 MR. FRIEDMAN: Okay. Can I ask you to
 9 wrap it up?

19:54:57 10 MR. ROBERT KISER: Wrap up?

11 MR. FRIEDMAN: Yep.

12 MR. ROBERT KISER: Going to hear the rest
 13 of it tomorrow night.

14 MR. FRIEDMAN: That's fine. And you're
 19:55:03 15 going to send in detailed written comments.

16 MR. ROBERT KISER: Which one do I pick? I
 17 might as well keep going.
 Page 53

Public Meetings

3

PM3-51 The FERC is meeting its NEPA obligations through this EIS process.

PM3-52 Section 4.8.1.7 has been revised to correct the number of recreational fishing boats.

Public Meetings

3

K-130

PM3 RN-110607-FERCpm.txt

PM3-53 18 Survey and staking. It is unclear if
19 survey and staking occurs before clearing
19:55:16 20 operation begins or before construction of
21 trench. Property surveys and wood (inaudible)
22 need to be marked and protected throughout all
23 phases of construction. All phases of
24 construction must operate within the
19:55:27 25 right-of-way or with approval of landowner.
62

19:55:30 1 This should include all equipment, including
2 egress and ingress, over approved access road.
3 Thank you.
4 MR. FRIEDMAN: Thank you for your
19:55:38 5 comments. We'll address those comments in the
6 FEIS.
7 Now we've reached the part where the only
8 people who have signed up are people who have
9 already spoken. So I want to ask, is there
19:55:51 10 anyone in the room who has not spoken yet, who
11 did not speak at a previous meeting, who wants
12 to speak?
13 I didn't see any hands go up, so I'm going
14 to call Gayle Kiser up.
19:56:09 15 Gayle, did you ask me for a hard copy of
16 the DEIS?
17 MS. GAYLE KISER: No. I have a hard copy
18 of the DEIS.
19 I'll try to speak specifically -- oh,
19:56:20 20 excuse me. Gayle Kiser. That's K-I-S-E-R.
21 Pipeline landowner. I'll speak specifically
Page 54

PM3-53 Our discussion of general pipeline construction techniques is included in section 2.4.2.1. In addition, we have recommended in section 5.2 that NorthernStar employ at least one EI per spread during construction of the proposed project to ensure equipment remains inside the approved construction work area, including access roads.

		PM3 RN-110607-FERCpm.txt	
PM3-54	22	tonight. Last night I spoke generally.	
	23	Addressing Section 3.1, FERC alternatives,	
	24	nowhere in the evaluation criteria is the	
	19:56:38 25	effect on human population taken into	63
PM3-55	19:56:41 1	consideration. The question: Can we do it?	
	2	Yes. Should we do it? No.	
	3	Section 3.1.1, the no-action alternative.	
	4	Where is the data to support claims of expanded	
	19:56:54 5	need for natural gas? The sources cited are	
	6	not independent but industry-related. How can	
	7	a claim be made that LNG will lower prices?	
	8	Where is the economic study to support this	
	9	assertion?	
PM3-56	19:57:06 10	Section 3.1.1.2, increased efficiency in	
	11	conservation. Energy conservation should be	
	12	encouraged. A study by the Natural Resources	
	13	Defense Council recently showed that we could	
	14	reduce our use of natural gas by 12 percent	
	19:57:22 15	merely by using today's technology. Why state	
	16	that the United States' production is declining	
	17	when there are plans under way to build a new	
	18	pipeline from the Rockies to the Northwest?	
PM3-57	19	Section 3.1.8.1, major pipeline route	
	19:57:37 20	alternatives. Too much weight is being given	
	21	to the project objective, getting gas from	
	22	Bradwood Landing to potential markets. Without	
	23	an independent needs assessment, this is a	
	24	subjective opinion. The Palomar pipeline must	
	19:57:50 25	be included in this assessment. Where is the	

Public Meetings

3

- PM3-54 The alternatives analysis did address impacts on the human population by considering such factors as population density and visual impacts. A more detail discussion of the project's potential impacts on regional population may be found in sections 4.7 and 4.8 of the final EIS.
- PM3-55 Section 3.1.1 of the final EIS has been modified to briefly address the need for natural gas. A more detailed discussion of project need can be found in section 1.1. There are multiple independent studies cited in this EIS that suggest that bringing in additional new supplies of natural gas to the region in the future will help to stabilize prices.
- PM3-56 Section 3.1.1.2 describes why we believe increased conservation does not provide an alternative to the proposed project, but rather a complementary component of the overall energy demand and supply mix. As explained in section 1.1, estimates from the EIA indicate that domestic natural gas production from conventional onshore sources will decline in the future, while there would be increased production from unconventional sources, such as coalbed methane produced in the Rocky Mountains. Section 3.1.2.2 discusses newly proposed jurisdictional interstate pipelines that could transport Rocky Mountain gas to the West Coast as system alternatives to the Bradwood Landing Project.
- PM3-57 As explained in the beginning of section 3.1, the project objective is key to the alternatives assessment because an alternative must be able to meet the project's objective. The Palomar pipeline is discussed as a system alternative in section 3.1.2.2 (see our response to comment PM1-24). There is a brief summary of the need for this project in section 1.1 of the EIS. However, the Commission will make its independent assessment of need in the project Order.

PM3-58 19:57:53 1 data to support the assertion that an HDD bore
2 of the Columbia River at Bradwood is
3 unconstructable?

PM3-59 4 Table 3.1.8-2 discusses the alternative
19:58:05 5 route from entry pit of the HDD bore hole that
6 would cross the Cowlitz River. I am intimately
7 acquainted with this property, and I can tell
8 you there are no oak trees that would be
9 disturbed. The alternative will take out our
19:58:19 10 pear trees. The power line right-of-way that
11 is mentioned is now abandoned, and access is
12 under control of the landowner.

PM3-60 13 Section 4.1.4.1, stratigraphy. Landslide
14 areas have not been adequately identified. The
19:58:33 15 pipeline is proposed to cross an ancient debris
16 area on our property that was deemed too

PM3-61 17 unstable for housing construction. The Cowlitz
18 River crossing will involve the Ostrander
19 protection zone that the Burlington Northern
19:58:46 20 had to drive pilings more than 100 feet deep to
21 reach solid rock.

PM3-62 22 The nearby K8 pipeline crosses the north
23 end of our property. Neighbors had to move
24 their house because of a land movement caused
19:58:58 25 by the installation of that pipeline, and it is
65

19:59:00 1 under monitor now and was last moved in April

Public Meetings

3

PM3-58 NorthernStar did not consider an HDD directly from its proposed Bradwood Landing LNG terminal to Wahkiakum County, Washington because of the width of the Columbia River at that location. A crossing at the terminal would place the pipeline at the town of Cathlamet, and a pipeline route east from there to an interconnection with the existing Williams Northwest system near Kello would have to traverse extremely rough, hilly terrain.

PM3-59 The FERC prefers a route for a new pipeline that follows an existing right-of-way, such as the abandoned power line corridor to be utilized by Route Variation NS-8 in the vicinity of MP 33.9. NorthernStar has committed to working with landowners to preserve mature trees (see section 4.7.1.15). The specifics of adjusting the pipeline alignment to avoid mature trees would be negotiated through easement agreements. The text in the EIS has been revised to indicate that the power line right-of-way is now abandoned.

PM3-60 We have recommended in section 4.1.4.3 that NorthernStar conduct additional field mapping and subsurface investigations as needed to develop a Final Pipeline Design Geotechnical Report. Unstable areas that have not yet been identified would be identified at that time and design measures would be required to mitigate potential damage due to unstable slopes.

PM3-61 Due to the ductile nature and buoyancy of pipelines, pilings are not required for structural support as they are with other structures such as railroads and buildings.

PM3-62 See our response to comment PM3-60.

PM3-63 2 PM3 RN-110607-FERCpm.txt
and May of this year.

3 Page 4.22 -- excuse me -- 4-22. seismic
4 related hazards, quote: "The proposed pipeline
19:59:14 5 would cross a seismic hazard area between
6 milepost 34 and 35." Again, I'm intimately
7 acquainted with that area. This area is likely
8 delineated as a seismic hazard area based on
9 the potential for liquefaction of the soils
19:59:28 10 within the flood plain. It changes every year.
11 The high water comes and goes, and that section
12 of the river changes every year.

PM3-64 13 quote: "In recent history, no accounts of
14 damage to any existing pipelines have been
19:59:44 15 documented in the project area." And we just
16 heard previous testimony about how safe these
17 lines are.
18 Someone is not taking into account the two
19 explosions at the Williams pipeline within the
19:59:57 20 last 12 years, one in Castle Rock, one in
21 Kalama, both due to land movement. I know
22 about them. I watched both of them from my
23 house. Last winter the Williams pipeline fell
24 into the Toutle River. No accounts of damage?
20:00:12 25 I beg to differ.

66

20:00:15 1 MR. FRIEDMAN: Thank you for your
2 comments.
3 Next is Daniel Serres.
4 MR. DANIEL SERRES: Last name is spelled
20:00:40 5 S-E-R-R-E-S.

Public Meetings

3

PM3-63 Changes in the river level between MPs 35 and 35 would not affect the pipeline.

PM3-64 See our response to comment PM2-16.

PM3-65 6 PM3 RN-110607-FERCpm.txt
 7 I want to begin by saying that you pointed
 8 out at both meetings, Mr. Friedman, that FERC
 9 is not a sponsor of the project. While that
 10 may be true, we have to wonder about Natural
 20:00:51 11 Resource Group a little bit because they are
 12 also doing review for the Palomar pipeline.
 13 They're not working for FERC; they're working
 14 for Palomar pipeline. Because these two
 15 pipelines being so closely related, you have to
 20:01:05 16 question if there is not a conflict of interest
 17 from Natural Resource Group in participating in
 18 both projects, one as the agency-regulated
 19 project and the other as agency -- or as a
 20:01:17 20 proponent of the project itself. I just wanted
 to point out that problem.

PM3-66 21 I want to echo everything that's been said
 22 about public safety, the limited response
 23 capabilities. Sections 4.8.2.6 and 4.8.3.6,
 24 the findings regarding public safety.
 20:01:33 25 Basically the resources available to safeguard
 67

20:01:37 1 the public along the pipeline and along the
 2 terminal are totally inadequate. The problem
 3 is you failed to disclose the potential and
 4 reasonable and foreseeable incidence that
 20:01:47 5 happen along the pipeline, like Gayle talked
 6 about having seen two of them from her house.

PM3-67 7 And in doing that, you also failed to
 8 assess what can be responded. There's sort of
 9 a laundry list in there, fire department here,

Public Meetings

3

PM3-65 The FERC has determined that Natural Resource Group, LLC (NRG) does not have an Organizational Conflict of Interest (OCI) by working on both the Bradwood Landing Project and the Palomar Project. When the issue of an appearance of OCI was raised, the FERC required that NRG separate staff and offices between the projects. The letters to and from the FERC and NRG on this subject are a matter of record, and have been placed in the public file for this proceeding.

PM3-66 See our responses to comments PM2-16 and PM3-8.

PM3-67 See our response to comment PM1-1.

Public Meetings

3

K-135

PM3-67
cont'd

PM3 RN-110607-FERCpm.txt

20:02:00 10 fire department there, and there's nowhere that
11 provides a reasonable narrative that describes
12 how the public is supposed to be protected, how
13 the public will respond, and again, mitigation
14 of public safety impacts, mitigation required,
20:02:12 15 to be likely to meet the community standard for
16 mitigation, for being included in the DEIS.
17 The Coast Guard has identified -- and I
18 quote from 4.8.2.6 -- significant gaps exist in
19 firefighting capability for both shore and
20:02:26 20 waterside firefighting response. The same is
21 true on the pipeline. So FERC is not
22 disclosing the real impacts both in costs and
23 increased risks in this NEPA document. That's
24 a failure to comply with NEPA.

PM3-68

20:02:40 25 I'd also point out that the salmon 68

20:02:43 1 enhancement initiative -- I want to switch to
2 fish issues now. The SEI is too vague to be
3 measured with a guaranteed real value to salmon
4 at this point. What we do know is that
20:02:56 5 NorthernStar is essentially proposing to create
6 essentially a blender in the middle of the
7 Columbia River, both in construction and in
8 continued operation, to have tugs operating in
9 the Columbia River with their powerful
20:03:06 10 thrusters, having a vessel turning in that
11 area, ongoing maintenance dredging.
12 The compensatory mitigation measures are
13 not adequately described in section 4.6.2.2.

PM3-68 The SEI is discussed in the response to comment FA4-12.

While every effort would be made to avoid or minimize aquatic resource impacts resulting from construction and operation of the proposed LNG terminal, some unavoidable impacts would occur (see section 4.5.2.1). These unavoidable impacts would be compensated for through implementation of NorthernStar's Compensatory Mitigation Plan. As described in section 2.1.5, NorthernStar is currently revising its Compensatory Mitigation Plan. The revised plan will be submitted to the NMFS and FWS as part of the FERC's BA and EFH Assessment. The FERC would not allow construction to begin until after we have concluded formal consultation with the FWS and NMFS.

Public Meetings

3

PM3-68
cont'd

PM3 RN-110607-FERCpm.txt

14 The table that goes through the impacts to
20:03:19 15 salmon repeatedly states, unavoidable impacts
16 will be mitigated to implementation of
17 NorthernStar's mitigation plan.
18 While that sounds fine, but that fails to
19 lay out again a narrative of how impacts that
20:03:34 20 are very serious and very likely to disturb
21 salmon habitat used for rearing and migration
22 through both -- basically at the head of the
23 channel, how those impacts would be mitigated
24 in place, in kind, and in time. And it's very
20:03:50 25 important that we realize the extreme

69

20:03:53 1 significance of this area of the river, with 13
2 listed fish species passing through this very
3 point in the river. It's an incredibly
4 important chill point. An estuary that is now
20:04:05 5 widely recognized to be --
6 MR. FRIEDMAN: Let's wrap it up.
7 MR. DANIEL SERRES: -- the linchpin to
8 recovery in the estuary.
9 So to conclude, I will say the DEIS fails
20:04:14 10 to comply with NEPA in disclosing impacts to
11 both safety, public service, to threatened
12 salmon species. Impacts to public safety and
13 fisheries are both more significant than their
14 characterization in the DEIS and to the impacts
20:04:24 15 like the 50 acres in the middle of salmon
16 habitat are unmitigable. Thank you.
17 MR. FRIEDMAN: Thank you for your

Public Meetings

3

PM3 RN-110607-FERCpm.txt
 18 comments. We're going to address most of what
 19 you had to say in the FEIS. There is one
 20:04:34 20 comment you said at the beginning that I want
 21 to address right now. You can sit down,
 22 Daniel.
 23 Daniel raised the issue that we just found
 24 out about that NRG is working for the FERC as
 20:04:45 25 our third-party environmental contractor on the
 70

20:04:49 1 Bradwood Landing project. They've served this
 2 role for almost three years. Over two years.
 3 Palomar is a brand-new project, just was
 4 authorized for the initial prefilling process
 20:05:09 5 only recently, and so we've only recently
 6 discovered that NRG is working for Palomar as
 7 its private consultant. We wrote -- "we,"
 8 meaning the FERC -- has written a letter to NRG
 9 questioning this apparent conflict of interest
 20:05:26 10 and asking NRG to file new conflict-of-interest
 11 forms for our attorneys to review.
 12 NRG has only recently responded to that
 13 letter with new forms, and our attorneys are
 14 reviewing those forms to make certain that
 20:05:40 15 there is no legal conflict of interest.
 16 MR. DANIEL SERRES: Are those documents
 17 public?
 18 MR. FRIEDMAN: I believe the letter to NRG
 19 is public, yes.
 20:05:52 20 Everyone who signed the sign-up list has
 21 had an opportunity to speak. Is there anyone

Public Meetings

3

K-138

PM3 RN-110607-FERCpm.txt
22 who has not spoken who wishes to?
23 That being the case, on behalf of the
24 FERC, I would like to thank all of you for
20:06:08 25 being here tonight, providing us with your
71
20:06:10 1 comments on our draft Environmental Impact
2 Statement for the Bradwood Landing LNG project.
3 Let the record show that this meeting concluded
4 at approximately 8:05 p.m. Thank you.

Public Meeting Transcript of Proceedings
Wednesday, November 7, 2007, 9:00 a.m.
Longview, Washington

The introductory comments for this public meeting are not included in the FEIS because they are very similar to those of the Monday, November 5, 2007, 6:30 p.m. meeting in Cathlamet, Oregon, which are included. The complete transcript of the Tuesday, November 6, 2007, 6:30 p.m. meeting in Clatskanie, Washington can be obtained at the FERC's internet website (www.ferc.gov) using the eLibrary link. Click on the eLibrary link, click on "General Search," and enter the docket number excluding the last three digits in the Docket Number field (i.e., CP06-366). Be sure you have selected an appropriate date range. For assistance, please contact FERC Online Support at FERCOnlineSupport@ferc.gov or toll free at 1-866-208-3676, or for TTY, contact (202) 502-8659.

PM4 RN-110707-FERCam.txt
 6 comments that cannot be summarized in those
 7 three minutes, we urge you to send in detailed
 8 written comments to the Commission.
 9 This is a meeting for you, the public, to
 09:23:51 10 comment on the DEIS. It is not a question-and-
 11 answer forum. Because many of our concerns are
 12 complex, the FERC staff would need to do
 13 additional research before addressing those
 14 issues in the FEIS. Therefore, I probably will
 09:24:04 15 not be able to give accurate and complete
 16 responses tonight to many of your questions. I
 17 will answer those questions if I know the
 18 answer to them, and I will address any
 19 questions having to do with administrative or
 09:24:15 20 process issues.
 21 Before we start hearing from speakers, I
 22 suggest we take a short, one-minute break in
 23 case any of you have not signed up with the
 24 speakers' list and wish to do so. Please go
 09:24:27 25 see Janelle, and we'll start again in about a
 □
 09:24:30 1 minute with you giving your comments. Thanks.
 2 (Recess at 9:24 a.m.)
 3 MR. FRIEDMAN: All right. Thanks for
 4 indulging me. We have a few that want to
 09:30:27 5 speak. Now I'm going to open the floor to
 6 individual comments. I ask that each speaker
 7 come up to the microphone that's right there.
 8 Hopefully it's working. We haven't tested it
 9 yet, but mine's working, so I assume that's
 09:30:40 10 going to work as well.

Public Meetings

4

PM4 RN-110707-FERCam.txt
 11 I'd like you to state your name and spell
 12 your last name for the court reporter, identify
 13 any organization you may be representing. If
 14 you are a landowner along the pipeline route,
 09:30:51 15 please indicate where your property is
 16 according to mile marks. If you don't know
 17 what your mile marks -- where your property is
 18 by mile mark, there are some NorthernStar staff
 19 people in the back. You can ask them, and I'm
 09:31:03 20 certain that they know the location of your
 21 property.
 22 The first speaker we have signed up is
 23 John Philbrook.
 24 MR. JOHN PHILBROOK: Hi. John Philbrook.
 09:31:16 25 Last name is spelled P-H-I-L-B-R-O-O-K.

17

PM4-1 09:31:22 1 I represent the ILWU, International
 2 Longshore and Warehouse Union. I am the
 3 president here locally, Local 21, and also the
 4 area chairman of the Columbia River area. So I
 09:31:34 5 represent those longshoremen that work in the
 6 Columbia River. Roughly, a little bit less
 7 than a thousand people, longshoremen I should
 8 say. And our comments today are basically
 9 along these lines.
 09:31:45 10 After reviewing the EIS amongst ourselves,
 11 after observing the two things that are most
 12 important for us, for our livelihood, which are
 13 the commerce of the river, specifically, and
 14 navigation and also the safety of the river,
 09:31:59 15 after reviewing these things we don't see a

PM4-1 Comment noted.

PM4-1 cont'd

PM4 RN-110707-FERCam.txt

reason why FERC should not grant NorthernStar the opportunity for the LNG.

Those things alone are enough for us to make sure that, as long as these things aren't compromised, then to us, we don't have an issue with that, and we would recommend that FERC grant the project, to be able to go ahead and move forward. Thank you.

MR. FRIEDMAN: Thank you for your comments.

09:32:27

Also, if I mispronounce your name, please correct me.

Next is Kevin Smith.

MR. KEVIN SMITH: Good morning. I live by milepost 38 there. I'm right next to a pump station before it goes up to the Williams. I am a union laborer. I worked on -- worked for Rockford putting in the last one. I do have one question before I do any comments. Is that gas line going on the north side of the Beaver line or the south side?

MR. FRIEDMAN: NorthernStar, is there someone back there who knows the answer to that?

UNIDENTIFIED SPEAKER: I don't know the answer, but I'll get that information to you.

PM4-2

PM4-3

MR. KEVIN SMITH: Well, I was pleased with their last job. At the end I was laid off before they hit my property because I have all the water rights there. I have a 70-year-old

Page 15

18

Public Meetings

4

PM4-2 Refer to Appendix B for pipeline location information.

PM4-3 We have recommended that on-site, third-party compliance monitors representing the FERC be present full-time during all pipeline construction phases (including restoration), and periodically during LNG terminal construction, to ascertain that the project is being built as outlined in this EIS, and in accordance with the environmental conditions of the FERC Order. Stumps or other debris would not be suitable backfill material and would not be used to fill in excavations created during pipeline construction.

PM4-3
cont'd

21 PM4 RN-110707-FERCam.txt
22 system that the company shrugged me off, and it
23 took me eight years to get everything back to
24 order myself. Last summer was the last thing
was done. I finally got my gates put in and my
road back.

09:33:46 25
□ 19

09:33:46 1 But the only comment and the only issue I
2 have is my water system, and they dug a 25-foot
3 hole and filled it up with stumps above it. Is
4 this going to be happening again, or are they
09:33:59 5 going to do a total cleanup like they're
6 supposed to, instead of the tail-end and just
7 get out of there? That's --

8 MR. FRIEDMAN: The answer is, they're
9 supposed to do a proper job of restoration, and
09:34:12 10 we'll have a third-party monitor checking on
11 them.

12 MR. KEVIN SMITH: This time, because as
13 soon as they got it in there, before the pump
14 station, they evacuated.

09:34:21 15 MR. FRIEDMAN: You're talking about -- for
16 those who don't know, I believe you're talking
17 about the KB pipeline.

18 MR. KEVIN SMITH: Beaver pipeline, yeah.

19 MR. FRIEDMAN: Yes. He's talking about a
09:34:29 20 different company. It's jurisdictional, but a
21 different company. We're going to have a
22 third-party monitor on site 24/7 to make
23 certain those kind of problems don't happen.

24 MR. KEVIN SMITH: All right. It was a
09:34:42 25 good job until the very last. That's the

□ 20
Page 16

Public Meetings

PM4 RN-110707-FERCam.txt

09:34:44 1 comments I have. Thank you.
 2 MR. FRIEDMAN: Thank you for your
 3 comments.
 4 Next is Rob Quoidbach. Please correct me
 09:35:00 5 if I got that wrong.
 6 MR. ROB QUOIDBACH: My name is Rob
 7 Quoidbach. It's Q-U-O-I-D-B-A-C-H.
 8 (Reporter requests clarification.)
 9 MR. ROB QUOIDBACH: Q-U-O-I-D as in dog, B
 09:35:39 10 as in Boston, A-C-H. Quoidbach, one word. I'm
 11 a property owner on mile 27 of the proposed
 12 pipeline.
 13 I have prepared a letter to send to the
 14 County regarding the EIS, and I -- if you don't
 09:35:53 15 mind, it's a very short letter, I will read it
 16 for my comments.
 17 MR. FRIEDMAN: Okay.
 18 MR. ROB QUOIDBACH: As a property owner
 19 with the KB pipeline running through
 09:36:01 20 three-quarters of a mile of my forest land,
 21 plus my experiences with a BS in civil
 22 engineering, 45 years as an industrial
 23 contractor, ten years as a docking district
 24 supervisor, and ten years on the Washington
 09:36:16 25 State Forest Practices Appeals Board, I feel
 □

21

09:36:19 1 well-qualified to criticize the pipeline
 2 portion of the DEIS.
 3 My tree farm at 230 -- 230 Grasset Poston
 4 Road will be adjacent to the proposed pipeline
 Page 17

PM4-4

Public Meetings

4

PM4-4

If the proposed project is authorized by the FERC, NorthernStar would be required to implement an environmental complaint resolution procedure which would provide a method for landowners to identify environmental mitigation problems/concerns during construction of the project and restoration of the right-of-way. See our response to comment PM2-4.

PM4 RN-110707-FERCam.txt		
PM4-4 cont'd	09:36:36	5 for one-half mile and then impacted by it for
		6 one quarter of a mile. Maybe if we listen,
		7 history wouldn't have to repeat itself. I have
		8 experienced the false promises of the KB group
		9 to replant trees, to plant for wildlife, to
	09:36:51	10 maintain property screen, to clear only ten
		11 feet on top of the pipe, none of which happened
		12 because permits are granted and nobody follows
		13 up.
		14 The draft DEIS contains pipeline gray
	09:37:05	15 areas that need attention. 4.8, 3.5, that's a
		16 reference, tax revenues, page 4-351 states:
		17 Property taxes on the pipeline would be
PM4-5		18 assessed by and paid to Cowlitz County in
		19 Washington.
	09:37:26	20 Property taxes should be clearly specified
		21 as to real estate and personal property taxes.
		22 Current county policy unfairly charges the
		23 landowner for real estate taxes and the
		24 pipeline companies only for personal property
	09:37:41	25 taxes. In my case, three acres of forest land
		□
	09:37:45	1 have been converted to an industrial land with
		2 no back taxes regard, and the KB rides free
		3 with me paying their land tax. NorthernStar
		4 should be required to pay for all current
	09:37:57	5 real -- personal property and conversion back
		6 taxes.
PM4-6		7 Section 4.4.2.3, existing upland
		8 vegetation, page 4-115 states, quote: In areas
		9 where timber would be harvested, the trees
Page 18		

Public Meetings

4

PM4-5 The EIS discusses taxes that may be paid by NorthernStar to local jurisdictions in section 4.8.

PM4-6 Landowners would be allowed to include provisions in the easements that are negotiated with NorthernStar for the sale of merchantable timber. As discussed in section 4.7.3.1, easement negotiations are a private legal matter between NorthernStar and the landowner.

PM4 RN-110707-FERCam.txt		
PM4-6 cont'd	09:38:17	10 would be cut and stacked for commercial sale.
		11 The logs would be hauled to the market and the
		12 proceeds of the sale collected by the property
		13 owner.
		14 This is not the way it is done.
	09:38:27	15 NorthernStar should conduct a timber cruise,
		16 pay for the timber rights, take out DNR forest
		17 practices permits, and pay for the value of any
		18 reproduction trees that are not yet ready for
		19 market.
PM4-7	09:38:41	20 Section 2.3.3, pipeline and associated
		21 facilities, page 2-35 states: Where the
		22 Bradwood pipeline would -- where the Bradwood
		23 pipeline would be adjacent to the existing KB
		24 pipeline, the temporary construction
	09:38:58	25 right-of-way would overlap onto the existing
		23
	09:39:01	1 permit right-of-way. The overlap would be up
		2 to ten feet but no closer than 15 feet from the
		3 existing pipeline.
PM4-8		4 Will the property owner be paid for this
	09:39:15	5 encroachment? In other words, they are
		6 encroaching on our existing pipeline with no
		7 mention about who's paying for it or why, why
		8 they get the right to do that.
		9 On a large portion of my land, the KB pipe
	09:39:30	10 is 20 feet from the property line. That's only
		11 five feet of spoil could be deposited if 15
		12 feet takes precedent. Finally, there should be
		13 a standard easement with site-specific clauses
		14 plus a liability hold-harmless clause stating
		Page 19

Public Meetings

4

PM4-7 See our response to comment PM2-4.

PM4-8 See section 2.3.3 of the EIS. NorthernStar proposes to use a typical 100-foot-wide construction right-of-way, and maintain a 50-foot-wide permanent easement. In cases where the Bradwood Landing pipeline would be adjacent to the KB pipeline, the temporary construction right-of-way for the proposed Bradwood Landing pipeline would overlap about 10 feet of the existing KB easement. As discussed in section 4.7.3.1, easement negotiations are a private legal matter between NorthernStar and the landowner and are, therefore, beyond the scope of this EIS.

Public Meetings

4

PM4 RN-110707-FERCam.txt

PM4-8
cont'd

09:39:48 15 that NorthernStar pays all current real estate
16 and personal property taxes, plus any
17 conversion back taxes; and upon the 50-year
18 life, page 2-63, abandonment of the pipeline,
19 there shall be a recorded reconveyance and
09:40:04 20 release of the right-of-way easement.

21 Thank you.

22 MR. FRIEDMAN: Thank you for your
23 comments.

24 Next is Phil Dines.

09:40:14 25 MR. PHIL DINES: Good morning. My name's
□

24

09:40:15 1 Phil Dines, D-I-N-E-S. I'm here to speak in
2 favor of this project, according to the DEIS.
3 I represent the Longview Kelso Building
4 Construction Trades Council.

PM4-9

09:40:28 5 Bradwood Landing, energy or -- excuse
6 me -- NorthernStar has provided the necessary
7 safety precautions that we've been requiring
8 all along. With the commerce along the river
9 that's currently taking place, with the

09:40:44 10 location of the proposed project being on an
11 existing mill site, we feel that these
12 precautionary measures have been met
13 satisfactorily. So we are, therefore,
14 endorsing the support for this project at this
09:40:58 15 time.

PM4-10

16 Also, on an economical standpoint, what --
17 the advantages of having natural gas coming to
18 the region. Recently we've seen the proposed
19 layoffs from Longview Fibre, and a lot of that
Page 20

PM4-9 Comment noted.

PM4-10 Comment noted.

PM4 RN-110707-FERCam.txt

PM4-10
cont'd

09:41:13 20 is just cost of doing business. Natural gas is
 21 one of the primary sources that the
 22 manufacturing and industrial plants here
 23 locally use. If we can keep these costs down,
 24 hopefully we can keep more of these industries
 09:41:26 25 or entice other manufacturing jobs to come to a

25

09:41:30 1 region instead of just slipping away and
 2 becoming retail industry here locally.

3 Thank you.
 4 MR. FRIEDMAN: Thank you for your
 09:41:38 5 comments.

6 At this time we're going to go back to
 7 people who have already spoken at other
 8 meetings, unless there's someone from the floor
 9 who wishes to speak who was not signed up, who
 09:41:47 10 has not previously spoken. Is there anyone who
 11 has not previously spoken who would like to
 12 talk at this time?

13 If not, then I'm going to ask Mr. Dragich
 14 to speak again.

09:41:58 15 MR. STEVE DRAGICH: Mr. Dragich,

PM4-11

16 D-R-A-G-I-C-H. I'll speak specifically about
 17 two items, one in the appendices of the DEIS,
 18 the open-trench method for laying the pipe
 19 through streambeds. I refer to Washington
 09:42:21 20 State Revised Code 76, forest practices,
 21 specifically riparian zones.

22 At present, citizens of the state of
 23 Washington who have forest land, which this
 24 pipeline will cross in this county, are
 Page 21

Public Meetings

4

PM4-11 The specific crossing method to be used on a particular stream is established as part of the COE and WDE permitting processes. In those instances where open cut is determined by the agencies to be acceptable, appropriate BMPs are mandated as part of the crossing to protect the associated resources.

PM4 RN-110707-FERCam.txt

PM4-11
cont'd

09:42:40 25 prohibited from this riparian zone, any and all
□ 26

09:42:46 1 practices or any disturbance whatsoever, yet
2 NorthernStar and FERC in their DEIS proposes
3 for certain streams on the Washington side for
4 an open-trench method, yet us citizens are
09:43:02 5 prohibited from this very method.

PM4-12

6 Second one concerns critical areas, mainly
7 unstable geologic areas. As you know, on the
8 Washington side there are 21 unstable noted
9 areas. Cowlitz County has an ordinance known
09:43:21 10 as the critical areas ordinance, currently
11 under review by their contractor, Parametrix
12 from Portland, Oregon. When asked in an open
13 meeting of this review of the critical areas
14 ordinance, will this ordinance apply to any
09:43:39 15 federally sanctioned project, i.e.,
16 NorthernStar's proposed pipeline, the answer
17 from the county's -- Cowlitz County's
18 contractor, Parametrix, was no, yet the
19 citizens of this county are subject to that
09:43:57 20 critical areas ordinance.

PM4-13

21 In your DEIS you state that they have to
22 apply the local land-use ordinances. Obviously
23 statements that I've just mentioned contradict
24 this.

09:44:13 25 MR. FRIEDMAN: Thank you for your
□ 27

09:44:13 1 comments.
2 Next is Robert Kiser.

Page 22

Public Meetings

4

PM4-12 The EIS addresses geological hazards along the pipeline route in section 4.1.4. The EIS discusses the Cowlitz County Critical Area Ordinance under local permits in section 1.3.11, and local land use zoning in section 4.7.3.2. Cowlitz County is the lead SEPA agency, and we hope that it will adopt our EIS. NorthernStar may voluntarily seek permits from Cowlitz County. The FERC encourages cooperation between applicants and local governments, but this does not mean that local agencies, using state or local laws, may prohibit or unreasonably delay projects approved by the FERC. Local permits must be consistent with the conditions of a FERC Certificate.

PM4-13 See our response to comment PM4-12.

PM4-14	09:44:31	3	PM4 RN-110707-FERCam.txt MR. ROBERT KISER: Kiser, K-I-S-E-R,
		4	Robert.
PM4-14	09:44:31	5	The impact statement is supposed to be
		6	driven by the process of scoping. The scoping
		7	process is part -- in part includes public
		8	comments as well as agencies determine issues,
		9	concerns, and opportunities. Although you
		10	mention 1-24 and 25, prefiling public scoping
		11	process and meetings, you have excluded
		12	comments from the public meetings that dealt
		13	with unsuitable soils and socioeconomic effects
		14	of landowners. All issues and concerns and
PM4-15	09:45:00	15	opportunities identified by the public need to
		16	be addressed in the DEIS.
		17	Criteria through the evaluated
		18	alternatives are not adequately addressed.
		19	There is no such advantaged way for the reader
		20	to evaluate alternatives against each other.
		21	This applies to alternative fees for various
		22	planned projects and activities but is
		23	especially important to determine all site and
		24	pipeline locations.
PM4-15	09:45:25	25	The criteria, again, should reflect the
		28	
		1	data developed from the scoping process. How
		2	can you select an alternative if you haven't
		3	evaluated all the alternatives in a systematic
		4	manner against issues, concerns, and
		5	opportunities, identify a preferred, and
		6	documented such?
		7	The DEIS only tells you the agency looked
			Page 23

Public Meetings

4

PM4-14 See our response to comment PM3-24. The EIS addresses potential project-related impacts on soils in section 4.2, and socioeconomic issues are addressed in section 4.8.

PM4-15 The EIS summarizes the results of the alternatives analysis and we looked at more details than may be apparent from the summary. We also considered whether alternatives were economically feasible. However, it was not feasible to do a detailed comparison of costs as part of the analysis.

PM4-15 | 8 PM4 RN-110707-FERCam.txt
 cont'd | 9 at other alternatives and discarded them. You
 09:45:50 | 10 can't even tell if you considered a broad range
 | 11 of alternatives, as required by NEPA. The
 | 12 criteria is subjective, not objective. You
 | cannot measure it.

PM4-16 | 13 The cover letter indicates a draft EIS
 | 14 addresses potential environmental effects
 09:46:06 | 15 associated with the construction and operation
 | 16 of the following facilities, looked at the
 | 17 proposed Bradwood Landing terminal. The letter
 | 18 also states that the DEIS also evaluates
 | 19 alternatives to the proposal. If the
 09:46:18 | 20 alternatives are equally evaluated, including
 | 21 no action against each other, why weren't other
 | 22 alternatives addressed with equal weight as the
 | 23 preferred Bradwood Landing and the pipeline
 | 24 alternative?

PM4-17 | 09:46:31 25 The DEIS is a draft decision document. 29
 | 09:46:35 1 This should not -- there should not be any
 | 2 questions left unanswered, especially ones
 | 3 involving environmental consequences. Several
 | 4 places it leaves it up to NorthernStar to do
 09:46:46 | 5 what they want rather than telling them what
 | 6 they must do. The document should leave --
 | 7 should leave -- should not leave any
 | 8 subjectivity to NorthernStar, FERC, COE, U.S.
 | 9 Coast Guard, or DOT, or the Commission,
 09:47:01 | 10 especially to the discretion of NorthernStar.

PM4-18 | 11 The mitigation plan for T and E species
 | 12 did not adequately compensate for loss of

Page 24

Public Meetings

4

PM4-16 The alternatives were evaluated at a detail necessary to determine that none had significant environmental advantages over the proposed project and could meet all of the project objectives. If an alternative had been able to meet all of the project objectives and been clearly environmentally superior, we would have evaluated it in greater detail.

PM4-17 See our responses to comments PM1-2 and PM3-47. Section 5 contains our recommendations, which would become requirements if adopted by the Commission as part of its Order authorizing the project.

PM4-18 As the lead federal agency, the FERC will develop determinations of effect for federally listed species and designated critical habitat. These determinations of effect will be included in the revised BA and EFH Assessment. However, quantification of take and the associated Incidental Take Statement would be developed and issued by the NMFS and/or FWS for the proposed project as part of the formal consultation process under section 7 of the ESA and the MSA. Additional information on the formal consultation process is included in section 4.6 of the EIS.

PM4-18
cont'd

PM4-19a

PM4-19b

PM4-20

PM4 RN-110707-FERCam.txt
habitat and taking of species. No reference
has been found to requiring a take permit of a
T and E species. There is no question that the
dredging and subsequent valve water intake will
take T and E fish species. The recovery plan
for T and E species aggressively enhances
these.

An enhancement plan specifies marine
fishery service is needed prior to approval of
EIS. There is no mention of approval of an
enhancement plan. The trenching across many of
the streams reviewed on the maps provided is
not compatible with requirements of the

Washington Park and Natural Resources.
MR. FRIEDMAN: Mr. Kiser, can you wrap it
up?

MR. ROBERT KISER: Okay. The product that
you have here is, in my estimation, very poorly
written. The document will not pass muster.
It's got to be rewritten, reissued, and a
pellet could hit it with a slingshot; he
wouldn't have to hit a shotgun. It's got to
pass muster and get to the final in the form
that it will survive. This won't do it.

MR. FRIEDMAN: Thank you for your
comments.

I do have one point of clarification on
whether or not the EIS is a decision document.
It is not a decision document. It is a
staff-written document, and therefore uses the

Page 25

Public Meetings

4

PM4-19a See our response to comment FA2-10.

PM4-19b See our response to comment PM4-11.

PM4-20 We disagree. We believe the EIS has been properly prepared to comply with the NEPA.

PM4-21	18	PM4 RN-110707-FERCam.txt term "recommendation." The Commissioners, the	
	19	five Commissioners who make decisions, their	
	09:48:51 20	decision document is called a project order,	
	21	and the conditions of that order will use words	
	22	such as "shall."	
	23	UNIDENTIFIED SPEAKER: If I may, please,	
	24	the NEPA process requires a decision. Is that	
	09:49:07 25	going to be the Commission's decision? If so,	31
	09:49:10 1	they have to abide by NEPA. Right?	
	2	MR. FRIEDMAN: The Commission order will	
	3	adopt the EIS.	
	4	UNIDENTIFIED SPEAKER: Okay. And the	
	09:49:18 5	decision of the Commission is appealable?	
	6	MR. FRIEDMAN: That is correct, by	
	7	intervenors who will have standing in the	
	8	proceeding.	
	9	UNIDENTIFIED SPEAKER: Right.	
	09:49:29 10	MR. FRIEDMAN: Are there any other	
	11	questions from the floor?	
	12	Yes, sir. Would you please -- you have to	
	13	come up here, state your name, spell your last	
	14	name for the court reporter, and provide us	
	09:49:39 15	your comments.	
PM4-22	16	MR. ROBERT KEENUM: Yes. My name is	
	17	Robert Keenum, K-E-E-N-U-M.	
	18	The only question I have -- I represent no	
	19	one except the community and the people that	
	09:49:50 20	enjoy the river here. I was a little surprised	
	21	to see this terminal being established so far	
	22	upriver. I know no one wants LNG-type	
Page 26			

Public Meetings

4

PM4-21 See our responses to comments PM3-51. The EIS is not a decision document, the Commission Order is.

PM4-22 Several LNG terminals are located inland along rivers including: the Cove Point LNG terminal is located approximately 100 miles from the mouth of Chesapeake Bay; the Distrigas terminal in Everett, Massachusetts is located approximately 5 miles inland from Boston Harbor; Elba Island is located approximately 9 miles up the Savannah River; the Trunkline LNG terminal is located approximately 48 miles up the Calcasieu River/Ship Channel; the Sabine Pass LNG terminal is located 3.7 miles up the Sabine Pass River; and the LNG terminal at Freeport/Quintana Island is located 6 miles up the Freeport ship channel.

PM4-22 23 PM4 RN-110707-FERCam.txt
 cont'd 24 terminals near them, but we all need them
 09:50:05 25 somewhere, but I was surprised to see it so far
 upriver. 32
 09:50:05 1 My question is: Are there other LNG
 2 terminals in the United States that are 38
 3 miles up a river?
 4 MR. FRIEDMAN: I don't know, but we'll --
 09:50:21 5 we'll do some looking. I will say there are
 6 LNG terminals located on rivers. I believe
 7 Elba in Georgia is located on a river. Cove
 8 Point in Maryland is located on the Chesapeake
 9 Bay. And the District Gas LNG terminal in
 09:50:37 10 Boston is located up a river in Boston Harbor.
 11 So there are -- there are LNG terminals located
 12 on rivers inland from the ocean.
 13 MR. ROBERT KEENUM: Right. And security
 14 reasons and environmental reasons, 38 miles, I
 09:50:49 15 recognize -- the farthest one I found upriver
 16 was five miles. I'm not an expert by any
 17 means. 38 miles to me is something that should
 18 be seriously considered.
 19 MR. FRIEDMAN: For people who don't
 09:51:02 20 understand how siting occurs, it is the project
 21 proponent, NorthernStar, who picks a location,
 22 and then the FERC analyzes the environmental
 23 impacts of that proposal.
 24 MR. ROBERT KEENUM: Thank you.
 09:51:12 25 MR. FRIEDMAN: Thank you. 33
 09:51:15 1 Are there any other questions or comments
 Page 27

Public Meetings

PM4 RN-110707-FERCam.txt

2 from the floor?

3 If not, then that brings to conclusion

4 this morning's public meeting. I would like to

09:51:27 5 thank you all here on behalf of the FERC for

6 coming and providing us your comments on the

7 DEIS for the Bradwood Landing LNG terminal.

8 And let the record show that this morning's

9 meeting was concluded, after all comments were

09:51:41 10 taken from the floor, at approximately 9:50

11 a.m. Thank you very much.

12 (Recess at 9:51 a.m.)

13 MR. ARTHUR JOHNSON: Well, thank you. My

14 name is Arthur Johnson. I live at 167 Jackson

10:02:59 15 Road, Longview, Washington. It's a yew fallow

16 heights district (phonetic).

17 As a landowner, I'm going to be directly

18 affected by this pipeline construction. I'm a

19 third-generation owner of an 80-acre tree farm,

10:03:13 20 and I've been very active in it for quite

21 some -- quite a long time. The pipeline will

22 be constructed about a quarter of a mile across

23 my property and leave, of course, about a

24 50-foot-wide scar that will in turn over the

10:03:26 25 period of years never be used for much of

□

34

10:03:29 1 anything, since it's going to be part of a tree

2 farm. Trees will not be able to be planted on

3 it. It will be more or less a grassy strip,

4 I'm afraid.

10:03:37 5 The trees on my property that are where

6 the pipeline is running right now are almost

Page 28

Public Meetings

4

PM4-23 See our response to comment PM2-4.

Public Meetings

4

PM4 RN-110707-FERCam.txt

PM4-23
cont'd

7 near maturity, but they could go for another
8 several more years to reach full maturity and
9 full value, so I feel I will be cheated if the
10:03:52 10 pipeline is built because I will not receive
11 full value for my trees.
12 Now, in the EIS statement, the Bradwood
13 EIS statement, it makes some comments in there
14 that they're about to harvest the timber. I
10:04:02 15 feel some of those -- statements are quite
16 vague. They're quite brief. They're quite
17 short. They're not right to the point.
18 There's a lot of leeway there for the
19 construction company to deal with me. I don't
10:04:15 20 have -- I have serious questions about who will
21 harvest the timber, how they will do it, and
22 what means they go by, and of course I have
23 some very serious question about will I receive
24 full payment for my trees in the aftermath.

PM4-24

10:04:30 25 I have great concerns about the
□
10:04:32 1 construction of the pipeline itself, even
2 though in the EIS brochure they talk about all
3 the procedures and the things that they are
4 going to do, but it's been my experience in the
10:04:45 5 past, when the adjacent KB pipeline that was
6 built about a decade ago, that the construction
7 company there was quite careless. They left
8 the land in quite a disturbed state.
9 The land there actually is relatively
10:04:59 10 flat, and it was quite smooth, but the
11 aftermath was that the land was left in rather
Page 29

35

PM4-24 See our response to comment PM4-4.

PM4 RN-110707-FERCam.txt

PM4-24
cont'd

12 rough form. There are a lot of dips. There
13 are minor ridges and little hills, little
14 gullies. They're small, but they're
10:05:15 15 significant enough that when you run equipment
16 across it, like I do on occasion, it's quite
17 rough -- difficult to operate equipment on.
18 One of the most harmful things done in the
19 construction of the KB pipeline was that they
10:05:28 20 buried a lot of wood in the pipeline, stumps,
21 all kinds of chunks of wood. That wood now is
22 rotting, and when it rots, the potholes and the
23 surface of the pipeline, and actually some of
24 the wood surfaces when you run equipment across
10:05:40 25 it, it becomes quite difficult to do so. 36
□

10:05:43 1 Even though in the EIS brochure, the
2 statement, they're saying that they're going to
3 be careful about those things, I have some
4 severe doubts because I have doubts that there
10:05:55 5 is good enough government oversight of the
6 construction practices. I have this fear that
7 I will have to rent and operate some equipment
8 to rectify the situation just to make the
9 surface into a more suitable form.

10:06:12 10 This gentleman right here, Ralph
11 Quoidbach, an adjacent landowner, has become
12 quite a good friend of mine, and he was at --
13 the KB pipeline was constructed on his
14 property. He has gone into explicit detail
10:06:25 15 over the years explaining to me his
16 negotiations with the lease agreement, which he
Page 30

Public Meetings

PM4-24
cont'd

PM4 RN-110707-FERCam.txt

17 said were quite unsatisfactory and unsavory.
18 He has discussed actually in quite detail the
19 construction of the pipeline, the promises made
10:06:41 20 by the construction company, and all the
21 promises that were broken, all the mishaps, all
22 the bad things that have happened.
23 And, in turn, he has been left in, shall
24 we say, a shallow bitterness about the whole
10:06:57 25 thing. No matter where discussions are, at
□ 37

10:06:59 1 some point in time the discussion always comes
2 back to the construction of the KB pipeline.
3 He has been left a bitter man.
4 If the Bradwood pipeline would be
10:07:11 5 constructed on my land, I will feel that the --
6 my land will be violated and, in turn, I will
7 be violated too because I am part of that land.
8 If you drive west of Longview here, there
9 is a cemetery there, Bunker Hill Cemetery. I
10:07:26 10 have a tombstone out there already, and on that
11 tombstone it says -- there's a Finnish phrase
12 inscribed on the tombstone called maa poika.
13 Maa poika in English means son of the soil.
14 And I have always be the son of the soil
10:07:45 15 because I have been so attached to my land
16 because it's been in the family for now a third
17 generation. And if the pipeline is built, I
18 will feel that I will have been violated too.
19 Thank you for your time.
10:08:00 20 MR. FRIEDMAN: Thank you for your
21 comments. The one thing -- because you came a
Page 31

Public Meetings

Public Meetings

4

PM4 RN-110707-FERCam.txt

22 little late, you didn't hear my response
 23 earlier, about how FERC is going to monitor
 24 construction and restoration. We're going to
 10:08:16 25 require that NorthernStar hire a third-party
 □ 38

10:08:20 1 monitor, environmental monitor, to monitor all
 2 construction and restoration activities. So
 3 there will be somebody around to watch
 4 construction activities all the time.

10:08:30 5 There are three other people who have come
 6 in after I reopened this meeting, and we're
 7 going to give them an opportunity to speak.

8 Jared Ross.
 9 MR. JARED ROSS: Did you want my address
 10:08:45 10 too?

11 MR. FRIEDMAN: Yes. Spell your name for
 12 the court reporter.

13 MR. JARED ROSS: My name is Jared Ross,
 14 J-A-R-E-D, Ross, R-O-S-S. My address is P.O.
 10:08:53 15 Box 278, Adna, Washington.

16 MR. FRIEDMAN: If you're a landowner on
 17 the pipeline, provide us a milepost.

18 MR. JARED ROSS: A what?

19 MR. FRIEDMAN: A milepost, if you know
 10:09:02 20 where it is.

21 MR. JARED ROSS: No, I don't.

PM4-25 22 95822. I'm here just to support the
 23 Bradwood Landing/NorthernStar natural gas --
 24 NorthernStar pipeline. That's all I have to
 10:09:13 25 say. Thank you.
 □ 39

PM4-25 Comment noted.

PM4 RN-110707-FERCam.txt

10:09:17 1 MR. FRIEDMAN: All right.

 PM4-26 3 MS. SHERRY BARRY: Hi, my name is Sherry
 4 Barry, and you spell that S-H-E-R-R-Y,
 10:09:29 5 B-A-R-R-Y. And I also -- my address is 811
 6 Bluff Avenue in Hoquiam, Washington. And I
 7 just am here today to also let you know that I
 8 support the Bradwood Landing project and the
 9 pipeline that will go in following it. Thank
 10:09:46 10 you.
 11 MR. FRIEDMAN: Thank you for your
 12 comments.
 13 Next is Glenn Willman.
 14 MR. GLENN WILLMAN: Hi. I'm Glenn
 10:09:55 15 Willman, G-L-E-N-N, W-I-L-L-M-A-N. My address
 16 is 1914 Olympia Way, Longview, Washington,
 17 space 13.
 PM4-27 18 I'm business manager of the laborers'
 19 local union here in town, and I support the
 10:10:08 20 Bradwood Landing and the NorthernStar pipeline.
 21 It will provide quite a few jobs for my
 22 members, family wages, benefits, and keep it
 23 here locally.
 24 MR. FRIEDMAN: Thank you for your
 10:10:18 25 comments.

40

10:10:19 1 Is there anyone else who did not earlier
 2 have an opportunity to speak who would like to
 3 speak? If not, then I'm once again going to
 4 close the meeting with the understanding that,

Page 33

Public Meetings

4

PM4-26 Comment noted.

PM4-27 Comment noted.

Public Meetings

4

PM4 RN-110707-FERCam.txt
 10:10:30 5 should people come in later who wish to speak,
 6 I will reopen it. The time is now 10:10 a.m.
 7 Thank you.

8 (Recess at 10:10 a.m.)

9 MR. FRIEDMAN: I'm going to open up the
 10:33:52 10 meeting again at approximately 10:30 a.m., and
 11 we're going to take another public comment.

12 So please state your name and spell your
 13 name for the record.

14 MR. JIM PROULX: My name, Jim Proulx,
 10:34:06 15 P-R-O-U-L-X. Actually, I'd like to speak on
 16 both myself and perhaps a little bit about our
 17 company's support for this project. Okay?

18 I've lived here for about 30-plus years.
 19 I hunt, fish. I do a lot of activities,
 10:34:24 20 exactly where this project is being considered
 21 to be built. So I've enjoyed the environmental
 22 fruits of the area, and I don't have any issues
 23 as a hunter, as a fisherman. I don't have any
 24 issues, and neither do the friends that I hunt
 10:34:43 25 and fish with. So, I understand the tankers

41

PM4-28

10:34:46 1 coming in and the construction along the river
 2 and all those types of things. It is not going
 3 to impact me personally any more than any of
 4 the typical river traffic that's going on now.

10:35:00 5 As a matter of fact, on a personal note,
 6 okay, I've been disappointed to see this region
 7 lose so many of the big industries that have
 8 been supporting a lot of families with
 9 good-paying jobs. I know that there's been

Page 34

PM4-28 Comment noted.

PM4-28 10:35:14 10 PM4 RN-110707-FERCam.txt
 cont'd 11 one, two, three -- four big aluminum plants
 12 along the Columbia River that have -- in the
 13 last few years they've closed and they've gone
 14 away, and those businesses close, those jobs
 15 have gone away. And I see pulp and paper, I
 10:35:27 16 see other industries that take advantage of the
 17 same locations. They're going. They're going
 18 to different countries, but they're leaving
 19 this area.
 20 So on a personal note, I'd certainly like
 10:35:40 21 to see this project come to fruition for -- for
 22 more jobs, more industry moving into this area,
 23 and it's kind of a domino effect.
 24 As a business, I work for a company called
 10:35:59 25 Harder Mechanical Contractors. We're a big
 □ construction company. 2008 is our -- will be 42
 10:36:01 1 our 75th year of doing business. We actually
 2 started our company in Astoria, Oregon, in
 3 1934. So -- and our headquarters are here in
 4 Portland. We're one of the largest
 10:36:13 5 contractors, actually in the United States, but
 6 certainly the largest in this area.
 7 We've got a lot of people that live and
 8 work all around this area, okay, up and down --
 9 from Astoria to Portland, Oregon, Washington.
 10:36:32 10 I can't speak for all of them, but I've spoken
 11 to a lot of them, and it's pretty unanimous.
 12 There's a lot of support within our company.
 13 We are a construction company, so we'd
 14 like to see this thing happen, of course, but

Public Meetings

Public Meetings

4

PM4-28
cont'd

PM4 RN-110707-FERCam.txt

10:36:45 15 for those same reasons: It's going to bring
16 good jobs. It's going to -- it's not going to
17 be harmful to their way of life, whatever
18 issues. There's a lot of skill in this area.
19 This is -- this is a high-tech area. Intel
10:37:02 20 builds their world-class wafer-manufacturing
21 facilities here.
22 There's some really skilled labor that has
23 been enjoying this big, industrial region for a
24 long time. They're very, very safe. I think
10:37:17 25 we set records for the safe work performance of
□ 43

10:37:22 1 not only our company but of this area as well.
2 So, you know, we've got a big company.
3 This area has been supporting large complex
4 industries like this for many, many years. The
10:37:38 5 quality of the construction, if this facility
6 was to be built, would be the highest. Nobody
7 here, but I'd like to comment on that. I don't
8 think there would ever be any issues with the
9 construction, the safe work performance on a
10:37:56 10 project like this.
11 It is a large project. We build -- this
12 region has built many, many large projects,
13 larger projects than this. Okay. So from a
14 construction standpoint, we see it as a very
10:38:10 15 successful opportunity. As a personal
16 standpoint, we don't see any issues with this,
17 and we're in -- personally, I'm in support of
18 it, and as a company I'd like to go on record
19 that we very much support this project. And I

10:38:27 20 PM4 RN-110707-FERCam.txt
believe that's all I got to say.
21 MR. FRIEDMAN: Thank you very much for
22 your comments.
23 MR. JIM PROULX: Okay.

Public Meeting Transcript of Proceedings
Wednesday, November 7, 2007, 6:30 p.m.
Longview, Washington

The introductory comments for this public meeting are not included in the FEIS because they are very similar to those of the Monday, November 5, 2007, 6:30 p.m. meeting in Cathlamet, Oregon, which are included. The complete transcript of the Tuesday, November 6, 2007, 6:30 p.m. meeting in Clatskanie, Washington can be obtained at the FERC's internet website (www.ferc.gov) using the eLibrary link. Click on the eLibrary link, click on "General Search," and enter the docket number excluding the last three digits in the Docket Number field (i.e., CP06-366). Be sure you have selected an appropriate date range. For assistance, please contact FERC Online Support at FERCOnlineSupport@ferc.gov or toll free at 1-866-208-3676, or for TTY, contact (202) 502-8659.

Public Meetings

Public Meetings

5

11 PMS RN-110707-FERCpm.txt
 have comments that take more than three minutes
 12 to express, please summarize your main points
 13 tonight and write detailed letters to the FERC.
 14 This is a meeting for you, the public, to
 18:54:52 15 comment on the DEIS. It is not a question-and-
 16 answer forum. Because many of your concerns
 17 are complex, the FERC staff would need to do
 18 some additional research before addressing
 19 those issues in the FEIS. Therefore, I
 18:55:05 20 probably would not be able to give accurate or
 21 complete responses tonight. For those
 22 questions where I do know an answer, I'll
 23 provide it, and I may be able to answer some
 24 questions having to do with administrative or
 18:55:15 25 process issues.

17

18:55:17 1 Before we start hearing from speakers
 2 tonight, I suggest we take a very short break
 3 of a couple of minutes. This will give anyone
 4 an opportunity who has not signed up to speak
 18:55:25 5 an opportunity to go back to Janelle and sign
 6 our speakers' list. So let's do that right
 7 now, and I'll reconvene in about three minutes.
 8 (Recess.)

9 MR. FRIEDMAN: Mr. Castle? Is Bill Castle
 18:58:12 10 here? Did you speak at an earlier meeting?

11 MR. BILL CASTLE: I spoke at the first one
 12 in Clatskanie, yes.

13 MR. FRIEDMAN: Thank you.

14 Because this is not an overwhelming list,
 18:58:29 15 we're going to just call up one person at a

Public Meetings

5

16 PMS RN-110707-FERCpm.txt
 time. It's a small enough room and a small
 17 enough audience, and I think we can do that and
 18 still move the meeting along.
 19 So the first person on here -- oh, by the
 18:58:40 20 way, if I -- I often mess up people's names and
 21 pronunciations. So please correct me when I
 22 mispronounce your name.
 23 We're now going to open the floor to
 24 individual comments. I ask that each person
 18:58:54 25 come up to the microphone here. These are
 □ 18
 18:58:57 1 working much better than some of our other
 2 microphones at other venues. You all can hear
 3 me clearly. Correct? And I believe if you
 4 speak up in this microphone, that you will also
 18:59:09 5 be heard clearly by everyone in the back of the
 6 room.
 7 I want to you state your name for the
 8 record and spell your last name for the court
 9 reporter, identify any organization you may
 18:59:19 10 represent. If you are a landowner along the
 11 pipeline route and you know where your property
 12 is located according to mile marks, please tell
 13 us. If you don't know where your property is
 14 located according to mile marks, there are some
 18:59:30 15 representatives of NorthernStar here, and they
 16 might be able to help you figure out what
 17 milepost your property is located at.
 18 The first speaker I have on the list
 19 tonight is Charlotte Piersons.
 18:59:48 20 MS. CHARLOTTE PERSONS: Hi. I'm actually

PM5-1		21	PM5 RN-110707-FERCpm.txt Charlotte Persons, P-E-R-S-O-N-S. I live in	
		22	Kelso. I do not live anywhere near a pipeline.	
		23	I am here to represent Willapa Hills Audubon	
		24	Society, and we are mostly concerned with	
	19:00:00	25	environmental issues. One of them is carbon	19
	19:00:06	1	dioxide emissions.	
		2	Page 4-382 states, to date, NorthernStar	
		3	has not indicated whether they intend to	
		4	voluntarily comply with the ODET requirements	
	19:00:16	5	for control of gases contributing to global	
		6	warming. FERC, as the U.S. entity with the	
		7	most direct effect on government policy	
PM5-2		8	regarding global warming impacts of new energy	
		9	facilities, should take responsibility for	
	19:00:31	10	requiring new facilities to comply with limits	
		11	on carbon dioxide and other greenhouse gases.	
		12	We ask that FERC use its ability -- its	
		13	authority to do so in this case.	
		14	Furthermore, carbon dioxide emissions are	
	19:00:48	15	a part of this kind of facility, partly because	
		16	of transportation of the LNG from far	
		17	distances -- other countries, Alaska -- partly	
		18	from the burning of natural gas by customers	
		19	who are end customers. We ask that FERC	
PM5-3	19:01:06	20	encourage other forms of energy -- solar, wind,	
		21	tidal, and the like -- rather than going ahead	
		22	and approving LNG facilities.	
		23	There are also some other specific things	
		24	that we have problems with in terms of	
	19:01:26	25	mitigation. One is eagle habitat. While no	20
			Page 16	

Public Meetings

5

PM5-1 Section 4.10.1.2 of the final EIS has been updated to indicate that NorthernStar has agreed to voluntarily comply with the Oregon Department of Energy's siting requirements for non-generating energy facilities, including the CO₂ emission standards, for the proposed LNG import terminal.

PM5-2 We address CO₂ emissions in section 4.10. The FERC does not promote one form of energy over another, but we discuss energy alternatives in section 3.

PM5-3 The bald eagle's life history and occurrence within the project area as well as potential impacts due to construction and operation of the Bradwood Landing Project are described in sections 4.6.1.2, 4.6.2.1, 4.6.2.2, and 4.6.2.3. The FWS's National Bald Eagle Management Guidelines (2007) recommend a buffer of at least 660 feet between construction activities and bald eagle nests during the breeding season. The nearest bald eagle nest is located 0.4 mile (over 2,000 feet) from the proposed project area. In addition, section 4.6.2.2 describes measures that NorthernStar would implement to minimize impacts on bald eagles in the vicinity of the project and the FERC staff's recommendation that NorthernStar conduct additional surveys for bald eagles, where necessary, prior to construction of LNG terminal and pipeline facilities. Therefore, adverse impacts on bald eagles as a result of the proposed project are not anticipated and the implementation of additional mitigation measures is not warranted.

PM5 RN-110707-FERCpm.txt

PM5-3
cont'd

19:01:29 1 longer listed as an endangered species, eagles
2 are still protected under a variety of acts. A
3 failure of the DEIS is that the impact study
4 makes no mention of the specific needs of
19:01:40 5 individual eagles that currently use the area
6 in and near the Bradwood site.
7 The Peterson Point area proposed to
8 mitigate for 30 acres of forested land
9 destruction on the site, page 4-156, is already
19:01:54 10 being preserved by Duck Hunters Unlimited.
11 There is no plan mentioned to identify the
12 current population of eagles and then to
13 monitor from Peterson Point to see if those
14 eagles currently using this area actually --
19:02:11 15 actually move to the new area.
16 In fact, they may not do so as there are
17 already eagles nesting in that area, and eagles
18 do not share nesting territory. There should
19 also be a backup plan for other forested
19:02:26 20 mitigation areas to be created if the current
21 plan is not successful.

PM5-4

22 Another habitat mitigation problem that we
23 notice is the Hunt Creek/Clifton Channel
24 mitigation site. Section 4.5.2.1, page 4-152,
19:02:43 25 states: There is no plan to monitor the
□
19:02:45 1 success of the site as the only upkeep will be
2 the removal of noxious weeds. We ask that this
3 site be monitored to see if it is indeed acting
4 as a mitigation site, especially for federally
Page 17

PM5-4 See our response to FA2-10.

PM5 RN-110707-FERCpm.txt

19:02:57 5 listed salmon and starry flounder habitat use.

6 Thank you.

7 MR. FRIEDMAN: Thank you for your

8 comments.

9 Next on the list is Laurie Caplan.

19:03:17 10 MS. LAURIE CAPLAN: My name is Laurie

11 Caplan. I'm from Astoria. I'm speaking for

12 myself, but I'm also a member of RiverVision

13 and Columbia Riverkeeper.

14 People in Clatsop County frequently ask me

19:03:34 15 why -- why oppose this project, and I tell them

16 there are hundreds of economic, safety, and

17 quality-of-life reasons to oppose this, but of

18 course tonight we're talking about

19 environmental reasons. So I would like to

19:03:48 20 raise three environmental questions and one

21 process one.

22 First, I'm all for international

23 cooperation. I'm very concerned, however, that

24 cooperation in this field means that we are

19:04:07 25 relying or would be relying on importing LNG

□

22

19:04:12 1 from countries that are not only authoritarian,

2 but are openly hostile to the United States,

3 including Iran, Russia, and Qatar. Also, just

4 the pollution and environmental degradation

19:04:33 5 that comes from extracting, processing, and

6 shipping this material from all over the globe

7 creates its own separate set of problems

8 related to pollution and further environmental

9 degradation.

Page 18

Public Meetings

5

PM5-5 See our response to comment PM2-39.

PM5 RN-110707-FERCpm.txt

PM5-5
cont'd

19:04:48 10 So what I'm wondering is: why would the
11 federal government support a project that makes
12 this country more dependent on a fossil fuel,
13 especially a fossil fuel that comes from
14 hostile countries, since that seems to be the
19:05:05 15 source of a good many of our problems right
16 now?

PM5-6

17 Secondly, all of us on the north coast are
18 grateful that we don't have hurricanes and
19 tornados, but we know that we face earthquakes
19:05:17 20 and slides, and in Astoria it's a tourist
21 attraction to drive around and show people
22 where the slides are. Even in areas that have
23 been built up for decades, we still get slides.
24 And as I understand it, the Bradwood site
19:05:34 25 and the pipeline route are going in earthquake

23

19:05:41 1 areas and slide areas, and it's kind of unreal
2 for me that we're even having a discussion
3 about this because it is such a ridiculous site
4 to do any of this kind of project, especially
19:05:55 5 one that poses its own set of problems if
6 anything goes wrong.

PM5-7

7 I would like to suggest that you update
8 your geologic and seismic information in the
9 DEIS. It's seriously out of date. There is
19:06:12 10 much more current, technologically accurate
11 information than the DEIS presents.

PM5-8

12 So my second question is: why would the
13 federal government even consider siting such a
14 massive project on such a fragile ecosystem and
Page 19

Public Meetings

5

PM5-6 Earthquake and landslide hazards and associated mitigation are discussed in sections 4.1.3.3 and 4.1.4.3.

PM5-7 Additional information and clarifications have been added to section 4.1.

PM5-8 See our response to comment PM2-29. The lower Columbia River has already seen industrial, commercial, and residential development, and the Bradwood Landing terminal property was once the site of a saw mill and town. Also see our response to comment PM5-33.

PM5 RN-110707-FERCpm.txt

PM5-9

19:06:31 15 on such unstable land?

16 A third point is that -- my question is:

17 How can the federal government say that there

18 will be few, if any, toxic fumes from LNG

19 tankers when the tankers and their escort

19:06:50 20 boats, which the DEIS forgot to mention would

21 be running all the time, all of those engines

22 will be running not only during transit up and

23 down the river, but when the LNG tankers are

24 offloading, which takes approximately 24

19:07:06 25 hours -- so three shipments a week up, down,

□

19:07:12 1 and offloading means --

2 MR. FRIEDMAN: Laurie, can you wrap up?

3 MS. LAURIE CAPLAN: Sorry. -- means that

4 almost every day there will be toxic fumes

19:07:20 5 spewing out.

6 The last thing that I want to say is we

7 have been sadly disappointed in the Clatsop

8 County Commissioners because they've been

9 acting like the Clatsop County board of county

19:07:35 10 contortionists. It's been very disappointing.

11 And, unfortunately, despite what you said

12 before about FERC's role, many people have come

13 to believe that "FERC" means Friends to Energy

14 Resource Companies.

19:07:49 15 So I would encourage FERC to take back its

16 role as a regulatory agency and protect all of

17 us from this horrific project. Thank you.

18 MR. FRIEDMAN: Thank you for your

19 comments.

Page 20

Public Meetings

5

PM5-9

Emissions from marine engines powering the escort boats and tugs associated with the project will be regulated by Title II of the Clean Air Act Amendments of 1990, specifically 40 CFR Part 91 and 94 (Control of Emissions From Marine Spark Ignited and Compression Ignition Engines). The EPA, supported by the World Shipping Council, recently proposed to the International Maritime Organization (IMO) more stringent emission limits for ocean going ships, such as LNG carriers. If adopted, the amendments to Annex VI of MARPOL would reduce air pollution from ships by establishing a new tier of performance based standards for marine diesel engines on all vessels. The marine vessels associated with the proposed project would be required to comply with all applicable air quality regulations.

PM5 RN-110707-FERCpm.txt

19:08:00 20 Next, Mike Smith.
 21 MR. MIKE SMITH: My name is Mike Smith,
 22 S-M-I-T-H. I am on the pipeline, and I believe
 23 my mile mark is 21 through 21.058.

PM5-10 24 I am a realtor and a member of Cowlitz

19:08:27 25 County Association -- Cowlitz County

25

19:08:29 1 Association of Realtors. Cowlitz County
 2 Association of Realtors has taken a stand,
 3 along with landowners and Citizens for a Safe
 4 Community, in opposing the pipeline; among
 19:08:40 5 other reasons, the quality of life it affects
 6 on the area.

7 I am here to speak on behalf of myself,
 8 Cowlitz County Association of Realtors, and the
 9 many landowners in the way of the pipeline.

19:08:54 10 After fumbling my way through the DEIS, I found
 11 plenty of places where it refers to property
 12 values and studies -- and the studies seem to
 13 be made by NorthernStar or some associated with
 14 the business, or they say it can't be

19:09:16 15 determined until after the plant is completed.
 16 This is not acceptable.

17 A lot of people have purchased their land
 18 or inherited in the hopes of a good retirement
 19 or to subdivide for our children. With the
 19:09:30 20 pipeline bisecting our land, we have little
 21 chance of that. As a realtor, I have seen
 22 firsthand how hard it is to sell land or
 23 housing with a pipeline in close proximity, and
 24 to subdivide for our children is an impossible

Page 21

Public Meetings

5

PM5-10 Our discussion of potential impacts of the proposed pipeline on property values is included in section 4.8.3.3. The studies we cite on impacts of a pipeline on property values were conducted by Whatcom County, Washington and the INGAA Foundation, not by NorthernStar. Subdividing the land would not be precluded after construction of the pipeline.

Public Meetings

5

PM5 RN-110707-FERCpm.txt

PM5-10
cont'd

19:09:46 25 task, depending on where they put the pipeline. 26
□

19:09:48 1 I have read the DEIS, and this pipeline is
2 going within 50 feet of several homes where
3 people live. Who do you think is going to buy
4 this home if the need to sell occurs? Would
19:10:02 5 you? If the price was right. Huh?

6 In a lot of cases, we are not well-to-do
7 and are depending on our land as a -- as a part
8 of our retirement, whether it is to sell or
9 downsize for our senior years or to subsidize
19:10:23 10 our income -- income. I was told that
11 NorthernStar had planned approximately \$158,000
12 to purchase easements through Cowlitz County.
13 This wouldn't cover the losses of one of the
14 many landowners that are affected.

PM5-11

19:10:37 15 For the promise of a few jobs, we are
16 jeopardizing the lives of many people. The
17 Cowlitz County Association of Realtors will
18 usually support any project that brought new
19 jobs to the area, but with all the negative
19:10:50 20 issues associated with NorthernStar, it is our
21 opinion this is not a place for the pipeline or
22 the regasification plant planned for our area.

23 As you have heard from many others before
24 me, this is not a good thing. And, if
19:11:05 25 anything, it should be close -- put closer to 27
□

19:11:07 1 the end users, Southern California. We are not
2 an LNG acceptable risk. Thank you.

PM5-11 A discussion of jobs is provided in sections 4.8.1.4, 4.8.2.4, and 4.8.3.4. The project would be constructed and operated in accordance with applicable DOT regulations and, therefore, we believe the likelihood of a significant safety event is minimal. A discussion of reliability and safety is provided in section 4.11. Regarding the end users being in Southern California, see our response to comment PM1-23.

Public Meetings

5

PM5-12

3 PMS RN-110707-FERCpm.txt
MR. FRIEDMAN: Thank you for your

4 comments.

19:11:17 5 Next is Jim Townley.

6 MR. JIM TOWNLEY: Mr. Friedman, thank you

7 for the ability to comment this evening. I'm

8 Jim Townley, the executive director of the

9 Columbia River Steamship Operators Association,

19:11:37 10 an 85-year-old, not-for-profit association that

11 was created to represent the interests of

12 deep-sea shipping, the owners, agents that

13 bring the ships to call at ports, including

14 Kalama, Longview, Vancouver; also the deep-sea

19:11:50 15 barges that come to various Oregon coastal

16 ports; and to the inland river system that goes

17 all the way up to Lewiston, Idaho, and operates

18 between Lewiston and Astoria.

19 Our reason for being is to try and keep

19:12:01 20 the ports and the entire river system cost-

21 effective and cost-competitive with other

22 regions around the country, and to do it in a

23 manner that's safe, secure, and environmentally

24 sound. If any new entity comes into the river

19:12:17 25 system, it's looked at by our association

□ 28

19:12:18 1 because our endorsement is sought, and we were

2 quite skeptical about LNG, the initial proposal

3 made about a year and a half ago.

4 Since that time we've worked with the

19:12:30 5 Coast Guard, other state and federal agencies,

6 other partners, stakeholders in the river, the

7 pilots and other people like that that make

PM5-12 Comment noted.

PM5-12 8 PM5 RN-110707-FERCpm.txt
 cont'd 9 their living on the river, and have come to the
 10 conclusion, having participated in the waterway
 11 suitability assessment and the resulting
 12 waterway suitability report, that the
 13 particular project is a positive in all
 14 categories; meaning economically, on balance,
 15 will benefit not just the local region but the
 16 entire river system. The safety and security
 17 of the river system will actually be improved.

PM5-13 17 And the other condition we are looking for
 18 is an improvement and increase in environmental
 19 integrity for the systems that we operate to
 19:13:11 20 prevent, respond, or restore or remediate
 21 should there be an environmental incident,
 22 whether natural or accidental or intentional.
 23 So we didn't come to this conclusion lightly.
 24 We thank you for the opportunity make a
 19:13:23 25 position and to encourage the FERC to go ahead 29

19:13:26 1 and approve the issuance of the required
 2 documents.
 3 Thank you.
 4 MR. FRIEDMAN: Thank you for your
 19:13:32 5 comments.
 6 Paul Amos.
 7 MR. PAUL AMOS: Good evening.
 8 MR. FRIEDMAN: Please make sure to spell
 9 your name for the court reporter.

PM5-14 19:13:55 10 MR. PAUL AMOS: Paul Amos, A-M-O-S. I'm
 11 the President of the Columbia River Pilots. We
 12 board the vessels in Astoria for the bar pilot

Public Meetings

5

PM5-13 Comment noted.

PM5-14 Comment noted.

Public Meetings

5

K-182

PM5-14
cont'd

13 PM5 RN-110707-FERCpm.txt
to bring them across the bar, bringing the
14 ships into to Astoria. We take them the
19:14:06 15 remainder of their voyage to Portland,
16 Vancouver, points east. We will be responsible
17 for navigating the vessels from Astoria to the
18 Bradwood Landing, about 20 miles.
19 My purpose for speaking is to assure FERC
19:14:19 20 that we handle ships of this size routinely.
21 It's not something we're unaccustomed to. We
22 train for regularly, and these ships call on
23 ports on a very regular basis, with a similar
24 draft or deeper drafts as the LNG ships we're
19:14:35 25 talking about.

30

PM5-15

19:14:36 1 We have developed vessel traffic
2 information system the last few years that is
3 considered state of the art and allows us to
4 manage the traffic flow of these ships so they
19:14:43 5 fit nicely in the patterns that exist in the
6 river now. So we don't feel there is going to
7 be any conflict or any problems occurring with
8 ships calling here. Should fit nicely into the
9 process.
19:14:56 10 About, oh, several years ago, our traffic
11 volumes peaked at a little over 2100 arrivals.
12 Last year, 2006, our arrivals were down to
13 1,644. So there's quite a bit of difference
14 there. So you can see that the addition of
19:15:12 15 these ships calling on the river won't begin to
16 fill the gap from our peak period. So the
17 traffic load can be well handled, and the river

Page 25

PM5-15 Comment noted.

PM5-15 18 PM5 RN-110707-FERCpm.txt
 cont'd 19 has historically been handled with no problem.
 19:15:25 20 But we now have the advantage of the more
 21 modern technology of the vessel traffic
 22 information system. This allows us to predict
 23 where we're going to meet vessels along the
 24 route, and as part of the Coast Guard
 requirement for this project, we can only meet
 19:15:36 25 in certain areas. With this technology we can 31
 19:15:39 1 determine exactly where we will meet and make
 2 sure to be in those areas only.
 3 It's a safe -- safe river for this type of
 4 operation, once the improvements have been put
 19:15:49 5 in place the Coast Guard recommended, and if
 6 you have any questions, feel free to contact my
 7 office.
 8 MR. FRIEDMAN: Thank you for your
 9 comments. Next is Marvin King.
 19:16:07 10 MR. MARVIN KING: My name's Marvin King,
 11 K-I-N-G. And I'm speaking against this for
 12 myself and probably a lot of people that don't
 13 even come to these meetings and can't make it
 14 here.
 PM5-16 19:16:17 15 One of my biggest concerns with the LNG
 16 plant is the amount of CO2 that it will put
 17 into the atmosphere every day. In the
 18 processing of the LNG alone, the plant will be
 19 responsible for the release of 192 tons of CO2
 19:16:30 20 daily. CO2 has been identified as the main
 21 cause of global warming, which is melting the
 22 world's glaciers at a record pace. It's ironic

Public Meetings

5

PM5-16 Section 4.10.1 has been updated to include the estimated greenhouse gas emissions resulting from the construction and operation of the project.

PM5-16 23 PM5 RN-110707-FERCpm.txt
 that the CO2 caused from the release of this
 cont'd 24 will some day put this plant under water.
 PM5-17 19:16:46 25 Another big concern is the amount of 32
 □
 19:16:47 1 electricity it takes to make LNG. 24
 2 megawatts, or 20,000 homes' worth of
 3 electricity daily, will definitely make
 4 electricity prices rise as the demand will
 19:16:58 5 increase. In this aspect alone, I do not see
 6 how NorthernStar can condemn many private
 7 citizens' property and run a pipe through it
 8 when ultimately it will be responsible for
 9 making the utility bills of all Northwest homes
 19:17:13 10 higher.
 PM5-18 11 If I'm not mistaken, in the eminent domain
 12 process, NorthernStar must prove that they are
 13 improving life for the public. And they are
 14 definitely not proving that here.
 PM5-19 19:17:26 15 Another huge concern is the climate in the
 16 Northwest. The Northwest has an extremely wet
 17 climate, which is the direct cause of the land
 18 instability and pipe deterioration. There have
 19 been numerous ruptures and explosions already
 19:17:39 20 in the Northwest. It happens even in dry
 21 climates, such as the 30-inch pipe explosion in
 22 Carlsbad, New Mexico, on August 19th, 2000.
 23 This happened to be a very dry climate, but
 24 still the pipe had corrosion which led to a
 19:17:54 25 rupture and the deaths of 12 innocent people. 33
 □
 19:17:57 1 One good question I have: If there is a
 Page 27

Public Meetings

5

- PM5-17 It does not take a lot of electricity to unload, store, or vaporize LNG. In fact, as stated in section 2.1.3.5, the SCVs would operate on natural gas. Actually, the natural gas from the LNG imported by NorthernStar could be used to produce electricity, and may result in lowering of individual utility costs as explained in section 1.1. See our response to comment PM3-6.
- PM5-18 In order to use eminent domain, NorthernStar must have a Certificate issued by the FERC, and be unable to reach an easement agreement with a landowner. The FERC Order issuing a Certificate would include a determination of public convenience and necessity.
- PM5-19 As discussed in section 4.11.9.1, the pipeline must be designed, constructed, operated, and maintained in accordance with the DOT Minimum Federal Safety Standards in 49 CFR Part 192, which include protection from internal, external, and atmospheric corrosion. The unfortunate accident on the El Paso system occurred on an older pipeline that was not "pig-able." NorthernStar's proposed pipeline would be new pipe, welded with modern methods, that could be inspected with a pig.

		PMS RN-110707-FERCpm.txt	
PM5-20	2	rupture and an explosion that causes deaths,	
	3	can the people that voted "yes" be held	
	4	accountable for the deaths since they knew of	
	19:18:08 5	this possibility?	
PM5-21	6	We have so many renewable resources in	
	7	Oregon and Washington that are still untapped.	
	8	FERC should definitely say "no" to this project	
	9	and seek greener, renewable alternatives	
	19:18:23 10	instead of harming the planet for all future	
	11	generations.	
	12	Thank you.	
	13	MR. FRIEDMAN: Thank you for your	
	14	comments.	
	19:18:29 15	Next is Jeff Lovingfoss.	
PM5-22	16	MR. JEFF LOVINGFOSS: My name is Jeff	
	17	Lovingfoss, L-O-V-I-N-G-F-O-S-S. I'm here to	
	18	speak on behalf of Bradwood Landing and	
	19	NorthernStar. Their project will provide over	
	19:19:02 20	\$700,000 in construction costs. 110 million of	
	21	that will be wage and benefits for union	
	22	construction workers, over 2 million hours for	
	23	journeyman level and apprentice construction	
	24	workers in our community.	
PM5-23	19:19:18 25	As our economy grows, Canada's economy	34
	□		
	19:19:22 1	grows, and their need for natural gas increases	
	2	so the amount they will be able to provide us	
	3	with over the years will be reduced. If that	
	4	supply is reduced, costs will increase in this	
	19:19:33 5	area, which will make it hard for our	
	6	industries to compete.	
		Page 28	

Public Meetings

5

- PM5-20 The FERC will approve or deny the project based on an evaluation of the project's merits, including environmental impacts and safety considerations. We address protection of public safety in section 4.11.
- PM5-21 The EIS discusses renewable energy resources as alternatives in section 3.1.1.3.
- PM5-22 Comment noted.
- PM5-23 Comment noted.

PM5 RN-110707-FERCpm.txt

7 Thank you.

8 MR. FRIEDMAN: Thank you for your

9 comments.

19:19:45 10 Next is Darrel Whipple.

11 MR. DARREL WHIPPLE: I'm Darrel Whipple.

12 D-A-R-R-E-L, W-H-I-P-P-L-E. I'm speaking on

13 behalf of Willapa Hills Audubon Society, a

14 public benefit organization of about 225

19:20:10 15 members in Cowlitz and Wahkiakum counties of

16 Washington, and Columbia County, Oregon. The

17 mission of our organization is to support

18 ecologically responsible ways of life, to help

19 maintain biologically diverse habitats, and to

19:20:29 20 promote environmental understanding and

21 enjoyment of nature.

22 My comments are on the turning basin

23 that's proposed. As I understand it, the

24 proposed turning basin section of 2.3.1 is to

19:20:46 25 be excavated in an aquatic conservation unit of

35

19:20:50 1 the estuary, which was so designated by Clatsop

2 County pursuant to the Coastal Zone Management

3 Act and Oregon Land Use Goal 16, estuary and

4 resources. That turning basin is appropriate

19:21:05 5 to development unit, not to a conservation

6 unit, where only minor navigational

7 improvements are sanctioned. It is an

8 unacceptable stretch to characterize this

9 proposed turning basin as a minor navigational

19:21:23 10 improvement.

11 Moreover, the applicant has not

Page 29

Public Meetings

5

PM5-24 On March 20, 2008, the Clatsop County Board of Supervisors made its final decision giving approval to NorthernStar's consolidated application for permits, and changing the land use designation for the proposed maneuvering basin.

PM5 RN-110707-FERCpm.txt

PM5-25

12 demonstrated that the turning basin is
 13 necessary to the operation of the LNG terminal.
 14 If it is true, as I have heard, that there is
 19:21:36 15 sufficient space for an LNG tanker to be turned
 16 around, adjacent to the dock at Bradwood, then
 17 the only reason to excavate nearby in the
 18 conservation unit would be to lay claim to a
 19 bounteous supply of cheap sand for building up
 19:21:52 20 of the plant site to design specifications.

21 Then what a few years hence? Abandon the
 22 turning basin and avoid the nuisance and
 23 expense of maintaining it? What sort of
 24 guarantee does the applicant make that the
 19:22:07 25 turning basin is so essential to the operation

36

19:22:09 1 of the terminal that the company will be using
 2 it throughout the life of the plant? If the
 3 turning basin is just an excuse to tap a nearby
 4 source of sand at the expense of the structure
 19:22:22 5 and biology of a protected portion of the
 6 estuary, then the applicant has perpetrated a
 7 deception and should be granted no permits for
 8 this project.

PM5-26

9 My final comment generally about the DEIS,
 19:22:40 10 we have noticed several sections where there
 11 are incomplete portions. They may need to be
 12 submitted or actually written, and if there are
 13 such added portions to the DEIS, we believe
 14 that public comments on those portions should
 19:23:06 15 be allowed.

16 Thank you.

Page 30

Public Meetings

5

PM5-25 Only about half of the 700,000 cubic yards of sand is needed to raise the grade at the LNG terminal site to the design specifications. The remaining sand must be removed to construct the maneuvering basin for the LNG carriers.

PM5-26 See our response to comment PM1-26.

PMS RN-110707-FERCpm.txt

17 MR. FRIEDMAN: Thank you for your
18 comments.

19 Next, if I mispronounce your last name,
19:23:19 20 please correct me. Brett VandenHeuvel.

21 MR. BRETT VANDENHEUVEL: That's Brett
22 VandenHeuvel. I'm the staff attorney for
23 Columbia Riverkeeper.

24 MR. FRIEDMAN: Brett, would you spell your
19:23:33 25 last name.

37

19:23:33 1 MR. BRETT VANDENHEUVEL: Sorry.
2 V-A-N-D-E-N-H-E-U-V-E-L.

PM5-27

3 Columbia Riverkeeper is an conservation
4 organization with over 1500 members. We're
19:23:46 5 also a part of the Lower Columbia Clean Energy
6 Coalition, which is a coalition of groups
7 including business groups, property rights
8 organizations, environmental groups that have
9 all joined together in an unprecedented joining
19:24:02 10 of groups of these types to oppose Bradwood as
11 an LNG terminal.

12 And a lot of us in this area have got a
13 big education analogy in the last three or four
14 years looking at Bradwood and looking at some
19:24:16 15 of the other sites, and there's a lot of
16 pessimism about FERC. People think FERC has
17 failed us on this. They've looked at the EIS,
18 which I have read, and I know a lot of people
19 in this room have read in detail. They think
19:24:29 20 it has been a failure, has a lot of holes in
21 it, includes a lot of misstatements,
Page 31

Public Meetings

5

PM5-27 The Commission did not authorize the KeySpan LNG Project in Rhode Island (CP04-223 et al.). Impacts on salmon habitat from dredging the turning basin at the Bradwood Landing Project, and mitigation of those impacts are discussed in sections 4.3.2, 4.5, and 4.6.

Public Meetings

5

PM5-27
cont'd

PMS RN-110707-FERCpm.txt

22 misinformation that has been fed by
23 NorthernStar.
24 At this stage I still see some hope for
19:24:42 25 FERC in this process, some hope that FERC is 38
□

19:24:44 1 going to make the right decision right here.
2 I've been laughed at when I've said that; that
3 FERC has never rejected an LNG terminal, no
4 matter how bad it is, and that's true as far as
19:24:54 5 I understand.
6 MR. FRIEDMAN: No, it's not true.
7 MR. BRETT VANDENHEUVEL: Okay. What's
8 the --
9 MR. FRIEDMAN: There was a project in
19:25:00 10 Providence. Right? Yeah, there was an
11 application rejected in the Northeast.
12 MR. BRETT VANDENHEUVEL: The (inaudible)
13 in Providence?
14 MR. FRIEDMAN: No. I'm not sure exactly
19:25:10 15 where it was. It was the --
16 UNIDENTIFIED SPEAKER: KeySpan.
17 MR. FRIEDMAN: Yes, the KeySpan proposal.
18 MR. BRETT VANDENHEUVEL: I stand
19 corrected. Thank you.
19:25:21 20 UNIDENTIFIED SPEAKER: It was not a new
21 one.
22 MR. BRETT VANDENHEUVEL: So, other than
23 one out of many -- but I still have hope
24 because this one is an absolute no-brainer.
19:25:32 25 From all the other terminals that we've looked 39
□

PM5 RN-110707-FERCpm.txt

PM5-27 cont'd 19:25:34 1 at, there is nothing nearly as egregious as
2 approving this. People have talked about

PM5-28 3 ecologically the problems. Here it would be
4 dredging 58 acres of prime salmon habitat.
19:25:47 5 The United States, private individuals,
6 our organization have all spent hundreds and
7 hundreds of hours of time, millions of dollars
8 trying to restore this economically vital
9 salmon run, only to be degraded for the profit
19:26:02 10 of a private corporation. They hide from us
11 how it's going to be destroying salmon habitat;
PM5-29 12 filling 14 acres of wetland; a pipeline
13 crossing over -- the Palomar pipeline would
14 cross over over 70 water bodies in Oregon and
PM5-30 19:26:19 15 Washington. The proposed NorthernStar pipeline
16 would cross all the way across Cowlitz County,
17 ruining many water bodies, even if it's
18 horizontally directionally drilled.

PM5-31 19 Economically, there's great potential to
19:26:30 20 disrupt river traffic. The Cowlitz County
21 Association of Realtors, I find that very
22 interesting that they're opposing this project
23 because usually anything that brings jobs they
PM5-32 24 approve. Global warming was mentioned earlier.
19:26:43 25 LNG is not the same as domestic natural gas. 40
□

19:26:47 1 Two different studies have shown that it's
2 either 30 or 40 percent -- emits 30 or 40
3 percent more greenhouse gases than domestic
4 natural gas.

Page 33

Public Meetings

5

- PM5-28 Past and current efforts to restore the Columbia River estuary are summarized in section 4.12.3. In addition, these efforts along with a detailed analysis of the project's effect on salmon habitat will be described in the revised BA and EFH Assessment.
- PM5-29 The Palomar pipeline is being evaluated under a separate EIS.
- PM5-30 As described in section 4.3, with the mitigation measures proposed and the use of HDD, impacts on waterbodies would be minor and temporary during pipeline construction.
- PM5-31 We do not believe that the project has great potential to disrupt other river traffic. See the discussion in sections 4.8.1.7 and 4.8.1.8
- PM5-32 Section 4.10.1 has been updated to include the estimated CO₂ emissions resulting from the construction and operation of the project. The end use of the natural gas that would be brought in through the proposed Bradwood Landing Project is outside the scope of the project and, consequently, is outside the scope of the EIS.

PM5-33 19:26:57 5 PM5 RN-110707-FERCpm.txt
And eminent domain was mentioned earlier.

6 It seems to be FERC's policy and the policy of
7 the United States government that whoever gets
8 their application in first is going to be
9 approved first. Everyone agrees that there's
19:27:12 10 not going to be very many of these LNG
11 terminals approved, so it's a race to get that
12 done first. That's very unwise energy policy.
13 FERC should look closely at the wisdom of the
14 location and the need for the gas and not just
19:27:27 15 approve whoever comes in the door first.

PM5-34 16 Lastly, on this -- lastly, safety.
17 NorthernStar is an energy speculator, funded by
18 investors out of New York. They're not a
19 reputable company. They've never built
19:27:40 20 anything. They've never built a gas station.
21 Dr. Jerry Havens, who's going to -- this is for
22 folks in the audience, too. Dr. Jerry Havens,
23 who is an expert on LNG safety, is in Oregon
24 this week, and he's going to present testimony
19:27:56 25 to you tomorrow night in Knappa. So I

19:27:58 1 encourage everyone to go out and see him.
2 I had the good fortune of meeting with him
3 today and some representatives of Oregon and
4 the federal government, and he wrote the model
19:28:08 5 that's used in 49 CFR 123 that FERC applies,
6 and in the EIS he flew all the way to Oregon to
7 tell you -- and I'm going to give you a little
PM5-35 8 precursor to tonight -- that NorthernStar and
9 FERC applied his model incorrectly and that

Page 34

Public Meetings

5

PM5-33 The Commission's policy is to ensure that all proposed projects are environmentally sound and consistent with public safety, and then leave it to the market to determine which projects are constructed. To protect the environment and ensure safety, each individual project must be evaluated on the basis of its site-specific impacts. We therefore review applications for gas projects as they are filed, based on their individual merits.

PM5-34 NorthernStar would be required to construct and operate its project in accordance with applicable DOT regulations regardless of its corporate structure and, therefore, we believe the likelihood of a significant safety event is minimal. A discussion of reliability and safety is provided in section 4.11.

PM5-35 See our responses to Dr. Jerry Havens' comments, IND73-1 through IND73-5.

Public Meetings

5

PM5-35
cont'd

19:28:22 10 PMS RN-110707-FERCpm.txt
they vastly underestimated the safety
11 consequences of the vapor cloud dispersion
12 model.
13 In simple English, they say that a vapor
14 cloud fire is going to be much smaller than it
19:28:34 15 actually would be. So this is a very high-
16 consequence event. Granted, everyone agrees
17 it's low risk, but the consequence of this must
18 be analyzed, not only for the terminal itself,
19 but for the city of Astoria and the other
19:28:48 20 organizations --
21 MR. FRIEDMAN: Wrap it up.
22 MR. BRETT VANDENHEUVEL: -- and the other
23 population centers that it passes along the
24 route, including right across the river the
19:28:55 25 population center on Puget Island.

□ 42

19:28:58 1 So those are what quickly what we consider
2 to be the very negative aspects of this
3 proposal. As I said, I think it's a
4 no-brainer. I have hope that FERC can stand
19:29:11 5 strong and reject this application.
6 Thank you.
7 MR. FRIEDMAN: Thank you for your
8 comments.
9 We're going to guess on this. It's hard
19:29:42 10 reading the writing. Marcie Denison? Your
11 turn to speak. And if you could spell your
12 last name for the court reporter.
13 MS. MARCIA DENISON: I'm Marcia Denison.
14 MR. FRIEDMAN: If you can push the

Page 35

PM5 RN-110707-FERCpm.txt
 19:30:01 15 microphone down a bit. He was really tall.
 16 MS. MARCIA DENISON: Marcia Denison,
 17 Pacific Rainforest Guardians. Just a second.
 18 MR. FRIEDMAN: Can you spell your last
 19 name for the court reporter, please.
 19:30:20 20 MS. MARCIA DENISON: D-E-N-I-S-O-N.
 21 MR. FRIEDMAN: Thank you.
 PM5-36 22 MS. MARCIA DENISON: I can't get past the
 23 part where a branch of our military would be
 24 commandeered and they would -- could possibly
 19:30:35 25 kill anybody that's in their way. I mean, that
 □ 43
 19:30:37 1 part -- you know, I kind of stumble over that
 2 one from the beginning, you know. But also
 3 their lack of concern for anybody else with
 4 something that dangerous. They shouldn't even
 19:30:52 5 have a license to operate. When you got
 6 something really dangerous, you got to be
 7 really concerned about people around you. They
 8 won't even set the gas to prevent a disaster
 9 from happening. They don't care.
 19:31:09 10 My handwriting is terrible, isn't it?
 11 Okay.
 12 LNG ships are not allowed in California,
 13 and they must not be allowed in Oregon because
 14 they are too dangerous. I mean, you know, this
 19:31:23 15 is just plain as the nose on your face, isn't
 16 it?
 17 NorthStar must not be allowed to risk
 18 burning our forests and killing our wildlife in
 19 case of an accident. If they don't care enough

Public Meetings

5

PM5-36 Safety and security issues are addressed in section 4.11.

PM5-36 19:31:42 20 PM5 RN-110707-FERCpm.txt
 to set the gas, you know there's a good
 cont'd 21 likelihood of an accident happening.
 PM5-37 22 Okay. They don't care if they suck up all
 23 the young salmon into their bilge water. They
 24 don't even bother to put a screen on the intake
 19:32:01 25 of the bilge pump. They take the salmon and
 □ 44

19:32:07 1 dump them off in Indonesia. What's that for
 2 the environment? Is that good for the
 3 environment? No. They get a big "F" for EIS.
 4 Okay?

19:32:18 5 I'm struggling on this. Okay.

PM5-38 6 The air is so bad already. In Longview
 7 and Rainier area, all that crap drifts across
 8 the river. I can't even see the hill four
 9 blocks away when -- there's too many
 19:32:34 10 smokestacks now. The lower Columbia industrial
 11 area is ignored by the EPA. They don't monitor
 12 all this horrible pollution that we have from
 13 all these smokestacks. They just turn their
 14 back on it because it's not up around Seattle
 19:32:50 15 someplace.

16 And there's a very, very high rate of lung
 17 cancer and other lung diseases here, and we
 18 don't need any more smokestacks. All that is
 19 is going to fuel a whole bunch more smokestacks
 19:33:01 20 and kill people, and we don't want it. It's
 21 bad. It's frustrating not being able to get
 22 the government authorities to do something
 23 about it, too.

24 Okay. Oh, man. Okay. We need the air

Page 37

Public Meetings

5

PM5-37 See our response to comment FA1-28.

PM5-38 As documented in section 4.10.1 of the EIS, the Bradwood Landing project would comply with applicable air quality regulations that have been established by federal and state agencies to be protective of the public and the environment, in order to minimize impacts of air pollution generated from the project.

PM5-38 19:33:21 25 PM5 RN-110707-FERCpm.txt
 cleaned up in the lower Columbia industrial 45
 cont'd

19:33:24 1 area. We don't need more plants, and don't
 2 make it worse, please. And I think that's all
 3 I had to say. Let's see.
 4 Oh, yeah. We want wind and wave power.

19:33:36 5 We don't want any more smog and carbon dioxide.
 6 The global warming is -- is shocking now. I
 7 mean, it's time to slam on the brakes. A good
 8 place to start. Thank you.

9 MR. FRIEDMAN: Thank you for your
 19:33:50 10 comments.
 11 Again, correct me if I mispronounce your
 12 name, John Koehler. And, John, please make
 13 sure you spell your last name for the court
 14 reporter.

19:34:12 15 MR. JOHN KOEHLER: You got the
 16 pronunciation correct. K-O-E-H-L-E-R. I am,
 17 as far as I know, not on the pipeline. At
 18 least I hope I'm not.

PM5-39 19 A few things I'd like to mention right
 19:34:27 20 now. They're really in the form of questions
 21 for your final draft, to address, not comments
 22 as your preliminaries said. The question
 23 that's already been brought up about the
 24 question of safety I think is one that's very,
 19:34:43 25 very important. Yes, the chances are very low. 46
 19:34:49 1 At least we most certainly all hope they're
 2 low. However, the chance was very low for
 3 Three Mile Island, for Chernobyl.
 Page 38

Public Meetings

5

PM5-39 The FERC does not choose the locations for proposed LNG terminals. The location is chosen by the applicant and the FERC determines if the location meets the applicable safety standards. See section 4.11.

		PM5 RN-110707-FERCpm.txt	
PM5-39	4	You locate things that are very, very	
cont'd	19:34:59 5	dangerous in places that make sense. You don't	
	6	locate a nuclear power plant at the head of a	
	7	waterway that will pollute all the waterways if	
	8	something happens. You don't plant places at	
	9	the top of a windy mountain so that if you have	
	19:35:15 10	a meltdown, you have that wind spreading things	
	11	all over the place. You don't put it in the	
	12	middle of a large population base.	
	13	I hope that when you're doing your safety	
	14	consideration, you're not only looking at the	
	19:35:29 15	possibility of danger, of an accident and the	
	16	impact, but the location. Is this really a	
	17	safe place to put it? Is it really an	
	18	appropriate place to put it? You're talking	
	19	about the largest river in the United States,	
	19:35:45 20	one that has tremendous tidal flow and current	
	21	flow through there.	
	22	Any kind of an act that's going to carry	
	23	that liquid natural gas a long distance very,	
	24	very quickly, is not going to be a	
	19:35:59 25	lackadaisical situation, where you have plenty	
	□	47	
	19:36:02 1	of time to respond. It's going to spread	
	2	itself very rapidly to a very wide area. So I	
	3	hope those are issues that you're looking at	
	4	very carefully.	
PM5-40	19:36:12 5	Secondly, the reason that I don't believe	
	6	that I'm on the gas line is because they were	
	7	intending to come up in the middle of my	
	8	property, and they discovered when they did	
		Page 39	

Public Meetings

5

PM5-50 See our response to comment PM3-60.

		PMS RN-110707-FERCpm.txt	
PM5-40	9	some studies -- this is secondhand, but my	
cont'd	19:36:25 10	understanding -- I purchased the property a	
	11	year and a half ago, and in talking with the	
	12	people I purchased the property from, my	
	13	understanding was is that they decided that my	
	14	property was not adequate because of severe	
	19:36:39 15	slide dangers.	
	16	They've moved the location where they are	
	17	intending to bring it up, I believe, about a	
	18	quarter of a mile into my neighbor's yard. I	
	19	hope that you are doing appropriate studies and	
	19:36:54 20	looking at very carefully to make sure that	
	21	that short distance of travel is enough that	
	22	the threat of landslides really has been	
	23	eliminated. So, you know, it's -- I'll leave	
	24	it at that.	
PM5-41	19:37:14 25	The third issue I'd like to question, ask	48
	19:37:17 1	a question about, is we already have in	
	2	Washington a natural gas line that goes right	
	3	through that area. Why, if we're going to use	
	4	eminent domain to put in an additional gas	
	19:37:31 5	line, would we not put it in the exact same	
	6	route?	
	7	It seems to me that if you're talking	
	8	about minimizing environmental impact, the best	
	9	way to possibly reduce the impact of natural	
	19:37:47 10	gas lines is to lay two of them side by side,	
	11	space them apart whatever distance is	
	12	appropriate to make sure that there's no	
	13	accidental breakage of one line while you're	
		Page 40	

Public Meetings

5

PM5-41 See our response to comment SA3-7. The proposed Bradwood Landing Pipeline is adjacent to the existing KB pipeline for as much of its length as possible for about 8 miles between MPs 19.4 and 36.3 in Cowlitz County, Washington. It deviates away from the KB pipeline in places to reduce geological hazards, waterbody crossing impacts, or residential conflicts.

PM5-41
cont'd

PMS RN-110707-FERCpm.txt

14 working on the second line, and run the line
15 exactly the same spot. It seems to me that you
16 can't make smaller environmental imprint than
17 doing that rather than running a second gas
18 line that's separated in some cases completely
19 encircled property, making the values very,
19:38:21 20 very low. And that's it.
21 MR. FRIEDMAN: Thank you, John.
22 Vonda Kay Brock.
23 MS. VONDA KAY BROCK: Good evening. I'm
24 hoping that you will not --
19:38:44 25 MR. FRIEDMAN: Please spell your name.
□ 49

19:38:46 1 SPEAKER: My name is Vonda Kay Brock.
2 Last name is B-R-O-C-K. I live out of
3 Longview, up in the hills, a place called
4 Stella. And I'm hoping that I can get
19:38:58 5 everything said that I need to say in my three
6 minutes time.
7 MR. FRIEDMAN: And if not, you can send in
8 detailed written comments to the commission.
9 MS. VONDA KAY BROCK: Right. I understand
19:39:05 10 that. But I have just this little small thing,
11 but I don't read very well tonight. I'm having
12 a little difficulty. So I hope you'll just
13 bear with me and let me get my statement said.
14 Thank you. Thanks.
19:39:26 15 First of all, I've heard some very
16 interesting comments here tonight, and I think
17 that some of those comments are very
18 far-reaching, and FERC is an organization that
Page 41

Public Meetings

PM5 RN-110707-FERCpm.txt

PM5-42 19 needs to also be far-reaching. You need to be
 19:39:41 20 thinking ahead rather than at the moment. And,
 21 therefore, some of these statements that have
 22 been made in regard to the DEIS should be
 23 considered very carefully, because you can't
 24 judge whether -- that's one of the issues that
 19:40:02 25 we have here in the Pacific Northwest, is a lot
 □ 50

19:40:04 1 of hydrology, a lot of geology, and a lot of
 2 both of them getting mixed together, which
 3 means that we have slippery slopes all over the
 4 place. And Washington is number two in the
 19:40:17 5 nation as far as frequencies of earthquakes,
 6 also.

PM5-43 7 However, what I have to say is something
 8 about the fact that this DEIS thing is a
 9 redundancy. Shouldn't even -- you shouldn't
 19:40:29 10 have to be here. You shouldn't have to be here
 11 tonight listening to us. And the reason you
 12 shouldn't have to be here is because FERC
 13 already had a good plan, and I want to tell you
 14 a story about that plan.

19:40:45 15 I have right here statements published in
 16 December of 2003 by FERC. The title of this
 17 statement is California Natural Gas Market
 18 Outlook. And a statement of interest that I
 19 quote in that is: Planned gas-fired electric
 19:41:02 20 plant in the West for the period 2003 to 2006
 21 will be located along the major interstate
 22 national -- natural gas pipelines and along the
 23 intrastate natural gas pipelines in California.
 Page 42

Public Meetings

5

PM5-42 Geological hazards are addressed in section 4.1 of the EIS. Also see our responses to comments SA1-4 and LA7-25.

PM5-43 See response to comment PM1-23.

PM5-43

cont'd

PM5 RN-110707-FERCpm.txt

24 Another FERC statement from that same
 19:41:17 25 paper says: Between 2006 and 2009,
 □
 19:41:22 1 approximately 8.65 billion cubic feet per day
 2 of natural gas may be available to California
 3 from potential LNG import terminals to be
 4 located in California and Baja California, but
 19:41:38 5 then the wars began. California doesn't want
 6 LNG. The people don't want LNG. I have a map
 7 here that has 21 locations on it that have been
 8 either stopped completely or they're stranded,
 9 because the LNG facilities can't go any further
 19:41:58 10 right now.
 11 The wars have started. California --
 12 here's a map showing 21 California/Baja
 13 California LNG projects put on hold or
 14 discontinued. No LNG. World War III developed
 19:42:17 15 between Conoco Phillips, Marathon, Chevron,
 16 Texaco, Sempra, and Shell to gain the permit
 17 for Baja California LNG. I'm sure you're all
 18 familiar with that. Sempra and Shell joined
 19 forces, and they won that war. And that's what
 19:42:33 20 we mean when we say first come, first serve
 21 with FERC. First come, first serve. The first
 22 one on the block is the one who gets the apple.
 23 Sempra has since dedicated \$11 billion to
 24 develop their West Coast infrastructure.
 19:42:47 25 Sempra experienced a huge blow when their
 □
 19:42:51 1 Frontier Line coal-fired electric generator

5

PM5-43
cont'd

2 PMS RN-110707-FERCpm.txt
plant and their sunrise link coal-fired
3 electric generator plant and subsequent
4 interstate transmission lines failed.

19:43:03 5 MR. FRIEDMAN: Ms. Brock, can you wrap it
6 up?
7 MS. VONDA KAY BROCK: After those defeats
8 and the loss of the Frontier Line campaign,
9 California energy czar Joseph F. Desmond --
19:43:12 10 Sempra switched gears and concentrated on LNG
11 gas-fired generators. They are now working to
12 achieve that end, and Joseph Desmond is still a
13 familiar name in that same pursuit. Joseph
14 Desmond championed Sempra's Frontier Line and
19:43:29 15 now champions NorthernStar's Bradwood Landing
16 as senior vice president of external affairs.
17 The gas and oil exploration by the name of
18 Venoco owns Grace Oil Platform that
19 NorthernStar has contracted to purchase for an
19:43:42 20 offshore LNG terminal in California. Venoco
21 now has plans to explore for natural gas in
22 this region and is aware of previous
23 explorations which discovered potential natural
24 gas storage chambers in the region. Sempra has
19:43:53 25 no storage chambers in their territories. 53
□

19:43:56 1 Sempra's chairman of finance is on the board of
2 directors of Venoco. Now comes Northwest --
3 MR. FRIEDMAN: Please wrap it up and you
4 can send in details.
19:44:06 5 MS. VONDA KAY BROCK: I will take one more
6 minute.

PM5-43

cont'd

7 PMS RN-110707-FERCpm.txt
 -- a partner with NorthernStar and

8 TransCanada, Palomar natural gas pipeline

9 project. It turns out that a Mr. Henry Morse,

10 president and former CEO of TransCanada, is the

11 general manager of the North Baja California

12 pipeline, Semptra's LNG hook-up, and is also the

13 project manager for the Palomar project, which

14 will mesh with Bradwood Landing and intends to

15 accommodate the Midwestern and Southwest

16 natural gas markets.

17 Now, the last quote from your FERC people.

18 Another FERC 2003 quote: In 2011, increased

19 pipeline capacity in the West is projected to

20 serve the Midwest, primarily, and California to

21 a lesser extent.

22 We don't need this pipeline coming through

23 Washington because it isn't for us. It isn't

24 for us at all. Now, it's about big government,

19:44:56 25 it's about big money, and it's not about Oregon

19:44:59 1 and Washington, who want to stay green, who

2 want to stay clean, and who want to step

3 forward quickly on renewable energy resources.

4 We don't need plan B. Thank you.

19:45:09 5 MR. FRIEDMAN: Thank you for your

6 comments. And if you have detailed comments,

7 please mail them to us.

8 Nancy Munk Christie.

9 MS. NANCY MUNK CHRISTIE: My name is Nancy

19:45:31 10 Munk Christie. My last name is

11 C-H-R-I-S-T-I-E. I'm here on behalf of myself

Public Meetings

Public Meetings

5

PM5 RN-110707-FERCpm.txt
 12 and also my mother, Audrey Munk, who has sent
 13 you her own comments already. Her home, in
 14 which three generations of our family have
 15 lived, has been described as at ground zero for
 16 this pipeline. She's been -- she's 86 years
 17 old. She's been in this home since she was a
 18 child. She would -- her family was there
 19 before that. It's at mile marker 34, and I
 19:46:08 20 also live at that residence.

PM5-44

21 If I were not opposed to this for the
 22 personal reasons that it's going to destroy our
 23 family home, I would be opposed to it for many
 24 other reasons. First, around our location,
 19:46:25 25 which is on 40 hilly acres, the ground is

55

19:46:29 1 extremely unstable. Every year for the last
 2 six years I've had to spend a substantial
 3 amount of my time helping clean up from a
 4 full-size fir tree that has fallen or has had
 19:46:44 5 to be cut from disease or age.

6 The area where this pipeline is going to
 7 go through has many, many full-size fir trees
 8 around it. I often worry that one of them is
 9 going to fall on our house. I greatly fear

19:46:58 10 what would happen if one of them fell across
 11 this pipeline. So I'm wondering, would they
 12 cut every tree, you know, within miles of it so
 13 they wouldn't fall down? These are very big
 14 trees.

PM5-45

19:47:12 15 If I were not opposed to it, again, for
 16 personal reasons, I would still be opposed to

Page 46

PM5-44 See our response to comment PM3-6. Section 4.4.2 discusses potential project impacts on forest. The pipeline would be installed underground, and therefore would not be affected by falling trees. Section 4.4.2.3 describes how the permanent right-of-way would be maintained in areas of upland vegetation, including forested areas.

PM5-45 No one would lose their property because of this project. Along the pipeline, NorthernStar would have a 50-foot-wide utility easement, but the land would still belong to the original owner. The project is located in a rural area, and would therefore affect fewer people than if it were located in a densely populated urban center. The location of the LNG terminal was chosen, in part, because it was a previously existing industrial facility accessible to LNG carriers. The portion of the pipeline route in Washington was chosen largely because it is collocated for a majority of its length with the existing KB pipeline, which would minimize the potential for environmental impacts. Impacts on salmon are addressed in sections 4.5 and 4.6; CO₂ emissions are addressed in section 4.10; and environmental justice is addressed in section 4.8.

PM5-45

cont'd

17 PM5 RN-110707-FERCpm.txt
it for the larger reasons, for the reasons
18 others have mentioned: For the salmon spawning
19 ground problems, for the CO2 emissions, for all
19:47:25 20 the other people who may lose their property.
21 But I am especially enraged over what I would
22 call environmental justice.
23 Whenever a company like NorthernStar and
24 the others who have filed for permits have a
19:47:40 25 very questionable and nasty environmental
□

56

19:47:43 1 project that they can't seem to manage to site
2 in a large-population area which it's
3 ultimately going to benefit, they try to run it
4 through a rural area, more sparsely populated,
19:47:54 5 where they think perhaps people will jump at
6 the jobs and the chance for industry. And I'm
7 just really enraged that they think that this
8 area where I grew up is -- falls into that
9 category.

19:48:10 10 I think you can see by the comments of the
11 people around here tonight that this is an
12 activist, educated population who are not going
13 to let this issue drop. And if they think this
14 is -- this is a place where they can put this
19:48:26 15 pipeline because people are so desperate for
16 it, they have another thing coming.

PM5-46

17 The few extra jobs, the extra initial
18 possible boost to the economy, I think, is
19 shortsighted. I think in the long term this
19:48:40 20 will be a disaster for this area. Even the
21 larger area, the other ports -- Portland,

Page 47

Public Meetings

5

PM5-46 Based on our discussion in sections 4.8.1.7 and 4.8.1.8, we believe the project would not have any significant impacts on shipping or on other users of the Columbia River.

PM5-46 22 PMS RN-110707-FERCpm.txt
 cont'd 23 Kalama -- it will be terrible. It will damage
 24 all the other shipping to the exclusion of the
 19:48:57 25 LNG, and I really do not want to see this
 happen in my home.

57

19:48:58 1 Thank you.
 2 MR. FRIEDMAN: Thank you for your
 3 comments.
 4 Next is -- please correct me when I
 19:49:06 5 mispronounce your names. Leslie Hildula.
 6 MS. LESLIE HILDULA: Yes.
 7 MR. FRIEDMAN: And don't forget to spell
 8 your name for the court reporter.
 9 MS. LESLIE HILDULA: Leslie Hildula.

19:49:18 10 H-I-L-D-U-L-A.
 PM5-47 11 I have a farm in Clatskanie. It looks
 12 like is a possibility that the pipeline will go
 13 through our farm, and the farm has been in our
 14 family since the '30s, and so that's probably
 19:49:32 15 my initial objection to it. It doesn't seem
 16 like the best use of the land or of the river
 17 of this area. When healthy, this land and the
 18 river has the potential to support a lot of
 19 jobs, create a lot of food, and it's not what I
 19:49:48 20 consider the best and highest use of the land
 21 or the river.

PM5-48 22 Second of all, the point that other people
 23 have made is that California rejected it
 24 because of concerns. They are the primary
 19:50:02 25 customer; then why should we be so foolish as

58

Public Meetings

5

PM5-47 As discussed in section 4.4.2.3, agricultural land would be allowed to revert to its previous use after construction of the proposed pipeline. Therefore, we do not believe that this project would reduce the potential for the region to produce food. Nor should the project have a negative impact on other river users (see our response to comment PM5-46). Local land use is discussed in section 4.7.

PM5-48 See our response to comment PM1-23.

PM5 RN-110707-FERCpm.txt

19:50:05 1 to allow it?

PM5-49 2 Three, the other issue that concerns me,
3 it seems that we're putting -- we have a lot of
4 difficulty, including fighting wars, with
19:50:13 5 foreign energy, and it doesn't seem like the
6 best use of our government resources or even of
7 our nation's resources to be spending time
8 developing an energy source that is not
9 domestic.

PM5-50 19:50:22 10 And my final point gets into wanting to
11 support renewable sources of energy. I'd be
12 willing to pay more taxes. I drive vehicles
13 that use biofuels, and I would love to have
14 subsidies for domestic renewable sources of
19:50:39 15 energy and to put our efforts there instead of
16 into an LNG facility that has such potential to
17 hurt our land and our river.
18 And I also want to say thank you for being
19 here. I appreciate the opportunity to come
19:50:53 20 here tonight, the fact that you held some more
21 public input meetings, and that you're taking
22 the time to take our testimony.
23 MR. FRIEDMAN: Thank you for your
24 comments.

19:51:07 25 Now I've reached the time where people
□

19:51:09 1 would be talking who have previously spoken at
2 other meetings. So before I give them that
3 opportunity, I want to know if there's anyone
4 else who has not signed up who wishes to speak,
19:51:17 5 who did not speak at an earlier meeting. If
Page 49

59

Public Meetings

5

PM5-49 As section 1.1 briefly explained, the purpose of the project is to provide another source of natural gas, by importing LNG from countries with large reserves, to supplement domestic supplies.

PM5-50 See our response to comment PM5-21.

PMS RN-110707-FERCpm.txt

6 you do, please raise your hand.

7 MS. MELISSA WILKIE: I haven't spoken.

8 MR. FRIEDMAN: All right. And you'd like

9 to speak? Come on up, please, to the

19:51:27 10 microphone and have an opportunity. Just

11 remember to state your name for the record and

12 spell your last name.

13 MS. MELISSA WILKIE: Hi. Thanks for being

14 here tonight. My name is Melissa Wilkie,

19:51:41 15 W-I-L-K-I-E. I live west of Longview near the

16 site where the pipeline's coming through.

PM5-51 17 I'm here this evening to address the lack

18 of concern on the part of NorthernStar and our

19 federal government when it comes to the safety

19:51:54 20 of the citizens who will live along the

21 pipeline corridor. In the DEIS, pipeline

22 safety is basically mentioned in only regard to

23 laws and the Pipeline Safety Act of 1968. In

24 fact, the term "pipeline emergency" is only

19:52:08 25 mentioned once.

□

60

19:52:09 1 Beginning on page 4-440, part 192 of the

2 law explains area classifications are based on

3 population density in the vicinity of the

4 pipeline, with "vicinity" defined as 220 yards

19:52:22 5 on either side of the pipeline along one

6 continuous mile of pipeline. Areas are divided

7 into classes, depending on the number of

8 buildings. Most of the pipeline route is

9 designated class one and class two, for a total

19:52:37 10 of 33.3 miles.

Page 50

Public Meetings

5

PM5-51 NorthernStar would be required to construct its pipeline in accordance with the safety regulations in the DOT's Minimum Federal Safety Standards in 49 CFR Part 192 regardless of Class location.

		PM5 RN-110707-FERCpm.txt	
PM5-51	11	No homes within that distance are	
cont'd	12	considered HCAs, or high consequence areas,	
	13	meaning our federal government considers those	
	14	living in the class one and two areas	
	19:52:50 15	acceptable risks in case of a pipeline failure.	
PM5-52	16	Additionally, on page 4-442 it is clearly	
	17	stated no additional specialized local fire	
	18	protection would be required to handle pipeline	
PM5-53	19	emergencies. Southwest Washington is an area	
	19:53:05 20	where three pipeline explosions have happened	
	21	in the last 20 years, with two of those events	
	22	happening in Cowlitz County, all due to	
	23	ground-shift issues, each within short miles of	
	24	this proposed pipeline.	
	19:53:19 25	Section 4.11.9.2, pages 4-442 to 4-444,	61
	19:53:26 1	pipeline accident data, absolutely no mention	
	2	of William Northwest pipeline issues, multiple	
	3	leaks and explosions resulting in the emergency	
	4	shutdown of the 24-inch line and transfer of	
	19:53:40 5	capacity to the parallel 30-inch line.	
	6	How many people in this room were even	
	7	aware the smaller Williams line running through	
	8	Cowlitz County had been abandoned because	
	9	repairs were too costly? There is no need for	
	19:53:53 10	the additional capacity. The remaining	
	11	operational 30-inch line was exposed during	
	12	heavy rains last winter and floated into the	
	13	Toutle River.	
	14	Section 4.11.3 on page 4-444, impact on	
	19:54:09 15	public safety. When national figures are used	
		Page 51	

Public Meetings

5

- PM5-52 Section 4.11.9.1 states that NorthernStar would provide appropriate training to emergency services personnel but no additional specialized fire protection equipment would be required for the pipeline. The equipment used by typical fire departments is appropriate to respond to natural gas incidents.
- PM5-53 See our response to comment PM2-16.

Public Meetings

5

PM5 RN-110707-FERCpm.txt

PM5-53
cont'd

16 in support of the regional issue, at best those
17 figures should be considered skewed. Regional
18 topography, climate, seismic activity, winds,
19 et cetera, create issues specific to a region.

19:54:24 20 What happens in southwest Washington is not the
21 same as what happens in the high-plains area of
22 central and eastern Washington.

23 Therefore, using a figure of potentially
24 -- of potential fatality every 2,752 years is
19:54:42 25 ludicrous. Tell that to the families with the
□

19:54:44 1 12 people who died as a result of the El Paso
2 pipeline explosion in the '90s. The force of
3 the explosions associated with the disaster was
4 strong enough to set off three seismic readings
19:54:53 5 that were used as evidence in wrongful-death
6 lawsuits against El Paso.

7 Ground shift is enough of a concern in
8 this area that Mike Kay would -- with Northwest
9 Natural Gas, NorthernStar's partner, has told
19:55:07 10 more than one landowner that following the KB
11 pipeline is not an option along most of the
12 route for that exact reason. No human life is
13 an acceptable risk, and for this data to be
14 left out or generalized is unacceptable.

19:55:22 15 Thank you.

16 MR. FRIEDMAN: Thank you for your
17 comments.

18 Again, I would ask if anyone who has not
19 spoken previously who wishes to speak, please
19:55:34 20 raise your hand now. Please come on up, and
Page 52

62

PM5 RN-110707-FERCpm.txt

21 you have the opportunity. I just ask that you
 22 state your name and spell your last name for
 23 the record.

24 MR. JERRY JANSSEN: I can do that. My
 19:55:45 25 name is Jerry Janssen, J-A-N-S-S-E-N. So 63
 □

19:55:50 1 anyways, I'm not real prepared here. I'm not
 2 going to -- I don't have the draft EIS. I'm
 3 just going to give you a couple of my opinions.

PM5-54

4 First of all, in the overall project, I
 19:56:01 5 grew up in Astoria, and I remember, you know,
 6 20, 30 years ago, fishing was a very large
 7 industry down there, and it pretty much has
 8 dwindled away. So with that in mind, it kind
 9 of doesn't make sense for me, even though I
 19:56:17 10 don't live there but I still have family and
 11 friends there, to -- how they can think that
 12 they're going to spend a bunch of money to
 13 bring the salmon back or protect the salmon,
 14 and on and on and on, while they're doing so
 19:56:31 15 much damage to the river. Okay? The salmon
 16 haven't come back in 30 years, so I don't
 17 know -- money isn't going to make them come
 18 back.

PM5-55

19 The other thing that kind of concerns me
 19:56:41 20 is, you know, you put this plant at the mouth
 21 of the -- near the mouth of the Columbia and
 22 bottleneck it, when you got four or five ports
 23 upriver, and supposedly these ships have to be
 24 escorted in and out, which nobody really knows
 19:56:59 25 for sure because the Coast Guard is being very
 Page 53

Public Meetings

5

PM5-54 See our response to comment PM3-68.

PM5-55 The Coast Guard determines how LNG carriers would be escorted in its WSR and LOR. With expansion of the vessel traffic information system, we do not anticipate significant impacts on shipping traffic during operation of the project. See also our response to comment PM5-46.

PM5-55 19:57:02 1 hushed on what's actually required. Okay?
 cont'd 2 So, you know, people up the river I don't
 3 think realize -- maybe they do. I don't
 4 know -- that it's going to affect the shipping,
 19:57:16 5 you know, more than just the mouth of the
 6 Columbia.

PM5-56 7 The jobs. You know, I have friends that
 8 are union, you know, carpenters and jobs are
 9 good. Okay? So they're going to go work for a
 19:57:31 10 couple years maybe, get their pay, move on, and
 11 everybody's got families to support. That's
 12 fine. I don't have a problem with that. Five
 13 years from now or five years from when the
 14 plant's built, you know, you got 20, 30, maybe
 19:57:44 15 40 people working at this plant, probably
 16 aren't going to be from this area, probably are
 17 going to be more, you know, technical people.
 18 So, I don't know, you know, shortsighted. Who
 19 knows? I don't know.

PM5-57 19:58:00 20 The other thing that kind of concerns me,
 21 and this is now more of a personal deal, is
 22 probably for the last five years I've worked my
 23 ass off to buy this piece of property and built
 24 my house for my family, my kids. So now I get
 19:58:20 25 this rumor starting a few years ago that this
 19:58:23 1 pipeline is coming and pretty much going to go
 2 up 450 feet of my five acres that I own. So --
 3 but there again, I don't know for sure because

Public Meetings

5

PM5-56 As discussed in section 4.8.2.4, operation of the Bradwood Landing Project would result in about 65 new permanent positions. In addition, tug operations necessary to support the LNG terminal would require about 40 employees. NorthernStar plans to hire mostly local residents for operation of the proposed project.

PM5-57 Landowner compensation and the easement negotiation process are discussed in section 4.8.3.3. See our response to comment PM3-6. This project was not rushed, and was not kept a secret. We discuss dissemination of information about the project to the public in section 1.4. NorthernStar entered the Pre-filing review process with the FERC in March 2005, and we issued a Notice of Pre-filing Review on March 18, 2005. We issued a Notice of Intent to Prepare an EIS on September 13, 2005, and held public scoping meetings in Knappa, Oregon on September 29, 2005 and Cathlamet, Washington on October 26, 2005. NorthernStar filed its applications in June 2006, and the FERC issued a Notice of Application on June 15, 2006. NorthernStar was required to contact landowners along the route of its project according to our Pre-filing guidelines and regulations at 18 CFR 157.69(d)(5). We produced our draft EIS in August 2007, and held public meetings to take comments on the draft EIS in Knappa and Clatskanie, Oregon and Longview and Cathlamet, Washington in early November 2007. Our notices went out to federal, state, and local officials and agencies, non-governmental organizations and regional environmental groups, Indian tribes and Native American organizations, landowners, and local libraries and newspapers.

PM5-57
cont'd

PM5 RN-110707-FERCpm.txt
nobody can give us a straight answer. okay?

19:58:38 5 Because a lot of this is hushed.

6 So I'm at the point where I don't know
7 what I'm supposed to do with my property. Do I
8 let the -- let them come in? Do I get a
9 lawyer? Do I fight it? Can I fight it? I
19:58:52 10 don't have, you know, money to fight it. You
11 know, so there you go. I just -- I don't know.
12 I think the project is moving ahead too
13 quickly, and with all these comment periods, 30
14 days or whatever they are, and the decisions
19:59:07 15 are too big to be made in that short of time.
16 And the only information that I've really
17 received directly was a letter a few years ago
18 from somebody basically asking permission to
19 survey my property. And being on the pipeline
19:59:28 20 route, I haven't received anything else in that
21 amount of time, other than this Corps of
22 Engineers report that was inaccurate. And it's
23 just -- there's so many questions to be
24 answered, I just don't really see how it can be
19:59:45 25 done in 30, 40 days or whatever the time line

□

19:59:47 1 is. So anyways, thank you.
2 MR. FRIEDMAN: Thank you for your
3 comments.
4 As those of you know, in our notice of
19:59:55 5 availability, there is 120-day comment period
6 on the DEIS, 120 days. So don't think that's a
7 short time or period.
8 UNIDENTIFIED SPEAKER: Could you mention

Public Meetings

PM5 RN-110707-FERCpm.txt
 the deadline, please, Paul.

20:00:10 10 MR. FRIEDMAN: The deadline is December
 11 24, 2007, for comments on the DEIS. If you
 12 don't know if you are a property owner on the
 13 pipeline, there are NorthernStar
 14 representatives in the room. Please talk to
 20:00:22 15 them. I think they can tell you whether or not
 16 their pipeline is crossing your property.
 17 Next on -- no. Once again, is there
 18 anyone who has not spoken who would like to,
 19 who has not spoken before? Please come up,
 20:00:39 20 state your name, and spell it for the court
 21 reporter.
 22 MS. NANCY ASHLEY: I'm Nancy Ashley.
 23 A-S-H-L-E-Y.
 24 I was raised Native American. This land,
 20:00:52 25 the trees, the fish, the rivers, the mountains,
 26
 20:00:55 1 all of it is our religion. It's our life.
 2 It's our great spirit. This river is a living
 3 entity. It's not just something to be used to
 4 make money for big business, to benefit
 20:01:08 5 somebody on the other side of the earth. The
 6 U.S. government has run over us from the
 7 beginning. Thank you.
 8 (Applause.)
 9 MR. FRIEDMAN: Thank you for your
 20:01:19 10 comments.
 11 Is there anyone else who has not
 12 previously spoken who would like an opportunity
 13 to do so at this time? If not, I'm going to
 Page 56

67

Public Meetings

5

PM5-58 We discuss consultations with Indian tribes and Native American organizations in section 4.9.3.

PM5 RN-110707-FERCpm.txt

14 start calling on people who have previously
 20:01:31 15 spoken but want a second opportunity.
 16 Duncan, you're the first. And don't
 17 forget when you come up here to restate your
 18 name and spell it again for the court reporter.
 19 I'm sorry that that's redundant.
 20:01:42 20 MR. DUNCAN MacKENZIE: Good evening. My
 21 name is Duncan McKenzie. D-U-N-C-A-N,
 22 M-A-C-K-E-N-Z-I-E.
 PM5-59 23 Your attention is directed to the
 24 discussion of routine discharge condensing
 20:01:52 25 water from the submerged combustion vaporizers 68
 20:01:54 1 as found on pages 4-149 and 4-150 of the DEIS.
 2 It is noted that the discharge will be
 3 approximately 68 degrees and will contain a
 4 concentration of total dissolved solids of ten
 20:02:07 5 times the concentration found in the river.
 6 It is assumed that the dissolved solids
 7 are the reaction products arising from the
 8 treatment using caustic soda to adjust the PH
 9 of the condensive water to a neutral state, and
 20:02:21 10 these reaction products are typically carbon,
 11 sodium carbonate and sodium nitrate.
 12 The National Marine Fishery Service has
 13 commented on this aspect in its request for
 14 additional information on the Bradford Landing
 20:02:34 15 LNG terminal on page 10, lines 27 through 43.
 16 The applicant has partially replied to the
 17 National Marine Fishery Service in a letter
 18 dated the 6th of July on pages 25 and 26: The

Page 57

Public Meetings

5

PM5-59 The temperature of the SCV discharge would meet Oregon Standards without treatment. As stated in section 4.3.2.3 using LNG in a heat exchange process to further cool the SCV discharge would not be economically feasible or practicable at the Bradwood Landing LNG terminal.

PM5-59
cont'd

19 PM5 RN-110707-FERCpm.txt
scaling down of a heat exchanger system to use
20 LNG to cool the discharged water is too
21 expensive and not a feasible solution.
22 However, this argument is found less than
23 convincing as one finds in appendix D on pages
24 217 and 218 of the Kitimat LNG terminal
20:03:04 25 environmental assessment report and
□ 69

20:03:06 1 comprehensive study prepared by the British
2 Columbia Environmental Assessment Office, dated
3 13 April 2006, that the proposed and permitted
4 LNG terminal at Kitimat will employ a covered
20:03:18 5 settling pond, precipitated dissolved solids,
6 and an LNG-to-conductive-water heat exchanger
7 to hold the discharged water to within half a
8 degree centigrade of the receiving waters.

PM5-60

9 There is a concern that the current design
20:03:30 10 envisioned by the applicant does not address
11 the long-term effects on the downstream river
12 environment occasioned by a localized plume of
13 alkalin material emanating from the outfall.
14 As found in the United Nations Environment
20:03:45 15 Program Publication, sodium carbonate --
16 initial assessment report for SIAM 15 held in
17 Boston in October of 2002, sodium carbonate in
18 concentrations greater than a hundred
19 milligrams per liter will cause mortality in
20:03:59 20 fish.
21 However, for salmon and trout lethal
22 effects were observed at levels of 67 to 80
23 milligrams per liter. Add to this the active

Page 58

Public Meetings

5

PM5-60 The SCV discharge would meet ODEQ standards and NPDES permit requirements. The pH of the discharge would be adjusted so that it would be neither too alkaline nor too acidic. We do not anticipate that alkaline sediment buildup would occur downstream of the LNG terminal.

PM5-61	24	PM5 RN-110707-FERCpm.txt and chronic mixing aspect now found in the	70
	20:04:10 25	applicant's thermal mixing model of hexavalent	
	20:04:14 1	chromium and silver, and the insult to the	
	2	salmon is exacerbated.	
PM5-62	3	In view of the applicant's numerous press	
	4	releases extolling its environmental	
	20:04:23 5	responsibility, and as found at the bottom of	
	6	4-150, quote: The applicant has committed to	
	7	provide an overall benefit to the environment	
	8	of the lower Columbia River ecosystem. The	
	9	applicant's argument of expense found in the	
	20:04:36 10	response to the Fishery Service is considered	
	11	unavailing as a justification for ignoring	
	12	practicable thermal pollution mitigation	
	13	measures for this critical habitat area.	
	14	In view of the potential thermal pollution	
	20:04:49 15	of the receiving waters and the potential for	
	16	long-term discharge of alkaline sediment into	
	17	the river over the operational life of the	
	18	facility, it is strongly suggested that, in	
	19	addition to the recommendation requiring the	
	20:05:02 20	applicant, as he has now furnished the	
	21	thermal-mixing model, FERC recommend to the	
	22	applicant that they fully examine and address	
	23	the long-term effects of alkaline sediment	
	24	buildup downstream of the STP outfall and to	
	20:05:14 25	review the Kitimat LNG system of discharge	71
	20:05:17 1	water treatment for possible incorporation of	
	2	this system into the applicant's proposed	
		Page 59	

Public Meetings

5

- PM5-61 As described in section 4.3.2.3, the thermal mixing modeling was conducted under a scenario of worst-case conditions, and assumptions were made about the presence of chromium VI, which is not a contaminant expected to be produced in the regasification process. Even under these worst-case conditions, the SCV discharge would meet the NPDES permit requirements. See also our response to comment FA1-14.
- PM5-62 The SCV discharge would meet thermal standards so no mitigation is required.

PMS RN-110707-FERCpm.txt

3 facility design.

4 Thank you very much.

20:05:23 5 MR. FRIEDMAN: Thank you for your
6 comments.

7 Gloria MacKenzie. By the way, when I get
8 written comments given to me directly, like
9 this case with Gloria, I do put them into the
20:05:48 10 public record.

11 MS. GLORIA MACKENZIE: Thank you. Good
12 evening, Mr. Friedman and staff. My name is
13 Gloria MacKenzie. M-A-C-K-E-N-Z-I-E.

PM5-63

14 This evening I am speaking for myself and
20:06:00 15 on behalf of the Audubon Societies of Willapa
16 Hills, Portland, and Washington state. I am
17 submitting a CD and testimony from the October
18 22nd Clatsop County Board of Commissioners
19 hearing in which I also addressed the
20:06:16 20 information regarding the need for LNG. I will
21 continue to refer to these reports now.

22 In the introduction page 1-3 of the DEIS
23 it states, and I quote: There has been and
24 will continue to be an increasing demand for

20:06:32 25 natural gas in the United States and the
□

72

20:06:35 1 Pacific Northwest, end of quote.

2 I have two problems with this statement.

3 One, in the July 10 public hearing Gary

4 Coppedge, senior vice president, clearly stated

20:06:48 5 that the gas is not going to California, but

6 that it is to remain in the Northwest and not

7 even mentioning anything about the rest of the
Page 60

Public Meetings

5

PM5-63 See our response to comment PM1-23.

PM5 RN-110707-FERCpm.txt

8 West.

PM5-64

9 Two, the information that I have just --

20:07:04 10 the information -- excuse me. The information
 11 that I have seen to justify the demand or need
 12 for natural gas has been exaggerated.

13 NorthernStar has repeatedly in their
 14 presentations used the economic impact analysis

20:07:18 15 of Dr. Philip Romero and information from the
 16 Northwest Gas Association. In several
 17 instances the information has been doctored,
 18 materially altered, or eliminated to establish
 19 need. A complete letter with this information

20:07:36 20 and backup material, more of this, will be
 21 submitted to FERC.

22 While none of this information appears in
 23 the DEIS, it has been used locally to establish
 24 and justify the need for the proposed zoning

20:07:55 25 and comprehensive land use changes and

73

20:07:58 1 amendments. If you and your staff look at the
 2 volume 2 under the section entitled Safety
 3 Advisory Report, you will find a 24-page
 4 document from the Clatsop County Community

20:08:14 5 Development Department -- I'm not sure how it
 6 got stuck in that section. But anyway, it did.
 7 In it you will find goal two, land use
 8 planning, which discusses public need as a
 9 basis for amending our long-standing county and
 20:08:32 10 state comprehensive plans.

11 In conclusion, if we are discussing need
 12 for additional gas supplies in the Northwest, I
 Page 61

Public Meetings

5

PM5-64 See our response to comment PM1-8.

		PMS RN-110707-FERCpm.txt	
PM5-64 cont'd	13	do not believe that the applicant has displayed	
	14	sufficient reason to change our local or state	
	20:08:48 15	approved plans. I would ask that FERC and its	
	16	staff to please consider the information from	
	17	the Northwest Power and Conservation Council	
	18	when reviewing the matter of energy needs for	
	19	the Northwest.	
	20:09:02 20	Thank you for your attention to this	
	21	matter, and I'm sure you're very tired by this	
	22	time. Thank you.	
PM5-65	23	MR. FRIEDMAN: I'm just getting started.	
	24	I'm not tired at all. Thank you for your	
	20:09:10 25	comments.	74
	20:09:11 1	Next is Frans.	
	2	MR. FRANS EYKEL: Good evening. Thank you	
	3	for accepting our comments. Eykel, E-Y-K-E-L,	
	4	my last name.	
	20:09:29 5	My comments are in reference to the DEIS,	
	6	page 4-78, the water resources. This is -- the	
	7	data is not in your DEIS. This was a document	
PM5-65	8	submitted, a technical memo by Coast & Harbor	
	9	Engineering for NorthernStar about the mixing	
	20:09:53 10	zone analysis for Bradwood Landing point-source	
	11	discharges.	
	12	I'd like to mention a minor error on	
	13	paragraph 2.4, page 3, where they mention a	
	14	flow rate of 4,200 gallons per hour. This in	
	20:10:16 15	regard to fire/water discharge. It should read	
	16	4,400 gallons per minute.	
	17	My other comment is in regard to the	

Public Meetings

5

PM5-65 The discussion of water resources in section 4.3 has been revised.

PM5 RN-110707-FERCpm.txt

PM5-66

18 memorandum, paragraph 2.2, page 2 and 3, the
 19 hydrodynamic conditions. The analysis of the
 20:10:37 20 mixing zone was intended for a worst-case
 21 scenario of the -- and under hydrodynamic
 22 conditions. The research recognized a reversal
 23 flow of the river during flood stage -- excuse
 24 me -- which is very significant at times. The
 20:11:02 25 memorandum, however, uses a 0.0 foot per second

75

20:11:10 1 flow as a worst-case scenario.
 2 And I disagree with this statement or with
 3 the practice of the modeling because as they
 4 discharge the effluent and the river reverses
 20:11:23 5 flow again, it actually gets a double dose of
 6 the effluent, and you get a much stronger plume
 7 of discharge.

PM5-67

8 My major concern, however, is the amount
 9 of chromium 6 created by the -- by the process,
 20:11:44 10 by the submerged conversion vaporizers. They
 11 create .27 milligram per liter, and I know that
 12 doesn't sound very much, but if you figure that
 13 the United States export/import bank, the
 14 baseline total -- total for chromium is .5,
 20:12:12 15 this being .27 for chromium 6 only. You also
 16 have discharge of additional chromium, of
 17 chromium 3, which is a beneficiary chromium,
 18 but total chromiums should never exceed .5 by
 19 the World Export Bank, which finances
 20:12:34 20 third-world country infrastructure, not the
 21 United States.

22 And the total discharge of this chrome
 Page 63

Public Meetings

5

PM5-66 See our response to comment IND27-2.

PM5-67 Existing data for chromium in SCV discharges are sparse and are expressed for total chromium only. Because ODEQ standards specify chromium VI, as a worst case scenario the available data (total chromium) used for the thermal mixing modeling was assumed to represent chromium VI. Because only one data point above detection limits was available (0.03 mg/L), statistics were used to determine an even more conservative value by multiplying the measured concentration by a factor of 9. See also our response to PM5-61.

		PM5 RN-110707-FERCpm.txt	
PM5-67 cont'd	23	crumb is 190.55 pounds per year, that being in	
	24	the estuary, with the cumulative effect of	
	20:13:00 25	years of operation, and subsequent dredging of	76
	20:13:04 1	the channel would -- would create considerable	
		pollution, and because of that issue I have	
		notified the U.S. Corps of Engineers to make	
		them aware of the situation. Since we are a	
	20:13:26 5	beach nourishment site, I will refuse any and	
		all dredge oils on our property from now on,	
		and if I refuse it, nobody else gets it because	
		we all have to agree on this. And for the	
		Corps to lose that -- that much potential of	
	20:13:45 10	dredge-oil property, upland property, is	
		detrimental.	
PM5-68	12	I have two requests for you, Paul. In	
	13	your presentation you show a liquefaction on	
	14	your slides. You show a liquefaction plant. I	
	20:14:03 15	was wondering if since we are here talking	
		about a regasification facility, if you could	
		show a slide of a regasification facility with	
		submerged conversion vaporizers, because these	
		vaporizers have large -- it's all stacks, 48	
	20:14:22 20	inches in diameter, per -- per vaporizer. And	
		this facility will have -- this proposed	
		facility will have seven of them. And that is	
		another addition of site pollution.	
		One more item, a request for NorthernStar	
	20:14:43 25	to be more forthcoming and show those stacks on	77
Page 64			

Public Meetings

5

PM5-68 Our figures presented in the EIS include a depiction of the stacks.

Public Meetings

5

K-222

PM5-68
cont'd

20:14:47 1 PM5 RN-110707-FERCpm.txt
their artwork and make people aware of that --
2 that is what you see, not just camouflaged
3 tanks and minimize ship sizes and maximize
4 river property, but put it in the right

20:15:02 5 perspective. Thank you very much.

6 MR. FRIEDMAN: Thank you for your
7 comments. And, Frans, if you have more
8 detailed comments, please send them in writing.
9 You know we like stuff in writing.

20:15:14 10 MR. FRANS EYKEL: They're in the mail.

11 MR. FRIEDMAN: Thank you.

12 Next is Gary Allen. Is Gary not here?

13 Okay. Chris Bock?

14 MR. CHRISTIAN BOCK: Hello. My name is

20:15:42 15 Christian Bock, B-O-C-K, but I go by Kilo. I
16 live on the west end of Cowlitz County.

PM5-69

17 Before I built a house on a cliff, I hired
18 a geologist, and he advised me how to

19 distribute the load on the cliff side and to
20:16:07 20 remove any excess weight from the side to the
21 river, upon which I removed 570,000 pounds and
22 built a house. Now the starting point for the
23 pipeline is near my house, behind it, and from
24 that point it is planned to drag a pipe

20:16:33 25 approximately one mile long under the Columbia
□

78

20:16:37 1 River. An extreme force has to be applied,
2 which is distributed in the ground towards the
3 river.

4 When Mr. Garrett was asked about how he
20:16:58 5 will prevent this hillside from collapsing,

PM5-69 See our response to comment PM1-41.

PM5-69 cont'd

PM5-70

PM5-71

PM5 RN-110707-FERCpm.txt

which so far it's pretty stable, but we prevent it -- we try to prevent any unbalance. Now, if the pipeline is put through there, at the moment it may be stable, but after a few years of heavy rain and a little earthquake, I'm afraid the situation will not just slide my house down, but also it may break the 36-inch pipeline or sheer it off, which would be a disaster beyond our imagination.

Of course, NorthernStar says it needs a source of ignition, but if pipeline -- if steel is ruptured, I understand sparks could fly and offset it. On the other hand, we have no escape route. Even an automobile engine could be a source of ignition. So I would like to register that I'm -- a definite objection for this pipeline project.

Another situation is that we don't really need the natural gas here. The state of Washington does not have any financial

benefits. We just have negative effect. Thank you.

MR. FRIEDMAN: Thank you for your comments.

Next is Bill castle.

MR. BILL CASTLE: Thank you. My name is Bill Castle, C-A-S-T-L-E. My comments tonight will be directed towards the sections of the DEIS that address private water supplies, wells.

Public Meetings

5

PM5-70 Section 1.1 is a brief summary of the purpose and need for this project. However, the Commission will make a final decision about need in its project Order.

PM5-71 NorthernStar has prepared a preliminary well protection plan which states that in the event of a disruption to a water supply, a freshwater tank truck and pump assembly would be immediately supplied to the affected party. A third-party well contractor would assess the situation and remedy the existing well or construct a new well if necessary. Any potential disruptions to water supply would occur during the active construction phase of the project and therefore we do not believe an escrow account would be necessary. FERC would monitor the project throughout construction and restoration to ensure compliance with the applicant's proposed construction procedures and mitigation measures as identified in the EIS and conditions of the FERC Certificate.

PM5-71
cont'd

11 PM5 RN-110707-FERCpm.txt
On page 4-59, paragraph 3, we are told in

12 the event of that water well is damaged as a

13 result of the construction, NorthernStar would

14 arrange for a temporary source of potable

20:19:11 15 water, if required, and provide for the repair

16 of the well or replace the water supply. On

17 page 4-314, in the last paragraph, we are told

18 there could be potential damage to existing

19 septic systems or wells.

20:19:31 20 This is a major concern to a majority of

21 the landowners along the pipeline route. If

22 our water is gone, our property is worthless.

23 What is meant by "replacement of water supply"?

24 Does that mean potable water will be trucked in

20:19:47 25 daily for infinity? How about those of us that

80

20:19:51 1 irrigate with it in the summer for three or

2 four weeks, 24/7?

3 If NorthernStar is so sure that they will

4 not disturb the wells, and which I've had

20:20:03 5 conversation with three members, let them put

6 their money on the table. Let the money speak,

7 not their mouth. Put this money in an escrow

8 to be able to secure a replacement possibility.

9 We don't want to risk them going bankrupt, like

20:20:23 10 some in the country have.

PM5-72

11 In the Mill Creek area, there are six

12 wells forming a circle around and within 300

13 feet of the approximate Columbia River HDD

14 site. An additional 14 wells are within 1,320

20:20:41 15 feet, a quarter mile, of the drill site. All

Page 67

Public Meetings

5

PM5-72 See our response to comment PM1-40.

PM5-72
cont'd

16 PM5 RN-110707-FERCpm.txt
of these wells potentially share the same
17 aquifer. That drill site goes right through
18 the fractured basalt that supplies the water
19 coming from the aquifer. All 20 of these wells
20:20:58 20 have the potential of becoming contaminated
21 from the bentonite or loss of water,
22 potentially all the waters.

23 Let's remember the final depth of this
24 pipe going under the river we were told by Mike
20:21:12 25 Heywood, representative of Northwest Natural

81

20:21:14 1 Gas, would be approximately a 600-foot drill,
2 to be 50 feet below the bottom of the channel.
3 Based on the information supplied by Mike
4 Heyward on -- Heywood on the drill site,
20:21:30 5 placement of the drill would be at a 13-degree
6 angle and the HDD -- for the HDD, 13 degrees.

7 Since common sense tells us the hole will
8 be about 500-foot mark, will be within ten to
9 99 foot of some of the water wells at the
20:21:47 10 bottom of the hill, which are only drilled to
11 125 feet. Our well is 522 feet deep and
12 supplies 14.5 gallons a minute with a static
13 column of water 140 feet from the surface,
14 which means we have 382 feet of water at our
20:22:07 15 disposal at any time.

PM5-73

16 More importantly data listed on table
17 4.3.2-2 where NorthernStar indicates 20 private
18 wells within 150 feet of the pipeline
19 construction is incomplete. Many wells in
20:22:22 20 Cowlitz County are not registered and,

Page 68

Public Meetings

5

PM5-73 Table 4.3.1-2 is not intended to be a comprehensive list of all wells but only those wells within the state databases at the time of the search. NorthernStar would work with property owners along the pipeline route to identify new or unregistered wells located in or near the construction right-of-way.

PM5-73
cont'd

21 PMS RN-110707-FERCpm.txt
therefore, not listed. Our own well was not
22 listed a year ago and does not appear on that
23 chart. Our well will be within 150 feet or
24 less of the construction area, to our best
20:22:38 25 knowledge. 82
□

20:22:39 1 MR. FRIEDMAN: Mr. Castle, please wrap it
2 up.
3 MR. BILL CASTLE: One paragraph.
4 The DEIS needs to include more information
20:22:45 5 and requirements for loss or contaminated --
6 contamination of water due to construction of
7 the pipeline. An open time frame needs to be
8 included over the life of the pipeline.
9 Remember, FERC, we did not ask NorthernStar or
20:23:01 10 any other private utility to disturb us.
11 Mr. Friedman, I'd also like you to know
12 that you keep making comments to ask a
13 NorthernStar member about where this pipeline
14 is. Two weeks ago in Astoria I had a
20:23:17 15 conversation with Mr. Si Garrett and Mr. Paul
16 Soanes about where the hole was to be drilled
17 on this ridge. Mr. Garrett would not answer me
18 other than, "It is not on your property." But
19 he would not tell me where it's at. Mr. Paul
20:23:34 20 Soanes told me that he would get back to me and
21 promised that he would share that information.
22 To this date, that has not happened, sir.
23 MR. FRIEDMAN: Is there a representative
24 from NorthernStar here who could stand up,
20:23:48 25 please? Mr. Coppedge, would you be able to 83
□

Page 69

Public Meetings

PM5 RN-110707-FERCpm.txt

20:23:51 1 answer Mr. Castle's -- privately, his question?
2 Thank you.

3 I want to remind everyone to please try to
4 keep your comments to three minutes, and if you
20:24:09 5 have detailed comments that would exceed three
6 minutes, we would welcome your written comments
7 sent in to FERC.

8 Next is Gayle Kiser.
9 MS. GAYLE KISER: Gayle Kiser. That's
20:24:28 10 G-A-Y-L-E, K-I-S-E-R, but I'm sure you remember
11 from my previous speeches.

PM5-74

12 Last night I spoke to the specifics.
13 Tonight I'm here to speak to the process as a
14 whole. This document has all the appearances
20:24:41 15 of being rushed into print. Why? The former
16 head of your agency was quoted as saying that
17 the United States only needed about eight
18 receiving terminals. At this date, I believe
19 around 22 have been permitted. Again, why?

20:24:58 20 I believe the answer lies in the Energy
21 Policy Act of 2005. We were warned by our
22 legislators what would happen if FERC were
23 given sole siting authority over LNG
24 facilities, but we didn't pay close enough
20:25:11 25 attention. I'm in the process of contacting
□

84

20:25:13 1 every Senator and Representative in every state
2 that is experiencing a battle over where to put
3 these facilities and asking them to revisit
4 that act and the Natural Gas Act, paying
Page 70

Public Meetings

5

PM5-74 See our responses to comments PM2-20 and PM2-32. The FERC's role as the lead federal agency responsible for authorizing onshore LNG import terminals was outlined by Congress in the NGA, and clarified in the EPAct 2005. The laws were not kept secret, and the EIS discusses them in section 1.0.

		PM5 RN-110707-FERCpm.txt	
PM5-74 cont'd	20:25:25	5	particular attention to the Hackberry decision.
		6	Many people don't realize what this
		7	decision does. It flew in under the radar, and
		8	I seriously doubt if many of our Congresspeople
		9	even realize it exists. It incentivizes the
	20:25:41	10	building of LNG facilities. I love that word,
		11	"incentivize." Even my computer doesn't
		12	recognize it.
		13	By making a special law that removes all
		14	commercial regulations covering tariffs, rates,
	20:25:51	15	and open access, you handed the energy
		16	companies the key to the cash box. That
		17	explains the rush to build these plants and
		18	I believe the rush to colonize the Pacific
		19	Northwest.
PM5-75	20:26:04	20	I've attended many meetings in the past 18
		21	months, and two demographics stand out: One,
		22	the average age and, two, the average income of
		23	the people whose lives are going to be
		24	destroyed by the proposed pipelines. Most are
	20:26:15	25	elderly, rural folks who only want to retire on
			85
	20:26:18	1	their property, and most are in the lower
		2	income bracket. It is unconscionable to ask
		3	them to bear the brunt of this assault so
		4	energy speculators can make another huge profit
	20:26:30	5	at their expense. I believe this is
		6	inadequately addressed in the DEIS.
		7	In a time when we see certain portions of
		8	the federal government shrinking -- for
		9	instance, here locally the U.S. Forest Service
			Page 71

Public Meetings

5

PM5-75 As discussed in sections 4.8.1.9, 4.8.2.9, and 4.8.3.9, low-income and minority populations would not be disproportionately affected by the proposed project.

PM5 RN-110707-FERCpm.txt

20:26:41 10 had to recently close the Coldwater Ridge
 11 visitors' center on Mount St. Helens -- it
 12 would seem FERC is experiencing a growth boom.
 13 You people have been handed a tremendous amount
 14 of power, and with that should be a tremendous
 20:26:55 15 amount of responsibility.

PM5-76

16 I am sorely disappointed in the DEIS. I
 17 expected so much more from an agency with the
 18 power you have. It is my opinion that this
 19 document is deficient and should be completely
 20:27:08 20 reissued. Next time include material that will
 21 help in the decision-making process, things
 22 like an emergency response plan, the complete
 23 water suitability report, the completed
 24 biological assessment, an independent needs
 20:27:25 25 assessment, and an independent economic

86

20:27:27 1 assessment.
 2 Rework your evaluation criteria to include
 3 the human element. If this cannot be done,
 4 then this document should be placed where it
 20:27:36 5 will never be affected by solar energy.

6 MR. FRIEDMAN: Thank you for your
 7 comments.

8 Next is Steve Dragich.

9 MR. STEVE DRAGICH: Mr. Dragich,
 20:27:54 10 D-R-A-G-I-C-H, representing Dragich Trust.

PM5-77

11 The specific comments I have tonight deal
 12 with the local court's designation in the
 13 FERC's introductory statement, presentation,
 14 and CFR 49192.5, class location. If time
 Page 72

Public Meetings

5

PM5-76 See our response to comment PM4-20.

PM5-77 Section 7h of the NGA states when a holder of a FERC certificate cannot reach an agreement for an easement with a landowner, it may "acquire the same by the exercise of the right of eminent domain in the district court of the United States for the district in which such property may be located...." In other words, the settlement would be made in the local district court. Or, the settlement may be made in an applicable local state court if the value is less than \$3,000. Maps of the pipeline route are in Appendix B of the EIS.

Public Meetings

5

PM5-77
cont'd

PMS RN-110707-FERCpm.txt

20:28:16 15 permits, ex parte communications and CEI
16 revision order, CEI standing for critical
17 energy infrastructure information.
18 In your introductory comment to this DEIS
19 presentation, you mention local courts if a
20:28:37 20 negated settlement is unable to be reached, yet
21 on August 8th, 2005, President Bush signed the
22 Energy Policy Act, giving you, FERC, exclusive
23 jurisdiction over LNG facilities. The
24 cooperating agencies are exclusively federal,
20:28:56 25 as designated in the DEIS: United States Army
□ 87

20:29:01 1 Corps of Engineers, U.S. Coast Guard, U.S.
2 Department of Transportation.
3 Yet you distinctly do not mention the
4 United States District Courts as a remedy for a
20:29:13 5 person or landowner unable to come to
6 negotiated agreement; yet if you uses the local
7 courts, using an example from the Superior
8 Courts of the State of Washington, RCW 8.24,
9 eminent domain, miscellaneous provisions, in
20:29:31 10 relation to order of immediate use and
11 possession, which a proponent such as a
12 pipeline or NorthernStar Energy Limited
13 Liability Corporation can request that the
14 landowner so stipulate to an order of immediate
20:29:52 15 use and possession.
16 If the landowner does not stipulate to the
17 order of immediate use and possession, he will
18 not receive court or attorneys' fees, yet there
19 is no such requirement under the U.S. federal
Page 73

Public Meetings

PM5-77
cont'd

PMS RN-110707-FERCpm.txt

20:30:08 20 court system, and payment for just compensation
21 has to be up front under the U.S. District
22 Court system.
23 To use an example from the office of
24 Washington State Attorney General, eminent
20:30:26 25 domain task force, assistant attorney general 88
□

20:30:29 1 Tim Ford and eminent domain task force member
2 Craig Johnson characterizes negotiations under
3 eminent domain as negotiation by shotgun.
4 I cannot tell you the location of the
20:30:48 5 pipeline on the Dragich Trust land. You must
6 first submit a CEII request to the FERC CEII
7 coordinator before I can tell you that
8 information, because I don't have it myself.
9 And if NorthernStar is to abide by that same
20:31:08 10 regulation, they have submitted documents
11 through their attorney, VanNess & Feldman in
12 Washington, D.C., citing privacy of individuals
13 on the pipeline for reasons for not releasing
14 pipeline maps or individual lists of pipeline
20:31:24 15 owners. These are filed under the FERC
16 Commission.
17 MR. FRIEDMAN: Mr. Dragich, can you wrap
18 it up, please.
19 MR. STEVE DRAGICH: In conclusion, under
20:31:35 20 the revision for CEII orders issued on October
21 30th, a week ago, FERC order 121 FERC 61.107,
22 it is now possible to access pipeline maps for
23 landowners and adjacent landowners to identify
24 which specific property -- property is under
Page 74

Public Meetings

5

PM5 RN-110707-FERCpm.txt

PM5-77
cont'd

20:31:57 25 threat of domain, which FERC has included a fee 89

20:32:02 1 requirement so we may find out which property
2 you will confer eminent domain over.

3 MR. FRIEDMAN: Thank you for your
4 comments.

20:32:11 5 Next, Vance Fraser.

6 MR. VANCE FRASER: Hello. My name is
7 Vance Fraser. It's F-R-A-S-E-R. I represent
8 myself and also Webb Drainage District in the
9 Oregon side.

PM5-78

20:32:30 10 I'd like to say that the Pacific Northwest
11 is and always has been Oregon, Washington, and
12 Idaho. Any references to the Northwest which
13 include any other areas outside Oregon,
14 Washington, and Idaho should not be allowed.

20:32:46 15 Any redefinition in terms from historic and
16 commonly understood is only intended to mislead
17 the public and responsible authorities. FERC
18 should not allow this and cause any information
19 or data outside Oregon, Washington, and Idaho

20:33:03 20 to be separated out in its own segregated area
21 within the DEIS, when it's been previously
22 referred to as in the Northwest, but outside
23 those three states.

PM5-79

24 Regarding dredging the turning basin for
20:33:25 25 the LNG vessels, NorthernStar should be 90

20:33:28 1 required to follow all the same rules the Corps
2 of Engineers are required to follow in their

Page 75

PM5-78 We agree that the Pacific Northwest would include the states of Oregon, Washington, and Idaho.

PM5-79 NorthernStar's sediment sampling followed applicable guidelines and approvals and all dredging would be carried out in accordance with the COE permit required under section 404 of the CWA.

PM5-79 3 PM5 RN-110707-FERCpm.txt
 Columbia River channel deepening project,
 cont'd 4 specifically sampling, removal, and disposal
 20:33:40 5 methods.

PM5-80 6 I'd also like to point out that my uncle
 7 was a ship captain, any ship, any ocean, and he
 8 was based out of Portland, Oregon. I've been
 9 up and down the river with them him, and I can
 20:33:52 10 tell you without a doubt he would not
 11 appreciate having to wait for an LNG ship while
 12 heading out to sea.
 13 The river channel is now being deepened to
 14 support grain exports, container ships and --
 20:34:08 15 that are supported by over 50,000 jobs. How
 16 soon before these export ships and jobs move
 17 elsewhere when LNG ships delay export ships,
 18 all for LNG which we don't need? And I ask
 19 that these economic impacts be made more clear
 20:34:32 20 and studied further and included in the DEIS.

PM5-81 21 As far as the Webb Drainage District,
 22 which is on the pipeline route, we depend on
 23 our levies to protect us from flooding. The
 24 soils in the districts such as ours is
 20:34:50 25 corrosive, saturated type at a depth the
 □

20:34:53 1 pipeline will be set at. The soil can also be
 2 described as jelly- and putty-like. When
 3 earthquakes occur or when heavy agriculture
 4 equipment cross over the pipeline, this will
 20:35:07 5 cause soil and pipeline movement and possible
 6 accelerated deterioration of the concrete
 7 fittings of the pipeline, which will also cause

Public Meetings

5

PM5-80 See our response to comment PM5-46.

PM5-81 Soil liquefaction relative to the pipeline is discussed in section 4.1.4.3. See also our response to comment PM1-32. Odorant (methyl mercaptan) is required for all natural gas distribution lines but it is not required, nor is it typically used, for interstate natural gas transmission lines. One reason it is not used for transmission lines is that methyl mercaptan can interfere with the end use if natural gas is being used as a manufacturing feedstock.

PM5-81 8 PMS RN-110707-FERCpm.txt
 accelerated corrosion of the pipe.

cont'd 9 The expected life of this pipeline cannot
 20:35:21 10 be considered to be even close to 50 years,
 11 especially when the KB pipeline leaked in less
 12 than one year in a similar district. Please
 13 address why we are not worth putting odorant in
 14 the line.

20:35:43 15 Thank you.

16 MR. FRIEDMAN: Thank you for your
 17 comments.

18 Next is Marjorie Castle.

PM5-82 19 MS. MARJORIE CASTLE: Marjorie Castle.
 20:35:56 20 C-A-S-T-L-E. This is my second time to speak
 21 before you, and another concern I wish to bring
 22 to your attention has to do with the roads in
 23 Cowlitz County.

24 Since the majority of this county would be
 20:36:09 25 considered rural, it must be brought to your
 □

20:36:11 1 attention, FERC, that the cliff -- that like
 2 Clifton Road, many roads are narrow, to the
 3 point of being single to one and a half lanes
 4 wide. Yes, these are paved roads. They are
 20:36:24 5 public roads.

6 I bring this up because in the DEIS, on
 7 page 2-35, paragraph 1, it reads:
 8 Modifications or improvements to existing roads
 9 used to access the project would not be
 20:36:37 10 required. It also says on the footnote A of
 11 table 4.3 -- 4.2.3-2, NorthernStar would use
 12 existing access roads that would not require

Public Meetings

5

PM5-82 Section 4.8.2.7 of the EIS has been revised to address NorthernStar's proposal for improvements to Clifton Road. Section 4.8.3.7 has been revised to include additional discussion of NorthernStar's requirements regarding local road permits and our recommendation that NorthernStar revise its final traffic management plan to include measures to reduce impacts on narrow roads (including Whitewater Road, AKA Old Mill Creek Road) that would be used to access the construction right-of-way.

PM5-82
cont'd

13 PMS RN-110707-FERCpm.txt
modification or improvement and would,
14 therefore, not represent additional soil
20:36:58 15 impacts.
16 Paragraph 3, page 4-98, NorthernStar would
17 use existing access roads, which would not
18 require modification or improvement and would,
19 therefore, not represent any additional impacts
20:37:11 20 on wetlands.
21 Page 4-305, paragraph 4, NorthernStar
22 would access the construction right-of-way via
23 existing public and private roads that
24 intersect the right-of-way. Modifications or
20:37:26 25 improvements to support the expected roads
□ 93
20:37:28 1 would not be required.
2 Whitewater Road is a public road. Yes, it
3 does eventually go into a private road. It is
4 only one example of the kinds of roads we have
20:37:41 5 in Cowlitz County. Many of them that
6 NorthernStar wishes to use at one time were
7 logging roads that have been paved over. They
8 are not two-lane or larger.
9 Whitewater Road is a planned access road
20:37:56 10 for NorthernStar to reach the site for the
11 Columbia River HDD. That road is paved, one
12 and a half lanes wide, has hazardous blind
13 spots and no turnouts for opposite traffic.
14 People currently use the shoulder, which is
20:38:11 15 gravel, as their turnout. Each side is
16 dangerous.
17 That road will be used for at least 37

Public Meetings

PM5-82
cont'd

18 PM5 RN-110707-FERCpm.txt
days during the drilling process. Three
19 tractor-trailers we've been told will carry the
20:38:25 20 drill rig and is extremely heavy. All the
21 support vehicles will be using that road.
22 Heavy vehicles this road is not accustomed to
23 will traverse its length. Twenty families
24 depend on that road as their only access in and
20:38:41 25 out on any daily basis.

94

20:38:44 1 This public road cannot withstand this
2 traffic, and those modifications are not
3 included or any consideration of modifications
4 of that road included, nor has the Cowlitz
20:38:56 5 County road department been apprised of this
6 situation. And this is not the only example.

PM5-83

7 There are many areas in the draft DEIS that are
8 not addressed. The biological assessment is
9 not finished and is not totally in there.
20:39:14 10 There is communication happening daily on
11 the FERC Web site, that we all read, that
12 indicate that the draft -- that the DEIS should
13 not have been released when it was.
14 Mr. Friedman, this piece of cheese (indicating)
20:39:28 15 is like the DEIS: It's full of holes.

16 Thank you.

17 MR. FRIEDMAN: Thank you for your
18 comments.

19 Next, Carol Kriesel.

20:39:47 20 MS. CAROL KRIESEL: I am Carol Kriesel.
21 K-R-I-E-S-E-L.

PM5-84 | 22 I have several concerns regarding the

Page 79

Public Meetings

5

PM5-83 See our responses to comments PM4-20.and PM5-26.

PM5-84 The maximum number of LNG carriers calling at the LNG terminal would be 125 per year. The Columbia River would not be shut down during LNG carrier transits.

PM5-84 23 PMS RN-110707-FERCpm.txt
 NorthernStar project, and jobs is one of them.
 cont'd 24 In the DEIS, on page ES-4, 65 jobs for a total
 20:40:04 25 annual payroll of 3.8 million is listed. Now, 95
 □
 20:40:08 1 I can tell you jobs are important, but I
 2 question at what risk to others. I'm not
 3 talking about injury to a person or to their
 4 property but employment risk. I don't do any
 20:40:17 5 of that new math they teach kids, but I'm
 6 pretty good at adding and subtracting.
 7 In the DEIS on page 2-3 under Section
 8 2.1., LNG ships, it states: NorthernStar has
 9 stated that it expects about 125 LNG carriers
 20:40:37 10 per year to unload cargo at its terminal, with
 11 LNG ships ranging in size from 100,000 to
 12 200,000 cubic millimeters in capacity.
 13 Seems to me good business sense leans
 14 towards getting the biggest profit you can go
 20:40:54 15 with the most, you can get and turn around and
 16 sell. So I'll start with the big ships which
 17 NorthernStar told the Coast Guard they wanted
 18 to use: Anticipated numbers of deliveries as
 19 stated in the DEIS, about 125. Size of ship,
 20:41:10 20 200,000 cubic meters. Total amount of LNG
 21 received per year, 25 million cubic meters.
 22 Now, the Coast Guard has determined
 23 NorthernStar can use no ships larger than
 24 148,000 cubic meters until some type of study
 20:41:26 25 is conducted on big ships and they are deemed 96
 □
 20:41:29 1 safe. So that means that best NorthernStar can
 Page 80

Public Meetings

		PM5 RN-110707-FERCpm.txt
PM5-84 cont'd	2	hope again for using, again, their 125
	3	shipments per year, is 118,500,000, cubic
	4	meters or a loss of about 6.5 cubic meters.
	20:41:46 5	I can't see NorthernStar or any other
	6	company choosing to lose money. I think they
	7	will try to recoup what they can. They have
	8	investors that want to see a return on their
	9	money. Therefore, NorthernStar will increase
	20:41:57 10	the number of shipments to gain that additional
	11	6.5 million cubic meters with an additional 44
	12	ships. That increase in traffic, with
	13	consideration of today's homeland-security
	14	issues, would mean there could be potentially
	20:42:14 15	three LNG tankers in the river at any given
	16	time, with one maybe even parked in the channel
	17	waiting its turn at the earth.
PM5-85	18	Because LNG is labeled a terrorist target
	19	and needing escort convinced me, and a whole
	20:42:29 20	lot of other people, this will not affect our
	21	ports. Nowhere in the DEIS is this potential
	22	negative economic issue addressed. Nowhere in
	23	the DEIS is the loss of jobs, far more than 65,
	24	addressed and what those losses will do to the
	20:42:43 25	economy of these two states if shipping is
	□	
	20:42:46 1	interrupted.
	2	I'm not saying the river and bar pilots
	3	are not capable in their jobs; I am saying
	4	security conditions change, and LNG will have a
	20:42:54 5	precedence over everything on this river but
	6	military and cruise ships. After all, the
		Page 81

97

Public Meetings

5

PM5-85 There is no evidence that the project would cause a loss of jobs, or have negative economic impacts. In fact, as discussed in section 4.8 of this EIS, the project would most likely have economic benefits for the region. The project should not have significant impacts on upriver ports, commercial shipping in the lower Columbia River, or other river users. See responses to PM1-52, PM3-9, PM5-31, and MP5-46. The Coast Guard determines requirements for escorts of LNG carriers in its WSR and LOR, and safety is discussed in section 4.11 of this EIS.

Public Meetings

5

PM5-85
cont'd

7 Coast Guard expressed these same concerns a
8 year ago last August.
9 NorthernStar uses the word "about." The
20:43:07 10 DEIS used the word "about." So what's the real
11 number of how many ships and what will the
12 impact beyond the ports on this river system,
13 which goes far beyond Portland? This topic
14 needs to be addressed. The livelihoods of
20:43:19 15 thousands of people depend on it.
16 Thank you.
17 MR. FRIEDMAN: Thank you for your
18 comments.
19 I've reached the end of the speakers'
20:43:27 20 list. Is there thing else who has not yet
21 spoken who wishes to do so?
22 If there is no one else who would like to
23 speak, who has not already spoken at this time,
24 I'm going to close the meeting. I want to
20:43:41 25 thank you all for coming tonight and for
□ 98

20:43:43 1 providing your comments on the Bradwood Landing
2 LNG project DEIS.
3 Let the record show that we concluded
4 tonight at approximately 8:43 p.m. Thank you.

Public Meetings

Public Meeting Transcript of Proceedings
Thursday, November 8, 2007, 6:30 p.m.
Knappa, Oregon

The introductory comments for this public meeting are not included in the FEIS because they are very similar to those of the Monday, November 5, 2007, 6:30 p.m. meeting in Cathlamet, Oregon, which are included. The complete transcript of the Tuesday, November 6, 2007, 6:30 p.m. meeting in Clatskanie, Washington can be obtained at the FERC's internet website (www.ferc.gov) using the eLibrary link. Click on the eLibrary link, click on "General Search," and enter the docket number excluding the last three digits in the Docket Number field (i.e., CP06-366). Be sure you have selected an appropriate date range. For assistance, please contact FERC Online Support at FERCOnlineSupport@ferc.gov or toll free at 1-866-208-3676, or for TTY, contact (202) 502-8659.

Public Meetings

Public Meetings

6

PM6 RN-110807-FERCpm.txt
 11 signed up on the speakers' list to do so. So
 12 if you haven't signed up but you wish to speak
 13 tonight, you can go back to Janelle and sign
 14 up, and we'll reconvene in about three minutes.
 18:55:25 15 (Recess.)
 16 MR. FRIEDMAN: All right. We'd like to
 17 reconvene and take public comments at this
 18 time. I was told during the break that you
 19 couldn't hear me in the back. Can you hear me
 19:00:59 20 in the back? Is the sound system working? If
 21 you can hear me in the back, raise your hands.
 22 Not very good. I apologize for that.
 23 UNIDENTIFIED SPEAKER: Reduce the bass,
 24 increase the treble, it might help.
 19:01:19 25 MR. FRIEDMAN: It's too late because I'm
 19:01:20 1 done speaking. A record of what I said will go
 2 in the public record. I understand my big rear
 3 end was blocking the slides. So we'll put the
 4 slides in the public record as well, so you can
 19:01:32 5 download it from the Internet.
 6 I'm going to call people in the order in
 7 which they signed up. You only have three
 8 minutes to speak. I am a runner and I have a
 9 stopwatch on my wrist at all times. So I will
 19:01:44 10 hold you to the three minutes so we're
 11 consistent between meetings.
 12 If you've spoken at previous meetings,
 13 you'll go last. We'll give you an opportunity
 14 to speak, but everyone who has not spoken will
 19:01:53 15 go first. I ask that you come up to the

17

Public Meetings

6

PM6 RN-110807-FERCpm.txt
 16 microphone here at the front. Hopefully, that
 17 will work better than this one. You need to
 18 tell us your name and spell your last name for
 19 the court reporter. Identify any organization
 19:02:06 20 you may represent, if you represent one. If
 21 you just represent yourself, you can say that.
 22 If you are a landowner along the pipeline
 23 route, please indicate where your property is
 24 according to the mile marks. If you don't know
 19:02:18 25 where your property is by the mile marks, see

18

19:02:22 1 if Janelle has a copy of the DEIS -- there are
 2 mile marks in the DEIS -- or ask a
 3 representative of NorthernStar. They may know
 4 where your property is located if you don't.

19:02:31 5 The first speaker don't is John Dunzer.
 6 Also, if I mispronounce your name, please
 7 correct me.

8 MR. JOHN DUNZER: John Dunzer,
 9 D-U-N-Z-E-R.

19:02:48 10 I'm a supporter of this project, which of
 11 course you don't really care about, which is
 12 fine with me. I've been a big supporter of
 13 this project but have become disenchanted with
 14 this particular EIS. This EIS, Section

PM6-1

19:03:00 15 3.1.6.3, alternative vaporization technologies,
 16 I feel is totally deficient and is not accurate
 17 and for the following reasons:

18 The sources of vaporization heat that were
 19 considered in this had to do with ambient air,
 19:03:17 20 river water, electrical power, wood chips,

Page 15

PM6-1 See our response to comment IND32-2.

PM6-1
cont'd

PM6 RN-110807-FERCpm.txt
 21 waste heat from cogeneration, natural gas. The
 22 waste heat from cogeneration was initially
 23 selected. However, there were some problems,
 24 technical problems, so that the NorthernStar
 19:03:29 25 just decided not to proceed that way, so they
 □
 19:03:31 1 selected natural gas as the method of heating
 2 up this LNG.
 3 Takes about one and a half percent of the
 4 product to heat it up. We have a new law in
 19:03:41 5 the state of Oregon, passed under emergency
 6 legislation August 6. It's called the Climate
 7 Control Act, which requires a reduction in
 8 greenhouse gas emissions in Oregon. This, of
 9 course, doesn't tell the federal government
 19:03:55 10 what to do, but it should tell people like
 11 Clatsop County what to do. But telling Clatsop
 12 County what to do is very difficult for anyone.
 13 But anyway, this will increase the
 14 greenhouse gas emissions by 1.5 percent -- from
 19:04:10 15 natural gas by 1.5 percent, but actually since
 16 it's a regional facility will increase natural
 17 gas emissions in the state of Oregon by 5
 18 percent. It's a little difficult to lower your
 19 greenhouse gas emissions when you're approving
 19:04:26 20 projects that increase them by 5 percent. This
 21 is a huge generator of greenhouse gases.
 22 Now, the states of California, Oregon,
 23 Washington, here in the west all care about
 24 this. There's a lot of people that care about
 19:04:42 25 this. We've got people over in Stockholm that
 □

19

20

Public Meetings

Public Meetings

6

PM6 RN-110807-FERCpm.txt

PM6-1
cont'd

19:04:44 1 even care about this. And there's nobody
2 paying any attention in this EIS about
3 greenhouse gas emissions. There are many, many
4 alternatives to natural gas to provide this
19:04:58 5 heat and a much better engineering solution for
6 this particular gasification plant. This is
7 30-year-old technology. It's tremendously
8 inefficient.

9 Now, I know I won't please most of the
19:05:10 10 people because I think we need this project in
11 the United States because we need energy
12 independence, and this is simply a way to try
13 to save some time in the next 40 years so we
14 can get there, and I think it's very important
19:05:24 15 that we do this project. But we don't need to
16 provide an inefficient, bad design to do it.

17 And so I fully support the project, and I
18 fully don't support the EIS because the
19 description is inadequate; it's not correct.
19:05:40 20 The information that's in there on wood chips
21 is not accurate. NorthernStar knows it's not
22 accurate. Everyone knows it's not accurate.
23 All the EIS contractor did was parrot back
24 exactly what NorthernStar gave them initially.

19:05:55 25 There are already changes in there. Nobody

21

19:05:56 1 wants to say what it is they're really going to
2 do in this project. They just want to keep on
3 going and pushing and pushing and pushing.

4 This EIS is inadequate for the FERC to
Page 17

		PM6 RN-110807-FERCpm.txt	
PM6-1 cont'd	19:06:10	5	make a technical decision on. I've been
		6	preparing federal EISs for longer than your
		7	biologist has been alive back there, and I know
		8	what the heck I'm talking about.
		9	MR. FRIEDMAN: Mr. Dunzer, wrap up,
	19:06:24	10	please.
		11	MR. JOHN DUNZER: All done.
		12	MR. FRIEDMAN: Thank you for your
		13	comments.
		14	I would appreciate if we don't applaud,
	19:06:29	15	don't boo, just be neutral and treat everyone
		16	the same. Thanks.
		17	Next is Debbie Twombly. And if I
		18	mispronounce your name, please correct me.
		19	MS. DEBBIE TWOMBLY: Thank you. I am
	19:06:44	20	Debbie Twombly, T-W-O-M-B-L-Y. I live in
		21	Brownsmead, Oregon, not far from the Columbia
		22	River. I am a Clatsop County native. I care
		23	deeply for this area. I am a mother, a
		24	daughter. I have grandchildren who live close
	19:07:02	25	by, and I want this place to stay safe for
			□ 22
PM6-2	19:07:05	1	them.
		2	What I want to bring to your attention
		3	today -- this may not be exactly what you're
		4	looking for, but I have an edition of National
	19:07:14	5	Geographic from February of this year, 2007,
		6	and it tells about, in an article on energy and
		7	oil edition, how in Nigeria there has been an
		8	LNG plant. And I'm not going to leave this
		9	because I need it for something else, but these
			Page 18

Public Meetings

6

PM6-2 Socioeconomic impacts are addressed in section 4.8.

Public Meetings

6

K-250

PM6-2
cont'd

PM6 RN-110807-FERCpm.txt

19:07:28 10 are the exact plants that the storage tanks
11 that are going to be in place at Bradwood, if
12 NorthernStar has their way.

13 And the caption: Uprooted to make room
14 for a liquified natural gas plant. People in
19:07:41 15 the village of Finima on Bonny Island complain
16 that the facility has damaged fishing grounds,
17 with few jobs offered in return. A native
18 there says, "It's not fair. We can hardly
19 catch fish anymore. Surviving is very hard."

19:07:56 20 It goes on to state that people were
21 forced to give up fishing. Young men of the
22 village had put their hopes in landing a job in
23 the facility, but offers are scarce. A quote
24 from another native, "People from the outside
19:08:11 25 get all the jobs."

23

19:08:12 1 I fear that that is exactly what we could
2 expect here. So not only are we losing natural
3 wetland habitat, but we'd also be hurting
4 people, hurting our economy, and really
19:08:23 5 destroying a lot of natural resources. And
6 it's really not fair. Now, somebody might look
7 at this and they'll say, well, god, that's
8 Africa, that's Nigeria. Well, maybe somewhere
9 right now in Texas somebody is saying, That's
19:08:37 10 the West Coast, Oregon. They're just a bunch
11 of hicks out there. It's a small town.

12 And we're not. It's like that's how we're
13 being treated. I feel like we're being bought
14 off in a lot of ways. NorthernStar comes in
Page 19

PM6 RN-110807-FERCpm.txt		
PM6-2 cont'd	19:08:50	15 and they give money to local charities, a
		16 little trickle here and a little trickle there,
		17 and they're not treating us fair. We're being
		18 treated like second-class citizens, like peons,
		19 and we don't appreciate it.
	19:09:03	20 We are bright, intelligent people, and
		21 there are local jobs. People can come back
		22 here and get jobs that are being created as we
		23 speak. I've lived here all my life. I feel
		24 like I have a perfectly good job. I'm a
	19:09:17	25 third-grade teacher at Astor School, and I
		24
	19:09:20	1 would hate to think of the danger that there
		2 could be as those horrible tankers are passing
		3 by the playground where so many children are
		4 playing. And that's my statement.
	19:09:30	5 Thank you very much.
		6 MR. FRIEDMAN: Thank you.
		7 Next is Ned Heavenrich.
		8 MR. NED HEAVENRICH: Good evening. Ned
		9 Heavenrich, and that's as in where you want to
	19:09:51	10 go and what you want to be, heaven and rich
		11 together. Saves a lot of spelling.
		12 It's my privilege to work in this building
		13 right here, and I am not in favor of this
PM6-3		14 project, and one of the reasons -- I have many
	19:10:13	15 reasons. One of the reasons is because of the
		16 dredging. There's a great picture here of the
		17 amount of dredging that will be done in the
		18 turning basin, 700,000 cubic yards of material,
		19 enough to fill dump trucks that would reach
		Page 20

Public Meetings

6

PM6-3 Dredging is addressed in sections 4.2 and 4.3 of the EIS.

PM6-3 cont'd

PM6-4

PM6-5

PM6 RN-110807-FERCpm.txt

19:10:33 20 from Longview, Washington, to the

21 Oregon-California border. That's a lot of

22 material.

23 And when I first came to this area in

24 1973, it was on the deck of a fishing boat.

19:10:47 25 And I'm very concerned -- I've seen the

□

19:10:51 1 degradation of the river over the years, the

2 decline in the salmon. We have a lot of

3 endangered, threatened species, and to allow

4 another project like this is just going to

19:11:02 5 continue on the road to further degradation of

6 the resource that is so precious: The icon of

7 the Pacific Northwest, the salmon. And just in

8 30 years I've seen it go from, you know, an

9 abundant amount of fish to a trickle.

19:11:23 10 And so I'm sure that you've looked at this

11 on the Environmental Impact Statement, and I

12 just want to say that to allow this to happen

13 would be another tragedy and not healthy for

14 the environment here in Clatsop County.

19:11:43 15 Thank you.

16 MR. FRIEDMAN: Thank you.

17 Next is Ted Messing.

18 MR. TED MESSING: I'm Ted Messing.

19 M-E-S-S-I-N-G. I'm 35-year resident of Clatsop

19:12:10 20 County and a former commercial fisherman.

21 After following these proposed LNG

22 projects for three years, during which we have

23 attended nearly every federal, state, and

24 county meeting, I have my doubts that anything

Page 21

Public Meetings

6

PM6-4 The project's potential impact on salmonids is discussed in sections 4.5 and 4.6 of the EIS. We will also address this issue in our revised BA and EFH Assessment.

PM6-5 Public meetings are part of the NEPA process.

PM6 RN-110807-FERCpm.txt

PM6-5
cont'd

19:12:22 25 I could say here today will make much
□ 26

19:12:25 1 difference. I am sure the main purpose of this
2 meeting is so you can check the box that says
3 you held a public meeting.

PM6-6

4 However, the consensus outside the bubble
19:12:34 5 is that this project is a bad idea. The
6 Bradwood site and the head of Clifton Channel
7 is an incredibly sensitive area for all
8 Columbia River salmonids. It is the gateway to
9 their estuary.

19:12:49 10 The dredging involved will completely
11 destroy the natural shallow-water entrance to
12 the entire downstream estuary ecosystem.
13 Changing river currents will wash away fragile
14 islands, all of which are part of a wildlife
19:13:04 15 refuge. This disruption of a natural path to
16 the estuary of the 13 endangered salmonid
17 species will be a daily occurrence. Dredging,
18 tugs turning massive tankers, millions of
19 gallons of river water sucked up for ballast
19:13:21 20 does not seem healthy for salmonids.

21 The LNG industry says they can mitigate
22 for this destruction, but how do you mitigate
23 for a river that has been turned into an
24 industrial ditch? Mitigation is a pathetic
19:13:34 25 attempt to restore what we already have after
□ 27

19:13:36 1 it has been damaged or destroyed. And if
2 mitigation is so good, why are we literally

Page 22

Public Meetings

6

PM6-6

Based on the results of modeling conducted by WEST, dredging of the maneuvering area and berth are unlikely to modify flow velocities within the river such that the destruction of the entrance to the lower Columbia River estuary or erosion of entire islands would result.

Potential impacts from dredging and water intake on aquatic resources are discussed in section 4.5.2.1. Potential impacts from tug maneuvering are discussed in section 4.1.3.3.

The adequacy of mitigation for impacts on aquatic resources due to the project is discussed in the response to comment FA2-10.

PM6-6
cont'd

PM6 RN-110807-FERCpm.txt
 3 fighting over the last salmon now, and 13 out
 4 of 16 runs are threatened or endangered?
 19:13:47 5 There could not be a worse site on the
 6 entire West Coast to put an industrial gas
 7 terminal and tank farm than Bradwood. I am
 8 submitting three testimonies given at the
 9 Clatsop County zone change hearing to support
 19:14:01 10 our objection.
 11 Number one testimony is by Lee Cain,
 12 fisheries biologist about the importance of
 13 protecting the estuary. Number two testimony
 14 is by Hobe Kyter of Salmon For All, as to the
 19:14:17 15 negative impacts on our commercial river
 16 fisheries. And the third one is the Clatsop
 17 County planning staff report itself,
 18 recommending denial of the zone change requests
 19 for Bradwood.
 19:14:31 20 In spite of the heavily influenced and,
 21 therefore, illegal vote in favor of zone
 22 changes by some of the planning commissioners,
 23 the staff report is good science on the
 24 consequences of this project and its
 19:14:44 25 noncompliance with zoning laws. I have
 □
 19:14:46 1 included the web site at which the report can
 2 be read, and I also understand that it's
 3 already been submitted.
 4 So I'm just asking, surprise us. Don't
 19:14:54 5 let this cancer get started in our estuary.
 6 Thank you.
 7 MR. FRIEDMAN: Thank you for your

28

Public Meetings

8 PM6 RN-110807-FERCpm.txt
 comments.
 9 I think it's Georgia Macencourt? Not
 19:15:23 10 close? Please fix it.
 11 MS. GEORGIA MARINCOVICH: Not even close.
 12 MR. FRIEDMAN: I'm sorry.
 13 MS. GEORGIA MARINCOVICH: It's Georgia
 14 Marincovich. M-A-R-I-N-C-O-V-I-C-H.
 19:15:30 15 MR. FRIEDMAN: I apologize.
 16 MS. GEORGIA MARINCOVICH: I am a landowner
 17 in Clifton. (Pause.) My husband said I'd be
 18 too emotional, but I'm going to do it anyway.
 19 We're right next to Bradwood, and it's a
 19:15:49 20 fishing village, and we've fished there for a
 21 hundred years. And my fear is that they're
 22 going to build this horrible project here and
 23 they'll destroy the wetlands.
 24 MR. FRIEDMAN: Georgia, do you want to
 19:16:10 25 wait and come later?
 □ 29
 19:16:12 1 MS. GEORGIA MARINCOVICH: No, I want to
 2 finish. Thank you.
 3 And that these wetlands, they say they can
 4 replace them by mitigation. There is no way
 19:16:20 5 that these wetlands can be replaced. And my
 6 question is this: You have -- we have all
 7 these environmental regulating agencies, and we
 8 don't hear from any of them. You ask them
 9 about the project, and they say we cannot
 19:16:40 10 comment. Who's protecting the environment?
 11 They can't comment on something as big as this?
 12 I want to just read the agencies off.

Public Meetings

6

PM6-7

We address impacts on wetlands and mitigation in section 4.4.1. NorthernStar will have to obtain permits from the COE, ODSL, and WDE, and those permits would contain conditions to mitigate for any wetland losses. The FERC has consulted with the FWS and NMFS about impacts on marine mammals, aquatic resources, and threatened and endangered species, and has produced a BA and EFH assessment. The FWS, NMFS, and ODFW have all commented about this project on the record. Their comments on our draft EIS can be found in volume 2 of the final EIS under FA2, FA4, and SA1. This EIS discloses environmental impacts and includes recommended conditions to protect resources.

PM6-7
cont'd

PM6 RN-110807-FERCpm.txt
Are the laws? 404 of the Clean Water Act,
the Magnuson-Stevens Fishery Conservation and
Management Act, the Fish and Wildlife
Conservation Act, the National Environmental
Policy Act, the Rivers and Harbors
Appropriation Act of 1899, the Endangered
Species Act, the NOAA Fisheries Services
Activities Related to Wetlands Policy and
Guidance, the National Marine Fisheries
Service, the Pacific Fisheries Management
Council, the Oregon Fish and Wildlife, the
Washington Department of Fish and Game.
Where are all these agencies that are
supposed to protect the fish? And also your
department. You're also supposed to be
protecting the environment.
(Applause.)
MR. FRIEDMAN: Thank you for your
comments.
I do understand that this is an emotional
issue. It affects people deeply, and they have
very strong opinions, but I am going to ask you
again to not applaud, not boo, just be neutral.
Thanks.
I hope to do better pronouncing your
husband's name. Jack Marincovich.
UNIDENTIFIED SPEAKER: Mr. Friedman, it's
hard to hear in the back. Is it possible to
turn it up?
MR. FRIEDMAN: I don't know how. If I put

Page 25

30

Public Meetings

PM6-8	18	PM6 RN-110807-FERCpm.txt it closer to my face, is it better?	
	19	UNIDENTIFIED SPEAKER: Yes.	
	19:18:39 20	MR. JACK MARINCOVICH: Mr. Chairman, my	
	21	name is Jack Marincovich. I'm a commercial	
	22	fisherman on the river and also representing	
	23	the Columbia River Fishermen of Astoria.	
	24	Our organization is well over a hundred	
	19:18:52 25	years old. We represent the interests of	31
	19:18:55 1	commercial fishermen on the Columbia River.	
	2	There's roughly 500 commercial fishermen that	
	3	participate on the Columbia River. We come	
	4	from three and four generations of fishermen.	
	19:19:08 5	They spend most of their time on the Columbia	
	6	River, so they like to believe they know what's	
	7	good and what's bad for the Columbia.	
	8	I've been following this for the best part	
	9	of three years. I went to the first open house	
	19:19:20 10	in Bradwood, and we talked with people there,	
	11	and we've been going to meetings ever since. I	
	12	testified at the mark (inaudible) deal. I	
	13	testified at the meeting at the Astoria High	
	14	School in the first part of July, I think it	
	19:19:34 15	was, along with 200 other people, and I think	
	16	two-thirds spoke against the project. We had	
	17	good testimony, professional people.	
	18	But for some reason all that testimony was	
	19	pushed under the table and it was -- it was --	
	19:19:51 20	it was discarded, wasn't even used, and that	
	21	really, really turned me off on the process of	
	22	public input, you know. So I've come to the	
Page 26			

Public Meetings

6

PM6-8 We address impacts on wetlands and mitigation in section 4.4.1. Hunt Creek is discussed in section 4.3.2.3. NorthernStar's mitigation plan would protect the habitat of Hunt Creek, and restore wetland environments in the lower Columbia River estuary. Impacts on fishing are addressed in section 4.7.1.4 and 4.8.1.7. We do not think that the project would result in significant adverse effects on commercial or recreational fishing.

PM6-8
cont'd

23 PM6 RN-110807-FERCpm.txt
conclusion that I think the project is a
24 bigger -- is a bigger task, it's a bigger deal
19:20:11 25 than our county people handle and make 32
□

19:20:15 1 decisions.
2 I just -- sorry -- elected officials,
3 Clatsop County Commissioners, we elected them,
4 we voted them in, but right now I think it's
19:20:25 5 too big of a task for them to judge. I
6 think -- we've got all these federal agencies
7 that -- I know our commercial fishing seasons,
8 most of our seasons and regulations come down
9 from National Marine Fisheries. They hand down
19:20:40 10 the regulations to the states.
11 And then we have meetings, and they decide
12 when we can work on the river and when we can't
13 work on the river. We have Endangered Fishing
14 Act -- Fish Species Act. There's certain fish
19:20:56 15 we can catch, certain fish we can't catch.
16 They stop us, on our line they stop us. I'm
17 just waiting for these agencies, these federal
18 agencies -- we have a list of them here: Clean
19 Water Act, Magnuson Act, Fish and Wildlife
19:21:09 20 Conservation Act, National Environmental Policy
21 Act, Rivers and Harbors, Endangered Species.
22 All these federal agencies that have more
23 to say about what goes on the rivers than
24 county commissioners or county planning
19:21:25 25 commission. And I'm waiting for them to step 33
□

19:21:27 1 in because they're the ones that curtail our
Page 27

Public Meetings

PM6-8

PM6 RN-110807-FERCpm.txt

2 operations, and go back to Bradwood Landing.
3 We grew up in Clifton. About a dozen families
4 still own property.
19:21:41 5 Very few days through the year I don't
6 drive down the county road. My dad's house is
7 still there. We spend most of all our time
8 there. We work there. We play there. We do
9 fishing. We do hunting in the area. It's more
19:21:54 10 than -- it's more than just a way of making a
11 living through the years and our people behind
12 us; it's a way of life.
13 And the wetlands in Bradwood Landing,
14 we've been through them, you know, all through
19:22:08 15 the years and --
16 MR. FRIEDMAN: Jack, can you wrap it up.
17 MR. JACK MARINCOVICH: Okay. Hunt Creek
18 runs down through wetland, and it's too
19 valuable of a wetland, and it can't be
19:22:19 20 mitigated downstream anyplace. If those
21 wetlands are destroyed, they can't be replaced
22 anyplace else.
23 So thank you for the time, and we'll catch
24 you at the next meeting.
19:22:30 25 (Laughter.)
□

34

19:22:32 1 MR. FRIEDMAN: Thank you for your
2 comments.
3 Brent Foster.
4 MR. BRENT FOSTER: Good evening. Thanks
19:22:47 5 for the opportunity. My name is Brent Foster.
6 I'm speaking on behalf of Columbia Riverkeeper.
Page 28

Public Meetings

PM6 RN-110807-FERCpm.txt

PM6-9 7 I'm executive director of Columbia Riverkeeper.

19:22:59 8 And in many ways I think that the EIS
9 reads more like a promotional document than a
10 candid assessment of what this project might
11 actually do. I understand that the political
12 push that has resulted in what I'd call the
13 rush to develop LNG terminals, put strong
14 pressure on FERC to, let's say, look more
19:23:13 15 favorably on high-impact facilities like
16 NorthernStar's Bradwood project, but
17 fortunately enough, NEPA and other federal laws
18 still apply, and this EIS simply does not meet
19 them.

19:23:26 20 I'm going address -- we're preparing
21 detailed comments which we'll be submitting
22 before the deadline, but I'll just touch on two
23 issues today, both the EIS's failures in terms
24 of evaluating the project's effect on salmon
19:23:39 25 and, secondarily, on people, two things that I
□

35

19:23:41 1 think are extremely important to this
2 community.

PM6-10 3 As a starting point, on salmon, the EIS is
4 completely unrealistic. It essentially is
19:23:51 5 painting a very rosy picture of what putting a
6 major industrial port in the middle of the
7 United States lower 48's best terrain salmon
8 runs. It not only downplays the very specific
9 effects of the LNG terminal but, frankly, is
19:24:09 10 not comprehensive of the fact that there is an
11 actual salmon crisis going on. Virtually
Page 29

Public Meetings

6

PM6-9 See our responses to comments PM2-20 and PM4-20,

PM6-10 See our response to comment FA1-28.

		PM6 RN-110807-FERCpm.txt	
PM6-10 cont'd	12	ignores the biological opinion process which	
	13	has now been rejected multiple times by a	
	14	federal judge in which the federal government	
	19:24:21 15	is an intimate player.	
	16	The Columbia River estuary, in those	
	17	discussions, which have resulted from	
	18	litigation over the operation of the Columbia	
	19	River main stem, is specifically focused from	
	19:24:32 20	the federal government, of which you're a part,	
	21	on banking basically the future of Columbia	
	22	River salmon largely on the success of the	
	23	Columbia River estuary.	
	24	This EIS completely ignores, I think, the	
	19:24:46 25	importance, how this is going in a very	36
PM6-11	19:24:49 1	direction than another arm of the federal	
	2	agency, which I get to hear in court on a	
	3	regular basis, talking about how the estuary	
	4	and improvements here are going to be the	
	19:24:57 5	solutions to the Columbia's hydropower system.	
	6	Specifically, the EIS grossly downplays	
	7	the effects of several billion, not million,	
	8	gallons of ballast water withdrawal thanks to	
	9	the unproven, never tested, never even built,	
	19:25:13 10	let alone prototyped or proven methods of	
	11	putting ballast water in ships using fish	
	12	screens. The EIS is optimistic, but blindly	
	13	so.	
	14	It unreasonably assumes that mitigation	
	19:25:27 15	measures are going to work. It ignores the	
	16	fact that central components of NorthernStar's	
		Page 30	

Public Meetings

6

PM6-11 We have recommended in section 4.4.1.2 that NorthernStar's final Compensatory Mitigation Plan be filed, along with agency comments and appropriate approvals, with the Secretary prior to construction of the project. We do not feel that it is unreasonable to assume that agency-approved mitigation measures would be effective. The fact that another entity had offered to purchase Svensen Island prior to NorthernStar is not relevant to the discussion of potential impacts from the Bradwood Landing Project.

NorthernStar submitted its Mitigation Plan – 3rd Revision for the Bradwood Landing Terminal and Pipeline to the FERC on August 3, 2007. This document is available for viewing by the public on the FERC's Internet web page at www.ferc.gov, through the eLibrary link, selecting "General Search," entering the docket number minus the last three digits (i.e., CP06-365), and putting in the proper date range.

		PM6 RN-110807-FERCpm.txt	
PM6-11 cont'd	17	mitigation, like the Svensen Island purchase,	
	18	are essentially little more than a sham.	
	19	Svensen Island was about to be purchased by	
	19:25:41 20	Columbia Land Trust, although this is ignored	
	21	by the EIS, and prior to the finalization of	
	22	the purchase, NorthernStar came in, offered a	
	23	higher price; next thing you know, it's	
	24	mitigation.	
	19:25:52 25	It was going to be already bought and	37
PM6-12	19:25:54 1	purchased. It's completely inappropriate to	
	2	consider as mitigation since essentially this	
	3	is the project, and NorthernStar is the company	
	4	which stored it as conservation benefit.	
	19:26:04 5	Impacts on salmon stranding are also just cast	
	6	aside.	
	7	I want to address quickly three points on	
	8	people. We are going to echo Dr. Havens'	
	9	testimony in regard to FERC's use of the	
	19:26:19 10	incorrect model. In evaluating, it's very	
	11	important you portray a clear picture of what a	
	12	tanker breach of a tanker passing Astoria in	
	13	Puget Island would actually mean in terms of	
	14	lost lives, in terms of damaged structures and	
	19:26:33 15	economic damage to infrastructure.	
	16	Relying on Sandia's estimate no longer	
	17	makes sense because the GAO clearly says Sandia	
	18	likely underestimates the actual effect of a	
	19	cascading failure due to one rupture in one	
	19:26:49 20	tank, you're likely to lose -- or at least	
	21	there's good reason to believe you'd lose the	
		Page 31	

Public Meetings

6

PM6-12 Section 4.11.5.3 discusses the hazards associated from a release of LNG from an LNG carrier. Section 4.11 includes a discussion of cascading failures from LNG tanks on an LNG carrier.

PM6-13

PM6 RN-110807-FERCpm.txt

22 whole tanker. With that I'll wrap up my
 23 comments and look forward to submitting them in
 24 the final.

19:26:59 25 MR. FRIEDMAN: Thank you. 38

19:26:59 1 Next speaker is Jerry Havens.

2 DR. JERRY HAVENS: Thank you for
 3 permitting me to comment at this meeting. I'm
 4 appearing as a scientist and as a concerned
 19:27:18 5 citizen to inform you of potential problems in
 6 FERC's approval of vapor cloud exclusion zones
 7 prepared for the Bradwood Landing DEIS.

8 Recent events indicate to me that FERC's
 9 compliance with the Congressional mandate to
 19:27:35 10 consider remote siting of LNG terminals in
 11 order to protect public safety is being based
 12 largely on exclusion, or safety, zones required
 13 by the U.S. Department of Transportation
 14 regulation 49 CFR 193. As a result, the
 19:27:51 15 establishment of such exclusion zones, which
 16 are mandated for land-based facilities only,
 17 has become the key method by which the
 18 sufficiently remote siting is insured. I
 19 believe that such methods as are presently
 19:28:05 20 applied do not and cannot insure the public
 21 safety as intended.

22 In the limited time available, I'll
 23 comment only on the vapor cloud exclusion zone
 24 determination.

19:28:17 25 Presently, only two modeling methods are 39

PM6 RN-110807-FERCpm.txt

PM6-13
cont'd

19:28:19 1 approved for determining vapor cloud exclusion
 2 zones. The DEGADIS model, of which I am a
 3 co-author, was developed with the support of
 4 the U.S. Coast Guard and the Gas Research
 19:28:30 5 Institute. Approved for use in the federal
 6 regulation in the early '90s, DEGADIS does not
 7 account for any holdup of LNG vapor by dikes or
 8 other obstructions.
 9 Because of the need for models which can
 19:28:45 10 account for such complicated effects, the FEM3A
 11 model was developed as a result of a
 12 ten-year-long research effort supported by the
 13 Gas Research Institute and a consortium of
 14 international LNG interests, for which I was
 19:28:58 15 the principal investigator. FEM3A, approved in
 16 the year 2000, is clearly specified in 49 CFR
 17 193 as the model that must be used if vapor
 18 cloud holdup by impoundment is to be taken into
 19 account.
 19:29:17 20 Here, the Bradwood Landing applicant
 21 attempts to take the vapor holdup effect of the
 22 impoundment into account without using the only
 23 permissible method, FEM3A, for doing so.
 24 Instead it uses DEGADIS coupled with an absurd
 19:29:38 25 assumption that the LNG vapor evolved from a
 □
 19:29:40 1 spill would accumulate in the impoundment
 2 without mixing with air. In effect, the
 3 applicant assumes that zero LNG vapor would be
 4 released from the impoundment during the first

40

PM6-13 cont'd

19:29:51 5 PM6 RN-110807-FERCpm.txt
several critical minutes after a spill, when

6 the rate of vapor generation is the greatest.

7 This assumption has the effect of

8 substantially reducing the calculation of the

9 size of the vapor exclusion zone. Most

19:30:03 10 importantly, the assumption has been proven to

11 be wrong. Experiments have conclusively shown

12 that the LNG vapor does not simply remain

13 unmixed and unwarmed until it fills up and

14 overflows the impoundment.

19:30:18 15 However, that absurd and demonstrably

16 wrong assumption is the basis for the

17 calculation of the vapor exclusion zone in this

18 case. To be reasonable, this must be redone

19 either using negatives without attempting to

19:30:31 20 take the effect of the vapor holdup, or by

21 using FEM3A.

22 I believe that the vapor cloud exclusion

23 zones determined in the DEIS fail to provide

24 for public safety as intended by 49 CFR 193 in

19:30:46 25 two other ways, briefly:

□

19:30:48 1 The design spill used by the applicant

2 here has been arbitrarily specified as the

3 breakage of a six-inch line on the cargo

4 unloading line for the facility, with a

19:31:00 5 ten-minute duration spill of 140,000 gallons,

6 while the impoundment volume into which the

7 spill would occur has been sized to account for

8 530,000-gallon spill.

9 My review of 11 other environmental impact

Public Meetings

PM6-13 19:31:16 10 PM6 RN-110807-FERCpm.txt
 cont'd 11 statements shows DEIS approval for design spill
 12 from the ship unloading line ranging from
 13 29,000 gallons to 810,000 gallons. I do not
 14 understand how FERC can approve such a large
 15 variation in the design spill which determines
 19:31:36 16 the extent of the exclusion zone. After all,
 17 the ship unloading lines, as well as the
 18 arrangement of the smaller lines serving the
 19 unloading line, are all based on similar
 20 technology.
 19:31:48 21 Since the vapor cloud's own determinations
 22 are directly related to the size of the spill,
 23 it could have the appearance of simply
 24 determining the size of the spill that the
 25 property distance allows.
 19:32:01 26 MR. FRIEDMAN: Dr. Havens, please wrap it
 19:32:04 1 up, and we need to see it in writing because
 2 it's a complex issue.
 3 DR. JERRY HAVENS: The determination of
 4 the vapor cloud exclusion zone has been made
 19:32:10 5 assuming a wind speed of two meters per second.
 6 This assumption is not conservative, although
 7 it's allowed by 49 CFR 193. Models and
 8 experiments indicate that the worst case is at
 9 a higher wind speed. In this regard, I point
 19:32:25 10 out in closing the fire radiation exclusion
 11 zone is required to be determined by FERC, and
 12 Bradwood Landing appears to have done so for
 13 the wind speed that maximizes the exclusion
 14 zone. The same reasoning is applicable to the

Public Meetings

Public Meetings

6

K-267

19:32:41 15 PM6 RN-110807-FERCpm.txt
termination of the vapor cloud exclusion zone.

16 Thank you.

17 MR. FRIEDMAN: Thank you for your

18 comments.

19 (Applause.)

19:32:47 20 MR. FRIEDMAN: I expect if you have more
21 detailed comments, that you'll send us another
22 letter, much more detailed.

23 DR. JERRY HAVENS: I'm sorry?

24 MR. FRIEDMAN: If you have more detailed
19:32:55 25 comments, you can send those in as well.

43

19:32:58 1 DR. JERRY HAVENS: I'm done.

2 MR. FRIEDMAN: Next is Carolyn Eady.

3 MS. CAROLYN EADY: My name is Carolyn

4 Eady, E-A-D-Y.

PM6-14 19:33:14 5 I'm opposed to the Bradwood Landing, and
6 my comments regarding the DEIS are as follows:
7 First, omissions. You have a table there,
8 that's actually a map, figure 4.7.1-1, page
9 4-276: Sensitive resources along the waterway.

19:33:33 10 It omits Station Camp and Dismal Nitch and part
11 of the Lewis and Clark National Historic Park;
12 the Astoria bridge connecting Oregon and
13 Washington; Clatsop County parks on or near the
14 Columbia River, including the John Day boat

19:33:50 15 ramp, a very popular one, the Westport boat
16 ramp, and the Big Creek Park; the Oregon
17 Department of Forestry campground and trail at
18 Gnat Creek; the City of Warrenton trails along
19 the Columbia River; the City of Astoria river

Page 36

PM6-14 Figure 4.7.1-1 depicts potential sensitive resources within the Zones of Concern. We have added to the figure the features listed in this comment that are within the Zones of Concern. However, Station Camp, Dismal Notch, Westport boat ramp, Big Creek Park, and the Gnat Creek campground and trail are located outside of the Zones of Concern.

PM6-15	19:34:04	20	PM6 RN-110807-FERCpm.txt walk.	
		21	In addition, it omits the frequency of	
		22	floods in northwest Oregon. There have been	
		23	five over the past 150 years. They usually	
		24	close the Columbia River and have freighters	
	19:34:16	25	lined up all along the waterfront. It should	44
	19:34:20	1	also be noted that ODF reported the flood of	
		2	'96 -- 1996 caused thousands of shallow,	
		3	rapidly moving landscapes.	
PM6-16		4	You omit the frequency in which the Coast	
	19:34:32	5	Guard closes the bar at the mouth of the	
PM6-17		6	Columbia River due to extreme weather. You	
		7	omit the fact that the URS geological hazard	
		8	report -- they mention, in fact, in the DEIS,	
		9	we should feel okay about the pipeline because	
	19:34:51	10	California has not had a major failure in the	
		11	last 60 years.	
		12	The URS report mentions specifically that	
		13	the only failure was in Alaska during their 9.2	
		14	earthquake. I think that's a significant	
	19:35:08	15	omission in the DEIS. A level-nine earthquake	
PM6-18		16	is 30 times stronger than a level seven, and	
		17	they had not experienced a level nine in	
		18	California during those years.	
		19	There's a statement -- this is more in the	
	19:35:27	20	case of an error: An earthquake associated	
		21	with a portion of the Cascadian subduction zone	
		22	in northwest Oregon and southwestern Washington	
		23	has not occurred in historic time, page 4-11.	
		24	I'm baffled by that statement. We can	
			Page 37	

Public Meetings

6

- PM6-15 As indicated in section 2.1.2.4, the anchorages at Astoria would not be suitable for use by LNG vessels. Therefore, if the Columbia River is closed to ship traffic due to flooding (or other poor weather conditions), LNG ships would not be allowed to enter the river. Loaded LNG ships would not anchor at Astoria. Landslides are addressed in section 4.1.
- PM6-16 Section 2.1.2.2 describes wave hazards and storm conditions at the Columbia River Bar, including conditions that do not allow transit by ships.
- PM6-17 California is referenced as it is a very active seismic region and therefore illustrates how well natural gas pipelines perform under such conditions.
- PM6-18 In the seismic hazard analysis report for LNG terminal, the phrase "historic time" refers to the period from 1850 to the present. That is time period during which reasonably complete earthquake records are available. This has been clarified in the final EIS. In addition, we have added information regarding past large subduction zone earthquakes and the event of 1700 was taken into account in assessing the site-specific risk at the site..

PM6-18 19:35:44 25 PM6 RN-110807-FERCPm.txt
 □ give you the exact dates going back thousands 45
 cont'd

19:35:47 1 of years, including the last one, January 26,
 2 1700. We are 307 years into a 300- to 500-year
 3 range of having major earthquakes. A local
 4 geologist estimates our risk of such an
 19:36:08 5 earthquake at 15 to 20 percent. I cannot
 6 understand -- and I'll give you these
 7 comments -- how they came up with the figures
 8 they did.
 9 This is not an academic exercise for
 19:36:22 10 people who live here. This research that's
 11 developed over the last 20 years has changed
 12 everything, including building codes,
 13 education, signage, escape routes, you name it.
 14 The final comment --
 19:36:37 15 MR. FRIEDMAN: Please wrap it up.
 PM6-19 16 MS. CAROLYN EADY: I'll wrap it up. The
 17 hazards associated with the pipeline, they
 18 identify them, but they never looked at the
 19 compounding effect that a major earthquake
 19:36:48 20 would have on an area that is already hazardous
 21 and subject to landslides and faults.
 22 Thank you.
 23 MR. FRIEDMAN: Thank you for your
 24 comments.
 19:37:01 25 Next is Joseph -- and correct me if I
 □ 46

19:37:05 1 mispronounce it -- Boehm.
 2 MR. ROBERT BOEHM: I think you're talking
 3 Bob Boehm. That's all right.
 Page 38

Public Meetings

6

PM6-19 Geologic hazards are grouped in categories in the EIS for organizational purposes. While it is true that some hazards could occur simultaneously and may be interrelated (e.g., flooding and landslides or earthquakes and landslides), the existing descriptions are still valid and the mitigation measures are the same. Site-specific slope stability evaluations to be performed prior to construction along the pipeline route must take earthquake effects into account.

PM6 RN-110807-FERCpm.txt

4 MR. FRIEDMAN: All right. Please correct
19:37:19 5 me.

PM6-20

6 MR. ROBERT BOEHM: My name is Bob Boehm,
7 spelled B-O-E-H-M. I live approximately a mile
8 and a half from Clifton, and I'd like to
9 address the security problems at the site
19:37:32 10 itself.

11 I may not be a terrorist, but I am a
12 hunter, and unless they plan on defoliating a
13 thousand yards around the whole perimeter of
14 that area, any terrorist could sit up in the
19:37:46 15 woods and lob bombs in that area all day long.

16 It is one of the worst places to have an LNG
17 terminal, just because the location. There are
18 hills surrounding the east side and the west
19 side, and it's -- and it's very heavily wooded,
19:38:05 20 and anyone could sit up there and just raise
21 havoc with it.

PM6-21

22 And the second problem I have with the
23 project is that I've lived in Clifton probably
24 approximately 40 years, and I have seen the
19:38:21 25 amount of rain that we have in the area, and

47

19:38:27 1 you could say that coming down Clifton Road in
2 the middle of wintertime is at times horrific.
3 And all the little tributaries that run into
4 Hunt Creek, a lot of times we have so much
19:38:39 5 rain, it overfills the culverts and it spills
6 right across the road.

7 And if there was ever a spill -- and when
8 I read, there's going to be approximately at
Page 39

Public Meetings

6

PM6-20 Section 4.11.8 discusses terrorism and security issues. As stated in that section, it is possible that a release from the LNG storage tanks could be caused by an intentional act, such as a terrorist attack. Although an intentional breach scenario could result in greater thermal radiation in the immediate vicinity of the release, such scenarios are typically associated with the desire to inflict damage to major infrastructure and population and commercial centers.

PM6-21 As described in section 4.11.3, the LNG storage tanks at the Bradwood Landing terminal are double-walled tanks so that the contents of the inner tank would be contained in the event of a failure. In addition, a tertiary berm surrounding the tank and processing area would provide further spill containment in the event of an unforeseen catastrophic failure. Therefore, it is highly unlikely that a spill would flow into Hunt Creek.

Public Meetings

6

PM6 RN-110807-FERCpm.txt

PM6-21
cont'd

9 times a thousand trips a day up and down that
10 Clifton Road for this LNG terminal. And if
11 there is a spill, and odds are there probably
12 will be, and if it happens in the winter, there
13 is no way that there will be any type of
14 emergency vehicles to get to that spill,
15 because it will run right into Hunt Creek and
16 right into the estuary, and then you'll have a
17 problem, a real big problem.
18 And I don't think any of this has been
19 addressed. It's really nice to see it in the
20 summertime when there's no rain, but in the
21 wintertime, when we have snow and everything
22 else, and they'll be working, what, 24/7, and
23 there will be problems. And then what?
24 And really the only reason, in my opinion,
19:39:37 25 that it is put in that area is because they

48

19:39:41 1 figure it was out of sight, out of mind, and
2 what would happen would happen. And the people
3 that live on Puget Island and in Brownsmead and
4 Clifton, we're kind of disposable, and that's
19:39:53 5 the way I feel about it.

PM6-22

6 And also one other thing. I feel really,
7 to be quite candid with you people, this is
8 nothing but a big facade, and it's been kind of
9 shoved down our throat. They throw a little
19:40:06 10 money around, and you people -- I don't know
11 you, but this is the way I see it. People go
12 like that with their hands (indicating) and
13 it's a done deal. And I -- and I don't know if

Page 40

PM6-22 See our response to comment PM2-3.

PM6 RN-110807-FERCpm.txt

PM6-22

cont'd

14 it's a done deal, but a lot of people tell me
 15 it's a done deal.
 16 That's all I have to say.
 17 MR. FRIEDMAN: Thank you for your
 18 comments.
 19 Next is Cheryl Johnson.

19:40:39 20 MS. CHERYL JOHNSON: Cheryl Johnson,
 21 Astoria, Oregon.

PM6-23

22 What changes are necessary to allow a
 23 private company access to the Columbia River
 24 for the purpose of making a profit for its
 19:40:48 25 shareholders? In examining the DEIS, a number

49

19:40:50 1 of disturbing questions emerged. The WSR
 2 recommends facilities and infrastructure to
 3 make the waterway suitable for LNG marine
 4 traffic. These are listed on page 4-432.
 19:41:03 5 Among them, quote: Augmentation of shoreside
 6 firefighting capabilities to provide protection
 7 services to the facility as well as the
 8 communities along the transit route and, quote,
 9 shoreline patrols.

19:41:18 10 Continuing on page 4-433, the DEIS refers
 11 to additional measures that may include, quote:
 12 Security boardings, surveillance and
 13 monitoring, patrols, vessel escort and
 14 additional security measures. The DEIS makes
 19:41:31 15 repeated reference to such facilities and
 16 infrastructure. Here comes the problem.
 17 Quote: Because any unauthorized disclosure of
 18 the details of these measures could be employed

Page 41

Public Meetings

6

PM6-23 As discussed in section 4.11.6, the ERP must be developed in consultation with appropriate federal, state, and local agencies. The plan would be available to the local agencies and emergency personnel who need the information to ensure public safety. Non-SSI components that are necessary for public involvement, such as emergency notification or evacuation route information, would be made public as appropriate.

Public Meetings

6

PM6-23 cont'd

PM6 RN-110807-FERCpm.txt

19:41:46 19 to circumvent proposed security measures, it is
20 not releasable to the public, page 4-433.
21 Problem number one: We, the communities
22 that will be directly affected, cannot know
23 what safety and security measures will be
24 required. The plan is secret.

PM6-24 19:41:59 25 On page 5-17 the EIS references another 50
19:42:03 1 problem, costs of these requirements. Quote:
2 An issue that has developed for several LNG
3 terminal projects, including Bradwood Landing
4 project, is a concern that local communities
19:42:14 5 would have to bear some of the costs of
6 insuring the security emergency management of
7 the LNG facility and the LNG vessel while in
8 transit and unloading at the dock.
9 Here comes the problem. Quote: The
19:42:28 10 specific security emergency management costs
11 for the proposed project are not yet available.
12 Page 5-17. Problem number two: Nobody knows
13 what these safety and security measures are
14 going to cost.
19:42:42 15 And now we come to the heart of this
16 issue, who will pay. On page 4-436, quote:
17 The ERP shall include a cost-sharing plan that
18 contains the description of any direct cost
19 reimbursements NorthernStar agrees to provide
19:43:01 20 to any state and local agencies with
21 responsibility for security and safety.
22 Problem number three: What if
23 NorthernStar agrees to pay 10 or 20 percent of
Page 42

PM6-24 As discussed in section 4.11.6, the ERP must include a Cost Sharing Plan which must be approved by FERC before any final approval to begin construction. If the needed resources are not available and properly funded, construction and operation of the project would not be approved by the FERC. Also see our response to comment PM1-1.

PM6-24 24 PM6 RN-110807-FERCpm.txt
 cont'd 19:43:16 25 the safety and security costs required in our communities so that their ships can travel the 51
 19:43:19 1 Columbia River three times a week? Who pays
 2 the remaining 80 or 90 percent?
 PM6-25 3 In conclusion, in the alternative section,
 4 5.1.02, the only alternatives considered by
 19:43:33 5 FERC were those along the coast of Washington
 6 and Oregon. Since the majority of the gas is
 7 clearly headed for California, all California
 8 sites must be considered.
 9 Currently NorthernStar has a proposal for
 19:43:46 10 an offshore site in Northern California.
 11 Wouldn't it make more sense to keep 80 percent
 12 of the gas in California and send 20 percent to
 13 the Pacific Northwest than the current plan to
 14 trash the Columbia River, endanger the citizens
 19:44:02 15 of Washington and Oregon, while using hundreds
 16 of miles of pipeline to send 80 percent to
 17 California?
 18 FERC should include consideration of all
 19 proposed terminals in California before asking
 19:44:15 20 our communities to assume these incredible
 21 burdens for the profit of an individual company
 22 serving the energy needs of California.
 23 Thank you.
 24 (Applause.)
 19:44:26 25 MR. FRIEDMAN: Thank you for your 52
 19:44:27 1 comments.

PM6 RN-110807-FERCpm.txt
Next is James Kodama.

MR. JAMES KODAMA: James Kodama, 1015
Ellen Street, Kelso, Washington.

19:44:46 MR. FRIEDMAN: Spell your last name for
the court reporter, please.

MR. JAMES KODAMA: Kodama, K-O-D-A-M-A.

PM6-26 I read in the paper today that we'd hear
from Jerry Havens on the subject of LNG, so I
spent a few moments on the Internet, and here's
what I found: To believe Mr. Havens' claim
that he is not an LNG proponent or opponent is
to ignore the obvious. He is simply a hired
gun brought in by the project proponents to
scare the bejeebies out of people who aren't
familiar with the details of the project, the
safety record of the industry, or the science
behind LNG.

Mr. Havens would have us believing our
lives in fear, that there is a terrorist hiding
behind every tree and bush in the Pacific
Northwest, just waiting for a chance to get us.

The U.S. Coast Guard is aware of the risk
of the proposed LNG carriers from terrorists as
well as the construction of LNG carriers. The

19:45:47 measures identified by the Coast Guard are
designed to harden the target and make it
difficult for a terrorist to damage an LNG
carrier.

19:45:58 In '04, Sandia National Laboratories
published guidance on risk analysis and safety

PM6-26 Comment noted.

PM6-26
cont'd

7 PM6 RN-110807-FERCpm.txt
8 implications of a large liquified natural gas,
9 LNG, spillover water. The 167-page report has
10 been widely accepted as accurately representing
11 the risk of the LNG spillover water. The
12 report discusses the issues relating to massive
13 spills into the water, and it also discusses
14 the probability of such an event, rather than
15 use the Sandia lab's guidance to analyze their
16 project.
17 The probability of an actual release of
18 LNG is extremely unlikely. In fact, it's close
19 to zero. On the Columbia River, LNGs carry --
20 carriers will be attached to -- tugboats which
21 travel at 12 knots or less. The bottom of the
22 river is mostly sand. Given these factors and
23 the excellent safety records of the pilots, it
24 is extremely unlikely that an LNG carrier would
25 suffer an accident which could reach the cargo
tanks. In fact, to date, there has never been
a significant spill of LNG from any LNG
carrier.
It turns out that Mr. Havens has testified
against the LNG projects across the country.
He has -- was recruited by the mayor of Fall
River, Massachusetts, to oppose the Weavers
Cove LNG. He has filed testimony against Sound
Energy Solutions in Long Beach, California.
And for some people here today, Mr. Havens
should be a familiar face. In '05 an
environmental group opposed Bradwood Landing

54

Public Meetings

PM6-26
cont'd

12 PM6 RN-110807-FERCpm.txt
brought Mr. Havens to Astoria to deliver his
13 fear-mongering stump speech. So I have to
14 wonder, Mr. Havens, who is paying for you to be
19:47:56 15 here tonight? I challenge you to tell us.
16 Despite his testimony, since Mr. Havens
17 made his concerns known to the Secretary of
18 Homeland Security in February of '04, FERC has
19 issued 14 separate final Environmental Impact
19:48:14 20 Statements related to the LNG facilities. I've
21 included this list in my written testimony.
22 Finally, most telling, was a rebuttal I
23 came across on the Weavers Cove project, and I
24 quote: Finally and perhaps most importantly,
19:48:32 25 Dr. Havens is not an expert on the safety and
□
19:48:37 1 security of LNG vessels or the security of LNG
2 terminal facilities. He has no identifiable
3 experience whatsoever in analyzing terrorism
4 events, their effects, their probabilities, or
19:48:56 5 the potential to mitigate such threats.
6 MR. FRIEDMAN: James, can you --
7 MR. JAMES KODAMA: In summary, based on
8 these flaws, Dr. Havens' modeling and criticism
9 based on modeling are erroneous, unreliable,
19:49:11 10 and add nothing though this record. His
11 opinions, which voiced to the Commissioner or
12 Congress are just that, opinions, but opinions
13 nevertheless, unsupported by the scientific or
14 technology -- technical analysis.
19:49:31 15 MR. FRIEDMAN: Thank you for your
16 comments.

55

Public Meetings

PM6 RN-110807-FERCpm.txt
 17 UNIDENTIFIED SPEAKER: May I make a point
 18 of order, sir?
 19 MR. FRIEDMAN: No. You'll have to wait
 19:49:35 20 for your turn to speak, sir.
 21 UNIDENTIFIED SPEAKER: I met this
 22 gentleman at their office. Can you just
 23 clarify whether you're on their payroll or not.
 24 I met him their office.
 19:49:46 25 UNIDENTIFIED SPEAKER: Ex parte, huh?
 □

56

19:49:49 1 MR. FRIEDMAN: Next is Lori Durheim.
 2 Let's be quiet, let the next speakers
 3 speak, please.
 4 MS. LORI DURHEIM: I'm Lori Durheim,
 19:50:00 5 D-U-R-H-E-I-M, from Astoria. And I've been
 6 fighting this for three years since Cal Pine
 7 slithered into town. You know what happened to
 8 Cal Pine.

PM6-27

9 I will address three areas of many
 19:50:18 10 concerns. First, in the DEIS, FERC recommends
 11 that NorthernStar develop an emergency response
 12 plan with a cost-savings plan -- cost-sharing
 13 plan to reimburse the local providers of these
 14 services. Since the local fire, law
 19:50:38 15 enforcement, and rescue departments are
 16 understaffed with inadequate equipment and
 17 funds, I question this. The money is scarce,
 18 and how are they going to do the cost-sharing?

PM6-28

19 Second, in the DEIS, page ES-5, FERC in
 19:50:59 20 part says: We have recommended that
 21 NorthernStar defer construction until surveys

Page 47

Public Meetings

6

PM6-27 See our responses to comments PM1-1 and PM6-24.

PM6-28 See our responses to comments PM2-3 and PM2-20.

PM6-28 22 PM6 RN-110807-FERCpm.txt
 cont'd 23 are completed. This sounds like it's already
 24 been a fast track to approval. NorthernStar is
 in like flint.

PM6-29 19:51:19 25 Third, the noise during construction, as 57
 □

19:51:22 1 stated on page ES-5, could occur up to 24 hours
 2 per day, seven days a week, for approximately

PM6-30 3 two months. What was not mentioned was the
 4 light pollution during construction and also
 19:51:37 5 when the plant is up and running. Why should
 6 the families on Puget Island and on the Oregon
 7 side be subjected to this? This project is not
 8 wanted and not needed.

9 Thank you.
 19:51:51 10 MR. FRIEDMAN: Thank you for your
 11 comments.

12 Next is Erie Johnson.

13 MR. ERIE JOHNSON: My name's Erie Johnson.
 14 Last name is Johnson, S-O-N. Thank you for the
 19:52:21 15 opportunity to make a statement. My wife and I
 16 reside in Astoria, and we moved to this
 17 location from the state of Alaska. And one of
 18 the things that we enjoy about this area is
 19 that there are some -- a number of

19:52:39 20 environmental similarities: water, green,
 21 ocean, all those kinds of things that most of
 22 the people that speak here at these events
 23 appreciate.

24 I was pleased to see that you had a
 19:52:56 25 picture of the LNG export plant from Alaska. I 58
 □

Public Meetings

6

PM6-29 The EIS addresses noise in section 4.10.2.

PM6-30 Section 4.7.2.7 includes a discussion of potential visual impacts, including those from lights at the proposed LNG facility.

PM6 RN-110807-FERCpm.txt

PM6-31

19:53:00 1 can tell you that I support this project at
 2 Bradwood, and I also supported that project.
 3 So I'm confident that we have elected
 4 officials, government agencies that will see
 19:53:14 5 that this project's done correctly and will
 6 hold the company to the -- to what the rules of
 7 environmental impact statement and other kinds
 8 of licensing requirements require for a
 9 successful project.
 19:53:32 10 I've been, as I said, in Alaska. I've
 11 worked in several western states with other
 12 kinds of industrial developments, mining and
 13 other things like that, and it's been my
 14 experience, while I'm not a scientist and don't
 19:53:45 15 propose to be one, that -- that these agencies
 16 do hold these companies accountable and, thus,
 17 the projects are -- are not completely without
 18 fault, but for the most part they have been
 19 positive influences on the communities where
 19:54:03 20 they've located.
 21 Some things that I like about the
 22 environment is the water and the wetlands and
 23 those kinds of things, and I was pleased to
 24 hear and see that the company, in its plans,
 19:54:16 25 does have mitigation activities that will
 19:54:19 1 provide for additional wetland and habitat that
 2 might be disturbed with the project.
 3 You asked if people owned property along
 4 the route. I would say that there are a number
 19:54:38 5 of people that live here that would like to own
 Page 49

59

Public Meetings

6

PM6-31 Comment noted.

Public Meetings

6

PM6 RN-110807-FERCpm.txt

PM6-31

cont'd

6 property, but because of the types of
 7 employment opportunities we have, there's not a
 8 lot of young people that are going to be able
 9 to have that opportunity. Projects such as
 10 this one and others that I've seen provide jobs
 11 that will allow people to make family wages and
 12 thus be able to become landowners.

13 Thank you for the opportunity to testify.

14 MR. FRIEDMAN: Thank you for your
 15 comments.

16 Becky -- Becky Read.

17 MS. BECKY READ: Becky Read, R-E-A-D,
 18 (inaudible), Oregon.

PM6-32

19 Three quick comments. Number one, the
 20 relationships are being built with public
 21 safety agencies in the region. I serve the
 22 tricity area, region one, as a work force
 23 development officer, and of course that is my
 24 emphasis. I am pro business, and I know
 25 that -- I mirror some of the comments that the

60

19:55:55 1 previous speaker, Eric Johnson says, that we
 2 really do need this. This is a component of
 3 job growth and economic viability.

4 Number two, we have need for natural gas
 19:56:13 5 as our region grows. And the last -- and
 6 lastly, this is going to have a positive
 7 economic impact on our region that, as we are
 8 becoming business-friendly, more
 9 business-friendly, people are looking at

19:56:31 10 Astoria; that we have an opportunity to make
 Page 50

PM6-32 Comment noted.

Public Meetings

6

PM6 RN-110807-FERCpm.txt

11 something of ourselves with this economic
12 opportunity.

13 Thank you.

14 MR. FRIEDMAN: Thank you for your
19:56:40 15 comments.

16 Richard Parker.

17 MR. RICHARD PARKER: My name's Richard
18 Parker. P-A-R-K-E-R. And I'm here
19 representing myself and my wife. We are
19:56:58 20 residents of Astoria, have been for the last
21 five years.

PM6-33 22 I want to comment just on a couple of
23 items concerning restoration and mitigation
24 being done to accomplish that. NorthernStar

19:57:17 25 has proposed a very robust mitigation plan,

61

19:57:21 1 including restoration programs at Hunt Creek,
2 Svensen Island, and Kalama Creek. They're
3 doing this in order to create or to enhance
4 wetland habitats as compensation for wetlands
19:57:35 5 and habitats impacted by its project.

6 Now, NorthernStar would also implement
7 various mitigation plans to compensate for
8 impacts on water bodies, wetlands, vegetation,
9 and habitats. NorthernStar natural gas will go
19:57:51 10 well beyond, I'm confident of this, what is
11 required for mitigation, and that is why I
12 support Bradwood Landing and this project.

13 MR. FRIEDMAN: Thank you for your
14 comments.

19:58:15 15 Jean Dominey.

Page 51

PM6-33 Comment noted.

PM6 RN-110807-FERCpm.txt

16 MS. JEAN DOMINEY: My name is Jean
 17 Dominey. D-O-M-I-N-E-Y. I live in Astoria. I
 18 have a small letter and an attachment to
 19 submit.
 19:58:42 20 You wanted things directed specifically to
 21 this draft Environmental Impact Statement. I
 22 find in reading it that many of the problems
 23 that are identified, the solutions, however,
 24 are followed very frequently, such as, "there
 19:59:00 25 will be mitigation in part."

62

PM6-34

19:59:07 1 This project is a direct threat to the
 2 restoration of salmon along the entire Columbia
 3 River basin, into British Columbia, Canada.
 4 Our government has spent billions of dollars on
 19:59:20 5 salmon restoration. I was going to specify the
 6 number in here, but I think all of you know it.
 7 The gouging out of the 47 acres we have
 8 heard of -- in here I believe it says 52 of
 9 sediment -- in Clifton Channel will destroy
 19:59:43 10 habitat and organisms in the salmon food chain
 11 as well as the small salmon themselves.

PM6-35

12 I looked for the section on entrainment
 13 and impingement. These will destroy not only
 14 what I mentioned, but in some cases even the
 19:59:59 15 larger fish which can suffocate. I was in
 16 contact today with the National Marine
 17 Fisheries. They tell me that NorthernStar has
 18 yet to specify what type of screening will be
 19 employed. No matter how small this might get
 20:00:19 20 to be, there still be organisms of the food
 Page 52

Public Meetings

6

PM6-34 See our response to comment PM3-68.

PM6-35 See our response to comment FA1-28.

PM6 RN-110807-FERCpm.txt

PM6-35
cont'd

21 chain that will pass through, will be contained
22 in the ships, will be carried out, and then
23 when the water is exchanged in the ocean, as is
24 very common, the freshwater organisms will die.
20:00:39 25 Therefore, the NorthernStar project is a great
□ 63

20:00:44 1 collection point for organisms to eradicate
2 from our environment.

PM6-36

3 Maintaining the turning basin will result
4 in continued silt disturbance, which in here
20:01:00 5 they call silt turbidity, and I must say that
6 the salmon don't limit themselves to 20 feet of
7 water. We will also have, from maintaining the
8 turning basin, increased velocity of channel
9 flow, which in turn results in more shoreline
20:01:21 10 erosion and more destruction of wetlands than
11 has previously been admitted by the applicant.
12 It is not limited just to the section shown
13 here.

PM6-37

14 I mention that the screen has not been
20:01:38 15 addressed, nor has the problem of the waves,
16 stranding of displaced fish. There has been
17 absolutely no study of the amount of displaced
18 fish with wave standing -- stranding by these
19 megalith ships.

20:02:04 20 I would state unequivocally --
21 MR. FRIEDMAN: Wrap up, please.

PM6-38

22 MS. JEAN DOMINEY: -- that this project is
23 in direct violation of goal 16 of the state of
24 Oregon. I am attaching a letter to this letter
20:02:17 25 I'm submitting to you that enumerates some of
Page 53

Public Meetings

6

PM6-36 Section 4.5.2.1 discusses the potential impacts on aquatic resources, including salmonids, due to increased suspended sediment and turbidity levels. Section 4.5.2.1 has been revised to include additional information on the potential impacts on aquatic resources due to sediment transport within the lower Columbia River due to creation and maintenance of the berth and maneuvering area. Specific portions of this comment were not clear, and therefore, could not be addressed.

PM6-37 Screened water intakes are discussed in the response to comment FA1-28. Wake stranding is discussed in the response to comment FA2-19.

PM6-38 See our response to comment IND30-3.

PM6-38
cont'd

20:02:19 1 the salmon species listed on the ferry landing
2 that's two miles upriver from the Bradwood
3 project site. I do not take this threat to the
4 salmon or the thousands of jobs, all the way up
20:02:39 5 to British Columbia that are threatened by this
6 project. Thank you.
7 MR. FRIEDMAN: Thank you for your
8 comments. Put them right here. Thank you.
9 MS. JEAN DOMINEY: Thank you very much.
20:02:53 10 MR. FRIEDMAN: Please correct me if I
11 mispronounce your name. Elizabeth Mannarino.
12 MS. ELIZABETH MANNARINO: Elizabeth
13 Mannarino.
14 MR. FRIEDMAN: Thank you for correcting
20:03:04 15 me.
16 SPEAKER: Elizabeth Mannarino. I'm an
17 Astoria resident.
18 MR. FRIEDMAN: Spell your last name.
19 SPEAKER:
20:03:14 20 MS. ELIZABETH MANNARINO: Oh.
21 M-A-N-N-A-R-I-N-O. I'm an Astoria resident,
22 and I have a number of concerns about this
23 Bradwood Landing project and other LNG projects
24 along the Columbia River that I don't feel have
20:03:36 25 been adequately addressed.

PM6-39

20:03:40 1 One of the issues which has been addressed
2 on the side of problems are dredging and
3 habitat degradation for salmon. I don't think

Public Meetings

6

PM6-39 Because the EIS is a summary document, we believe that the level of detail provided in sections 4.5.2.1 and 4.6.2.2 on the potential impacts due to dredging and habitat modification on salmonids is adequate. However, these topics will be addressed in additional detail in the revised BA and EFH Assessment. See also our response to comment PM3-68.

PM6-40 20:03:57 4 PM6 RN-110807-FERCpm.txt
the solutions have been adequately addressed.

5 I feel that this project is not compatible with
6 the livelihoods of many people in this area.
7 while there will be some jobs by the project,
8 there are many jobs now in fishing and in
9 tourism and recreational boating which would be
10 impacted by the passage of these tankers.

PM6-41 20:04:18 11 The public information on what has to be
12 done for exclusion zones has been quite vague,
13 and for those who know the Columbia River bar,
14 for smaller boats, fishing boats, recreational
20:04:43 15 boats, it's very important to pass at the
16 proper time and tide. If you don't, it's
17 extremely dangerous.
18 Now, if a tanker holds up recreational
19 fishing -- and the recreational fishing season
20:04:59 20 at times are often quite short and the
21 commercial are also quite short -- this could
22 negatively impact the tourism and would also
23 impact the safety and livelihood of the
24 fishermen and women.

PM6-42 20:05:15 25 My other concerns are livelihood of people 66
20:05:20 1 here who depend upon tourism, who depend upon
2 people coming to this area because it is
3 beautiful and attractive and a lovely place to
4 live. The sheer size of the tanks and the
20:05:38 5 project do not at all fit with small and medium
6 sized industrial development. They don't fit
7 with the marine- and aquatic-related industries
8 which are supposed to be fostered.

Public Meetings

6

- PM6-40 We do not believe that the passage of LNG carriers in the waterway to the proposed terminal would have any significant impacts on tourism, fishing, or recreational boating. See sections 4.8.1.7 and 4.8.1.8 in the EIS. As explained in section 4.8, the project would generate jobs, not take them away, and would benefit the regional economy.
- PM6-41 The security zones around LNG carriers in transit to the terminal are discussed in section 4.8.1.7 of this EIS.
- PM6-42 We address the potential impact of the project on tourism in sections 4.8.1.8, 4.8.2.8, and 4.8.3.8. Safety is addressed in section 4.11. The proposed Bradwood Landing LNG import terminal would occupy about 42 acres on land during its operation. This would be smaller than LNG import terminals currently operating at Cove Point, Maryland, Elba Island, Georgia, or Lake Charles, Louisiana, which occupy approximately 100 and 380 acres, respectively.

PM6-43

PM6 RN-110807-FERCpm.txt
The safety is a real concern for me.

20:06:04 10 There are -- there may not have been a large
11 LNG accident; that doesn't mean there won't be
12 one. Chernobyl is something -- we were told
13 nuclear power was safe. Well, sometimes it
14 isn't. Three Mile Island; sometimes it isn't.

20:06:24 15 So it's likely that at some time an accident
16 will happen. We are not prepared for that sort
17 of thing.

18 MR. FRIEDMAN: Elizabeth, wrap it up,
19 please.

20:06:32 20 MS. ELIZABETH MANNARINO: Wrap it up.
21 Okay. The other thing is that the path of
22 ships goes right along the shore in many
23 places, along the Columbia River, between the
24 mouth and Bradwood Landing. There's no way to

20:06:42 25 alter that. I -- I am not entirely familiar

20:06:47 1 with the capacities of shoulder-fired missiles,
2 but I understand that on the black terrorist
3 market they are rather easy to obtain.

4 Now, in order to keep somebody a few

20:07:02 5 hundred feet away from a tanker might be very
6 difficult. Our shoreline is wooded. There are
7 houses along there. What do you have to do?
8 Do you have to move all the people away, or
9 simply not protect them adequately?

20:07:19 10 MR. FRIEDMAN: Elizabeth, let's wrap up.
11 MS. ELIZABETH MANNARINO: Thank you very
12 much.

13 MR. FRIEDMAN: Thank you for your

Page 56

67

Public Meetings

6

PM6-43 Security measures would be required to be put into place to protect the vessel both landside and waterside before approval of the project.

PM6 RN-110807-FERCpm.txt
 comments.

20:07:27 15 Correct me if I mispronounce your name.
 16 We're going to guess it's Cal Dominey.
 17 MR. CARL DOMINEY: It's Carl.
 18 MR. FRIEDMAN: We apologize. We had
 19 trouble reading your writing.

20:08:09 20 MR. CARL DOMINEY: I understand. It's
 21 probably my printing.
 22 Anyway, I have a couple things I want to
 23 enter into the record. The Oregonian --
 24 Oregonian newspaper, interestingly enough, has
 20:08:17 25 a section called Northwest Earthquakes and --
 □

20:08:23 1 MR. FRIEDMAN: Carl, you need to fix the
 2 microphone.
 3 MR. CARL DOMINEY: Is that better?
 4 MR. FRIEDMAN: Yes, it's better.

20:08:27 5 MR. CARL DOMINEY: Okay. The Oregonian
 6 newspaper has a section called Northwest
 7 Earthquakes here, and the other day I just was
 8 glancing at it, and it was kind of interesting.
 9 On November 4th, November 4th, and November 5th
 20:08:40 10 there were earthquakes in Kalama, Washington,
 11 and Maupin, and Forest Grove, Oregon. Those
 12 names should sound pretty familiar to you
 13 people, even if you are from the East Coast.
 14 What it demonstrates, they're not major,
 20:08:51 15 but it demonstrates the instability of the
 16 Pacific Rim. But we do know, and we've been
 17 told a lot of times, that the big one is
 18 coming. Now, these comments are covered in

Page 57

Public Meetings

6

PM6-44 The seismicity of the area and mitigation measures are addressed in section 4.1.3.3.

PM6-45 19 PM6 RN-110807-FERCpm.txt
your DEIS report, Section 5.1.8. NorthernStar

20:09:05 20 proposes 125 to 150 tankers a year. A day

21 upriver and a day back equals 250 to 300 days a

22 year when the river will, practically speaking,

23 be shut down.

PM6-46 24 If the Warren facility is built, these

20:09:22 25 numbers will double. When an LNG tanker is in 69

20:09:24 1 the river, it must be escorted with two

2 vessels, also the same priority designation as

3 search and rescue, which means the Coast Guard

4 vessels cannot leave to go save someone's life.

20:09:36 5 If the Warren facility is built another 150

6 tankers are proposed, which means four Coast

7 Guard vessels would not be available to save

8 lives a majority of the year.

9 Does the Coast Guard have the resources,

20:09:49 10 funding, and manpower to do this? We don't

11 know. The report is classified. And the

12 definition of "classified" is, and I quote,

13 withheld from general circulation for reasons

14 of national security.

20:10:01 15 The public has a right to know what kind

16 of pickle they will be in. The Coast Guard

17 report must be a large part of these

18 deliberations. Without full knowledge of the

19 serious curious consequences of this proposal,

20:10:14 20 common sense would dictate that this

21 application be denied.

PM6-47 22 Now, I'd like to enter this into the

23 record from the water suitability report by the

Page 58

Public Meetings

6

PM6-45 The maximum number of LNG carriers calling at the LNG terminal would be 125 per year. The Columbia River would not be shut down during LNG carrier transits. The cumulative impacts section (4.12) addresses the combined impacts if both the Bradwood Landing Project and the Oregon LNG Project are authorized and built. Protective escorts for LNG carriers would be handled by the Coast Guard. The public version of the Coast Guard's WSR is included as Appendix H of this EIS.

PM6-46 The Coast Guard has not yet obligated any resources to the project.

PM6-47 The WSR requires that a cruise ship in port at Astoria have separate waterside security while an LNG vessel is in transit and that a cruise ship and LNG vessel shall not pass each other in the navigation channel. That does not mean that an LNG vessel cannot pass a cruise ship while in port. With proper scheduling of cruise sailings relative to LNG ship transits, the LNG ship traffic would not impact the cruise ships. As discussed in section 4.8.1.7, the project would have minor impacts on other ship traffic.

PM6-47

cont'd

PM6 RN-110807-FERCpm.txt
 Coast Guard, safety and security zone. Moving
 20:10:26 25 safety and security zone will be established 70
 20:10:28 1 around the LNG vessel, extending 500 yards
 2 around the vessel, but ending at the shoreline.
 3 No vessel may enter the safety and security
 4 zone without first obtaining permission of the
 20:10:39 5 Coast Guard in their report.
 6 Now, comments on the pictures that I'm
 7 about to give to you on these boards. These
 8 pictures --
 9 MR. FRIEDMAN: Thank you.
 20:10:51 10 MR. CARL DOMINEY: These pictures were
 11 taken on Monday and Tuesday of this week in the
 12 middle of Astoria over in the East Warren
 13 Basin. They're mounted so that you'll be able
 14 to follow them along in logical order.
 20:11:03 15 Two comments: Number one, there's a
 16 cruise ship in one these, and that cruise ship
 17 is covered under DEIS report 4.1.8.8: Cruise
 18 ships and LNG tankers are not to be near each
 19 other. I'm paraphrasing that a little bit.
 20:11:19 20 Two, Columbia River Channel Organization
 21 estimates 40,000 jobs are in some way connected
 22 to shipping on the Columbia River. You think
 23 about that. Directly or indirectly. LNG
 24 tankers will have a dramatic adverse effect on
 20:11:32 25 the shipping, i.e., jobs. In these pictures 71
 20:11:38 1 you will see on Monday that there are nine
 2 tankers. Most of them are moored in the river.
 Page 59

Public Meetings

Public Meetings

6

PM6-47
cont'd

PM6 RN-110807-FERCpm.txt

3 One or two are moving up and down the river.
4 In the set of pictures taken on Tuesday, you
20:11:51 5 will see that there are ten tankers and one
6 cruise ship.
7 MR. FRIEDMAN: Carl, wrap up, please.
8 MR. CARL DOMINEY: Ten more seconds.
9 Okay. There are ten tankers and one
20:12:01 10 cruise ship. The channel of the cruise ship is
11 just a few hundred feet from the side of cruise
12 ship. Now, what is the point of these
13 pictures? The congestion obviously. The point
14 of the pictures is you cannot have both. The
20:12:17 15 commerce shipping and the cruise shipping won't
16 be able to operate effectively, and that's
17 where the adverse effect comes on the jobs.
18 Okay. So a choice really needs to be
19 made. If you're going to have LNG, you're
20:12:29 20 going to have to expect a massive adverse
21 effect on jobs and shipping and cruises in
22 Astoria. If you're going to have those, then
23 you can't have LNG. Thank you for allowing me
24 to finish.
20:12:40 25 MR. FRIEDMAN: Thank you for your
□

20:12:41 1 comments.
2 Next is Roger Rocka.
3 MR. ROGER ROCKA: Hi. It's Roger Rocka,
4 R-O-C-K-A. I live in Astoria, Oregon. From
20:13:01 5 '94 to '04, I was the executive director of the
6 Astoria and Warren Chamber of Commerce.
7 Nothing really makes sense without
Page 60

PM6 RN-110807-FERCpm.txt

PM6-48

8 context, and since the promoters who are
 9 pushing this project and the people who
 20:13:15 10 ultimately will have authority over it are
 11 strangers here, I'd like to offer a little bit
 12 of local context, if I may.

13 The Columbia River is not a suitable site
 14 for an LNG terminal. This is famously the
 20:13:29 15 graveyard of the Pacific, the place where more
 16 than 2,000 ships and boats have perished. Even
 17 today the Columbia is -- the Columbia bar is
 18 impassible for days at a time because of fierce
 19 winter storms.

20:13:43 20 The shipping channel is narrow, with
 21 little room to maneuver, and it hugs the Oregon
 22 shore. As it passes Astoria, the shipping
 23 channel brings LNG tankers very close, within a
 24 stone's throw, of large numbers of people.

20:13:58 25 Whether you're in a metropolitan area of 10

73

20:14:02 1 million or a town of 10,000, I think the point
 2 is to not bring LNG in close contact with
 3 thousands of people. And that will happen
 4 here.

PM6-49

20:14:11 5 we are a long way from where the gas will
 6 be used, meaning long pipelines through
 7 presently unspoiled lands. This is the one and
 8 the only great river of the West, the one and
 9 the only Columbia estuary, where we do all we
 20:14:27 10 can to preserve precious wildlife habitat
 11 that's vanishing elsewhere.

12 This project has no harmony with this
 Page 61

Public Meetings

6

PM6-48 The Coast Guard has determined in its WSR that the Columbia River navigation channel would be suitable for LNG marine traffic if measures were implemented to responsibly manage navigation, safety, and security risks. These measures are discussed in detail in section 4.11.5.4.

PM6-49 See our response to comment PM1-23.

PM6 RN-110807-FERCpm.txt

PM6-50

13 place. It does not complement what exists
 14 here. It does not benefit the people or the
 20:14:39 15 nature that exists here. The project does not
 16 conformed to county or state zoning and
 17 planning policy, unless you somehow suspend
 18 common sense and define this development that
 19 is bigger than anything else in this region as
 20:14:55 20 small.

21 Only a few LNG terminals will be built,
 22 and there may be other places in the country
 23 that have the infrastructure, that have the
 24 separation from population, and that want the
 20:15:07 25 development. This is not one of those places.

74

20:15:12 1 Also I've heard mention made of jobs this
 2 evening, and from what I've seen, there are a
 3 lot of jobs in this project already. There's a
 4 lot of high-priced talent being employed by the
 20:15:24 5 promoters of this project. But those of us who
 6 live here really aren't willing to sell our
 7 river for 35 to 50 jobs, and we think that's
 8 what's happening. Thank you.

9 MR. FRIEDMAN: Thank you for your
 20:15:40 10 comments.

11 (Applause.)

12 MR. FRIEDMAN: Jan Mitchell.

13 MS. JAN MITCHELL: He's a tough act to
 14 follow, but I'm his wife. I'm used to it.

20:16:01 15 I'm a planner, or a retired planner, and
 16 my understanding of the EIS is that it is the
 17 document that follows a project but is the
 Page 62

Public Meetings

6

PM6-50 Project impacts on existing land-use are addressed in section 4.7. The Clatsop County Board of Commissioners approved NorthernStar's comprehensive application for permits and land use approvals, including proposed zoning changes, in March 2008. The LNG terminal and pipeline are now accepted uses in Clatsop County, consistent with local zoning and planning guidelines.

PM6-51

PM6 RN-110807-FERCpm.txt

18 thing that gives an unbiased evaluation of what

19 the impacts that we can understand will be.

20:16:22 20 And so it's a very important document, and it's

21 very important that it not be subjective, that

22 it not be influenced by who is running the

23 project and/or pressured. And there are just a

24 few things in this study that I think are very

20:16:46 25 crucial. Roger's mentioned some -- most of

□

20:16:49 1 them.

2 This -- this -- this LNG project would

3 cause an amount of six ships a day to go past

4 Astoria. It would go past sensitive uses, go

20:17:03 5 past an elementary school, a hospital, lots of

6 senior housing and, as mentioned before, it

7 passes our newest national park and lots of

8 historic sites of national significance.

9 We've also talked about salmon here, and

20:17:27 10 unless somebody mistakes salmon for animals

11 that have been joked about in the past major

12 EISs, like butterflies and prairie dogs and so

13 on, the salmon is an indicator for how well

14 we're doing here. The salmon and the people

20:17:44 15 are inextricably linked, and the salmon is sort

16 of our canary in the coal mine, and it's not

17 doing well.

18 And we've built lots of people -- because

19 we are a small community, we have lots of

20:17:58 20 wonderful people sitting out in this audience

21 who you might find cleaning up a river channel,

22 dragging trees to shade a stream, people who

Page 63

75

Public Meetings

6

PM6-51 The FERC has taken into consideration weather, seismicity, and the navigational hazards of the Columbia River Bar as part of the EIS.

PM6-51
cont'd

PM6 RN-110807-FERCpm.txt

23 give up their weekends to go and try to make
24 conditions better for the salmon.

20:18:17 25 The immensity of this project argues 76
□

20:18:21 1 against all of those efforts that are under
2 way. I was a planner in California, so I know
3 about seismic safety. I can't even imagine
4 what a level-nine earthquake is. I've seen 7.3

20:18:39 5 or something. I can't even imagine, but it's
6 going to change our world. You know, my house
7 may be down on the next block below me if I'm
8 lucky, but I -- and that we know is going to
9 happen. It happens every three to five hundred

20:18:56 10 years.
11 We have evidence on the ground, you can go
12 to the coastline here, you can go to the Ecola
13 State Park and see the evidence of those
14 earthquakes. You can see the swales and the

20:19:10 15 dunes in Clatsop Plank, and that shows you
16 where those earthquakes have occurred.

17 Now, if you have that kind of
18 destruction -- and we're going to be shut off,
19 say, for a week or two, because Portland's

20:19:25 20 going to be in trouble. They're not coming to
21 us. And then you have a huge facility like
22 this of a flammable material -- I mean, just --
23 it just -- it makes me unable to describe what
24 that -- what that may be happening.

20:19:44 25 MR. FRIEDMAN: Can you wrap up? 77
□

Public Meetings

Public Meetings

6

PM6-51 20:19:45 1 PM6 RN-110807-FERCpm.txt
 MS. JAN MITCHELL: Yes, I will.

cont'd 2 Anyway, I would like you to go back, look
 3 at this impact statement, and look at the
 4 impacts of weather on the coast, the difficulty
 20:19:54 5 of crossing the Columbia bar, and the
 6 likelihood of a catastrophic earthquake, and
 7 see if that doesn't figure more into how you
 8 approach this.

9 MR. FRIEDMAN: Thank you for your
 20:20:07 10 comments.

11 Next on the list is Dale Treusdell.

PM6-52 12 MR. DALE TREUSDELL: Dale Treusdell.
 13 T-R-E-U-S-D-E-L-L. I'm a frequent visitor to
 14 the area and have family living in this area.

20:20:43 15 I've become interested to some degree what's
 16 going on. One of the things that came up in
 17 discussion was the amount of traffic that was
 18 going to be on the -- created because of this
 19 project, if it goes forward. And I got to
 20:21:00 20 thinking about that, and I have a little
 21 information, that this would be approximately
 22 125 ships a year. I think some were saying six
 23 a day, something of that kind. And it's true
 24 that it's an increase, 6 to 8 percent possibly.

20:21:22 25 But there's a price that everybody pays
 78

20:21:24 1 for progress, and I think one of the things
 2 that we have been running into this evening is
 3 that many people are not interested in paying
 4 the price, but if you're going to have
 20:21:40 5 progress, you're going to move ahead, you're

PM6-52 Comment noted.

Public Meetings

6

PM6-52

cont'd

PM6 RN-110807-FERCpm.txt
 going to do something in the area -- there's a
 lot more than just the few jobs that are
 concerned with the plant itself when they talk
 about how many jobs are involved, because we're
 talking about running up and down the full
 coast.
 If you've been looking at your gasoline
 prices lately, you can understand where energy
 enters into this. We need energy. We need a
 project of this kind to help -- to help in that
 aspect. In the interest of brevity, I'll let
 it ride at that.
 MR. FRIEDMAN: Thank you very much for
 your comments.
 Next is Jeanette -- please correct me when
 I mispronounce your name -- Nachbar.
 MS. JEANETTE NACHBAR: That was very good.
 It's very close. It's pronounced knock-bar.
 It's spelled N-A-C-H-B-A-R.

PM6-53

20:22:48 25 I want to state that I think Bradwood
 20:22:51 1 Landing -- I'm a proponent of this project, and
 2 I think that Bradwood Landing will continue to
 3 meet and exceed the standards that have been
 4 set forth by the state and federal and county
 20:23:00 5 agencies. I feel it is an important project.
 6 I feel that we need the tax revenue that this
 7 is going to bring to Clatsop County. We're an
 8 extremely poor county, and we need to do
 9 everything we can to open our doors to
 20:23:14 10 industry.

79

PM6-53 Comment noted.

PM6-54

11 PM6 RN-110807-FERCpm.txt
 I think LNG and gas is a good bridge
 12 energy to be used until we can come up with
 13 better things in the future and make a more
 14 massive change throughout the United States.

PM6-55

20:23:28 15 I have heard a lot about fear tonight,
 16 fear of explosions, that type of thing. I live
 17 with someone who's in the disaster-planning
 18 area, works in that area. I actually have to
 19 do that for Washington County for the section
 20:23:41 20 that I work in, and I'm probably very well
 21 prepared for a disaster at my house.

22 I know about tsunamis and destruction
 23 zone, but I don't worry about the day-to-day
 24 fears that I'm hearing here today. And I think
 20:23:58 25 with liquified natural gas plants, the safety

80

20:24:01 1 record they've had in the past speaks for
 2 itself. I also find that it's rather arrogant
 3 and ironic to talk about salmon restoration and
 4 hunting and fishing the animals at the same
 20:24:15 5 time, in the same evening. I've gotten a real
 6 kick out of that, but that's just a private
 7 thing.

8 Thank you.
 9 MR. FRIEDMAN: Thank you. Frank -- again,
 20:24:28 10 correct me when I pronounce your name --
 11 Aquesto.

12 MR. FRANK AQUESTO: Frank Aquesto.
 13 A-Q-U-E-S-T-O. I've lived in the county here
 14 for 20 years, come from Portland. The first
 20:24:48 15 thing I want to address is the safety feature

Page 67

Public Meetings

6

PM6-54 Comment noted.

PM6-55 LNG safety is discussed in section 4.11.

PM6-56

16 PM6 RN-110807-FERCpm.txt
 of these tanks. They seem to be everybody's
 17 concern. If anybody's familiar with the east
 18 end of the Ross Island Bridge, years ago there
 19 used to be huge storage gas tanks. At that
 20:25:01 20 time, if anybody remembers, they were
 21 manufacturing gas and coal and storing it
 22 there. Anyway, I never heard of one incident
 23 there in all these years. I'm sure in all
 24 these years the technology has improved
 20:25:13 25 immensely.

81

PM6-57

20:25:14 1 As far as the fish and water intake by LNG
 2 ships at berth would be screened to prevent
 3 entrenchment and impingement of salmon and
 4 steelhead both. This is supposed to set a high
 20:25:27 5 standard on the Columbia. Thank you.
 6 MR. FRIEDMAN: Thank you.
 7 Carol Newman.
 8 Are you being attacked by the microphone?
 9 MS. CAROL NEWMAN: Carol Newman, as in
 20:25:48 10 Paul. Brownsmead resident of 33 years.
 11 And I just -- I can't help but -- there's
 12 the switch. Okay. Talk about arrogance,
 13 arrogance, arrogance of people who care about
 14 salmon restoration and yet hunt and fish. I
 20:26:19 15 was quite interested to hear Jeanette to say
 16 that because I'm a vegetarian. I'm sure she
 17 is, too, because she will not hunt and fish.
 18 Totally blew me away, because the salmon
 19 restoration and fishing go together.
 20:26:33 20 But anyway, the person that I really --

Page 68

Public Meetings

6

PM6 RN-110807-FERCpm.txt
 21 all right. I'm just going to handhold this
 22 thing. It's too high for me.
 23 The person that really disturbed me is
 24 gone now, but I just want this on the record.
 20:26:57 25 I couldn't get his name quite right, James
 □

82

20:27:00 1 Kodama from Longview, who dared --
 2 UNIDENTIFIED SPEAKER: Kelso.
 3 SPEAKER:
 4 MS. CAROL NEWMAN: Kelso. I'm sorry. The
 20:27:07 5 Longview don't want to hear he's from Longview.
 6 I found his behavior odious, and I also
 7 quote, was that Jerry Havens is a hired gun.
 8 That's what he said. I hope somebody will
 9 investigate and find out who he is and who
 20:27:27 10 wrote that piece that he said. Dr. Havens is
 11 the scientist who prepared all the material
 12 that is used throughout the world. Who the
 13 hell is this guy, talking science as if he
 14 knows what he's talking about?

PM6-58

20:27:42 15 Okay. So, back to what I wanted to say
 16 before these guys talked. Just a couple of
 17 items. I live within three miles of Bradwood
 18 Landing. I do not consider myself someone who
 19 needs to be talking about terrorists or
 20:28:08 20 anything else, but I also don't consider myself
 21 a person who should be thought of, or any of
 22 the other people in this room, for or against,
 23 as dispensable.

24 Whether we are tens, hundreds, or
 20:28:23 25 thousands, or millions, Boston or Long Beach,
 □

83

PM6-58 Safety, security, and reliability are discussed in section 4.11 of the EIS.

PM6 RN-110807-FERCpm.txt

PM6-58
cont'd

20:28:27 1 California, the fact is if a tanker blows in
2 front of Astoria, or a pipeline blows, or
3 anything happens to those ships in the Columbia
4 River, we will be impacted. And when I say
20:28:41 5 "we," I don't mean the folks from Texas or you
6 folks; I mean us, those of us who choose to
7 live here because we care for this place. We
8 take care of this place.
9 The major earthquake is expected,
20:28:56 10 according to science, within the next 50 years.
11 Maybe it won't happen. But it is expected.
12 Mitigation? God, we've lived with that word
13 for 30 years, mitigation, and it was Brown &
14 Root, the Halliburton folks, who used it here
20:29:15 15 30 years ago.

PM6-59

16 MR. FRIEDMAN: Carol?
17 MS. CAROL NEWMAN: Okay. I want to say
18 Svensen Island was ours and it still is. It's
19 going to be taken care of without NorthernStar,
20:29:24 20 and I hope FERC will take care of that for us,
21 make sure to use the DEIS, the EIS to protect
22 this area. Thanks.
23 MR. FRIEDMAN: Thank you for your
24 comments.
20:29:35 25 MS. CAROL NEWMAN: I'll put this back
□

84

20:29:37 1 carefully so the next person can use it.
2 MR. FRIEDMAN: Here's my quandary, is that
3 when you signed in, some people checked the box
4 they had spoken before, but I do not recognize
Page 70

Public Meetings

6

PM6-59 See our response to comment FA3-3.

Public Meetings

6

PM6 RN-110807-FERCpm.txt

20:29:46 5 them. So I'd like them to stand up and tell me
6 whether you've spoken at any of the five
7 previous FERC meetings this week. So please
8 stand up and let's clarify this.

9 David Ambrose.

20:29:57 10 MR. DAVID AMBROSE: I have not spoken this
11 week.

12 MR. FRIEDMAN: Thank you for clarifying.
13 Jimmy Beckwith.

14 MR. JIMMY BECKWITH: I have not spoken.

20:30:04 15 It was two years ago when I spoke. So I said,
16 yeah, I spoke.

17 MR. FRIEDMAN: I meant this week. I'll
18 explain why in a second. Jay Kiddle?

19 MR. JAY KIDDLE: No, I haven't.

20:30:14 20 MR. FRIEDMAN: All right. And John
21 Koehler.

22 MR. JOHN KOEHLER: I spoke last night.

23 MR. FRIEDMAN: You did speak. So except
24 for John, I'm going to call the people's whose

20:30:24 25 names I said first, and then we'll have gone

85

20:30:26 1 through everybody, and I'm going to again --
2 the way we run these meetings is I let people
3 who have not spoken go first, and then if we
4 have time -- because we're going to close this
20:30:37 5 meeting at 10:00 -- if we have time, then
6 people who did speak at previous meetings will
7 get another opportunity if we have time.

8 So now I'm going to go through that list
9 again. And David Ambrose, you're first.

Page 71

PM6 RN-110807-FERCpm.txt

PM6-60

20:30:52 10 MR. DAVID AMBROSE: David Ambrose,
 11 A-M-B-R-O-S-E. I live in Astoria.
 12 The first thing is invasive species and
 13 noxious weeds, in another capacity. My agency
 14 is the point agency for noxious weed control in
 20:31:10 15 the county, and I've read very briefly the
 16 section on what the proponents plan to do to be
 17 sure that we don't get any new ones and to be
 18 sure that they don't spread any of the old ones
 19 that we have.
 20:31:28 20 I hope that they keep in good contact with
 21 the Oregon Weed Board and keep up to date on
 22 what's going on. I wanted to list just four
 23 new ones, ones that are of concern to us in
 24 Clatsop County:
 20:31:41 25 Gorse, of which we have only one colony,
 □
 20:31:43 1 and we spend approximately \$1500 a year to
 2 control;
 3 One called clematis vitalba,
 4 V-I-T-A-L-B-A, and that -- we have a small
 20:31:57 5 colony of that, but in the Portland area it's
 6 rapidly taking over a lot of our forests. We
 7 don't want to see that one come here;
 8 Garlic mustard, which has just started its
 9 invasion in the county -- not in the county,
 20:32:11 10 but in the state;
 11 And another big one is Spartina grass,
 12 which, as you may know, in Willapa Bay is a
 13 problem that they're dumping millions of
 14 dollars in to try to eradicate. Their plan
 Page 72

86

Public Meetings

6

PM6-60 To prevent the introduction or spread of noxious weeds (including Gorse (*Ulex europaea*), evergreen clematis (*Clematis vitalba*), garlic mustard (*Alliaria petiolata*), and Spartina grass (*Spartina spp.*)), we have recommended in section 4.4.2.3 that NorthernStar continue to consult with the COE, FWS, NMFS, Oregon and Washington Departments of Agriculture, and other appropriate resource agencies to revise its Noxious Weeds and Soil-borne Plant Disease Control Plan.

NorthernStar included its Noxious Weeds and Soil-borne Plant Disease Control Plan as part of its JPA. NorthernStar filed its JPA with the FERC on November 22, 2006, and filed revisions to the JPA on April 5, 2007. This document is available for viewing by the public on the FERC's Internet web page at www.ferc.gov, through the eLibrary link.

PM6-60
cont'd

PM6 RN-110807-FERCpm.txt

20:32:26 15 looks fairly well, but I hope that you'll hold
16 them to a higher standard and make sure that
17 they're completely vigilant with all of the
18 crews and construction crews that would be
19 working on a pipeline.

20:32:38 20 The chances that we get invasive new
21 species, it's pretty high, and once they're
22 here, they're very hard to get rid of. We have
23 a couple that we've been trying to work on for
24 five years in small patches. They're still
20:32:51 25 there, with the arsenal river sites that we can
□ 87

20:32:56 1 use.
2 The other thing I wanted to point out on
3 the point of order was you've asked us not to
4 make personal attacks on people, and at least
20:33:05 5 two of the people that I've heard tonight have
6 done that. I hope that you will be a little
7 more forceful in keeping people to the line
8 because we all get emotional, and those
9 emotions can rise to the -- to the meeting.

PM6-61

20:33:22 10 One other thing now. The 500-meter
11 exclusion zone as it goes past Astoria, the
12 assumption may have been that the center line
13 of the channel was used to make that 500-meter
14 exclusion zone, but I hope that you can
20:33:37 15 research and check a little closer to make sure
16 that the vessels that use that channel may not
17 be in the center line of the channel a lot of
18 the time. Maybe they're to the landward side,
19 maybe to the water side. And that 500-meter
Page 73

Public Meetings

6

PM6-61 By definition, the Zones of Concern would be centered on the LNG vessel. For purposes of the EIS, we assumed the Zones of Concern were centered in the middle of the navigation channel. Depending on the LNG vessel position, they could be shifted somewhat from the middle of the channel, but they would not be wider. Our identification of features that would fall within the respective zones would not be affected by the uncertainty in vessel position at the scale considered.

PM6-61 | PM6 RN-110807-FERCpm.txt
 cont'd | 20:33:53 20 zone may be a little bit wider than it's
 21 indicated in the maps.
 22 Thank you.
 23 MR. FRIEDMAN: Thank you for your
 24 comments.
 20:34:06 25 Jim Beckwith. 88
 □
 20:34:08 1 MR. JIMMY BECKWITH: Yes. Hello. My name
 2 is Jimmy Beckwith. I have one question for
 3 you --
 4 MR. FRIEDMAN: Mr. Beckwith, spell your
 20:34:12 5 last name for the court reporter.
 6 MR. JIMMY BECKWITH: Oh. B-E-C-K-W-I-T-H.
 7 Beckwith.
 PM6-62 | 8 And I do have one question I wanted to ask
 9 you guys, but most of it is for these people
 20:34:23 10 back here. Seems like everybody is coming up
 11 and talking about emotional issues and concerns
 12 about the environment and stuff like that, and
 13 we're all concerned about that. I'm a 60-year
 14 resident of this community. I was born in
 20:34:36 15 Astoria. I am a construction worker. I have
 16 been around a lot of projects, got turned down
 17 because they were nasty, polluting things.
 18 The aluminum plant, it got turned down.
 19 They wanted to put a train once a week through
 20:34:55 20 Astoria full of coal and dump it in Warrenton
 21 and said it was really good for us. It wasn't.
 22 It got turned down.
 23 Now, LNG, natural liquefied gas, barely
 24 burns. It doesn't explode. It's not
 Page 74

Public Meetings

6

PM6-62 LNG safety is discussed in section 4.11.

Public Meetings

6

PM6 RN-110807-FERCpm.txt

PM6-62
cont'd

20:35:11 25 dangerous. It floats on the water. It won't 89
 20:35:13 1 get into the ground. When it does turn into a
 2 vapor, it doesn't go along the ground like
 3 propane; it rises and goes away. It catches
 4 fire, it burns straight up like a candle. It
 20:35:25 5 doesn't go whoosh. I'm telling you, people,
 6 don't let fears from people that are just
 7 afraid of everything, you know, dissuade you on
 8 this. It's just amazing. This is the
 9 cleanest, safest procurement project there is
 20:35:43 10 around.
 11 Our community, I've been -- I've been on
 12 boards for fire departments. I work for the
 13 community. I am invested in this community.
 14 It's my whole life. I'm not going to allow
 20:35:55 15 anything to come in here. I've been working at
 16 this, being at most of the meetings for -- just
 17 holler when I'm done -- for the whole time, and
 18 I'm looking to be sure that it's going to be
 19 safe in some way. If it's not safe, I want to
 20:36:09 20 know about it. I'm going to argue about it.

PM6-63

21 But I'm telling you, this community is
 22 losing timber revenues. The fire departments
 23 are raising taxes and whatnot. Our
 24 communities, everyone from Westport to Cannon
 20:36:22 25 Beach, is going to benefit from the tax 90
 20:36:26 1 revenues that come in. We must have industry.
 2 We can't survive with just tourists and things

PM6-63 Comment noted.

PM6-63

cont'd

PM6 RN-110807-FERCpm.txt
 3 like that.
 4 Our schools are getting less and less
 20:36:38 5 things that they can do because they cut
 6 programs and they cut programs and they cut
 7 programs. Man, when I was a kid, I went to
 8 this school when they first built it. Of
 9 course, they've done a lot of remodeling. I
 20:36:49 10 wish they could remodel me.

PM6-64

11 But my question for you guys is, and this
 12 is of concern, one of the very first speakers
 13 that came on here said that the technologies
 14 that they're using or proposing for these ships
 20:37:01 15 and the plant are not up to snuff, that they
 16 are outdated. Is this true? You're not going
 17 to answer me, of course.
 18 MR. FRIEDMAN: Right. That's a rhetorical
 19 question. We'll answer it in the FEIS.
 20:37:12 20 MR. JIMMY BECKWITH: But it's important
 21 that you folks guard against it, if it is that
 22 sort of thing, and somehow or other let people
 23 know that it's not technology that is viable.
 24 I believe the technology is there --
 20:37:23 25 MR. FRIEDMAN: Mr. Beckwith, you told me
 □

91

20:37:25 1 to cut you off when you were done.
 2 MR. JIMMY BECKWITH: Why, thank you. I
 3 believe the technology is safe and is proven.
 4 MR. FRIEDMAN: The answer is that we
 20:37:34 5 employ a suite of engineers who do an extensive
 6 job of looking at the engineering drawings and
 7 the engineering plans, and they would recognize

Public Meetings

6

PM6-64 The technical design of the Bradwood Landing Project is safe and sound as discussed in section 4.11.

Public Meetings

6

PM6 RN-110807-FERCpm.txt
 8 whether or not this is the most up-to-date LNG
 9 engineering. We look at these kinds of
 20:37:49 10 projects all across the nation all the time and
 11 consider our staff of engineers to be LNG
 12 experts.

13 Next on my list is Mr. Faust. Mr. Faust,
 14 please tell us your first name.

20:38:14 15 MR. FRED FAUST: This newspaper article --

16 MR. FRIEDMAN: Mr. Faust, what's your
 17 first name? Your first name?

18 MR. FRED FAUST: Fred.

19 MR. FRIEDMAN: And spell your last name
 20:38:23 20 for the court reporter.

21 MR. FRED FAUST: It's one of my names,
 22 Faust, F-A-U-S-T.

23 MR. FRIEDMAN: Thank you.

24 MR. FRED FAUST: And the newspaper article
 20:38:31 25 had something about an engineer that lived back
 □

92

20:38:34 1 in 1912 in England, and he was noticing an
 2 advertisement from the folks that put out the
 3 S.S. Titanic and where they were mentioning
 4 that their luxury liner was 110 percent safe.

20:38:49 5 And as a professional engineer, he commented,
 6 he said, I can't understand how anything can be
 7 110 percent safe. He said, I'm going to book
 8 passage on the maiden voyage because I want to
 9 get to the bottom of this thing.

20:39:05 10 (Laughter.)

11 MR. FRED FAUST: That was a little
 12 something I just jotted down today.

PM6-65

PM6 RN-110807-FERCpm.txt
 As a World War II veteran, I just wanted
 to say thanks for the air power from the 50
 carriers launched here in the Columbia. As a
 safeguard for national security and more
 dependable air currents, would it be okay to
 locate the LNG operations within three miles of
 our coast, our coastline? And I want to thank
 the LNG folks for considering this beautiful
 state. Thank you.
 (Laughter.)
 MR. FRIEDMAN: Thank you for your comment.
 Jay Kiddle.
 MR. JAY KIDDLE: My name is Jay Kiddle.

93

PM6-66

K-I-D-D-L-E. And first off, before I get into
 my comments, I do want to comment on this guy's
 statement about natural gas not being
 explosive. I lived through a natural gas
 explosion when I was 21, in the Portland area.
 It devastated a square-block building that I
 was in. I was the only one in that building
 that walked out unhurt, thank God, and I took
 people out. There were balls of flames, and I
 will never be around this facility, facility in
 our community, and a lot of people will be
 moving out too.

PM6-67

But my comment is I'm a boater, pleasure
 boater, and I spend most of my pleasure time
 out on the Columbia River, and I'm greatly
 concerned about the closure of our river to
 other uses and boaters.

Page 78

Public Meetings

6

PM6-65 Offshore alternatives are assessed in section 3.1.4.1.

PM6-66 Natural gas vapors (primarily methane) can explode if contained within a confined space, such as a building or structure, and ignited.

PM6-67 As discussed in section 4.8.1.8, the lower Columbia River and the Columbia River bar would not be closed to recreational boaters during LNG carrier transits in the waterway to the proposed Bradwood Landing LNG terminal.

PM6-67

cont'd

PM6 RN-110807-FERCpm.txt
Against international treaties in the
history, historical use of the seas, while this
20:40:54 river is wide, it is not deep. There is no
room to get out of the channel for sailboaters
and other pleasure crafts that travel the
river. Most travel at four to six knots. Most
have radios, but very rarely do we ever have
20:41:11 them on. Now, I don't know how we're going to
□ 94

20:41:13 extrude us out of the river when we're out
there tooling around.
There is -- I'm especially worried about
bar closures for boaters. There's limited time
20:41:24 for pleasure boaters to cross the bar. If you
ever come down from Washington, come down the
beautiful Juan de Fuca Straits, and you plan 36
to 40 hours to get down here to the Columbia
River. What do you do if you get down here and
20:41:39 the river's closed, the bar's closed to other
uses?
You can only cross that bar at the bottom
of the river tide and the top of the tide for
pleasure boaters. If you're excluded from
20:41:51 those times, you have to wait 12 hours or six
hours before you can cross that river. Who in
their right mind is going to head for our
Columbia River if they're going to be excluded
from getting into here?

PM6-68

20:42:04 I'm worried about storm closures of the
bar. When they open these rivers back up, the
bar back up, who's going to get the

Page 79

Public Meetings

6

PM6-68 Decisions regarding vessel movements and priority after storm events
would be made by the pilots.

PM6-68 23 PM6 RN-110807-FERCpm.txt
 cont'd 24 right-of-way? Well, our fishermen have to sit
 20:42:17 25 out there and lose their catches while they
 □ wait for this river (sic) to turn around?

95

PM6-69 20:42:21 1 And everyone's talking about terrorists.
 2 Well, it doesn't take a terrorist to cause
 3 harm. In the 20 years I've lived here in
 4 Astoria, lifelong Oregonian here, in the 20
 20:42:32 5 years I've been here, we've had dozens of
 6 freighters, commercial freighters, run aground
 7 by river and bar pilots in our river. In the
 8 early '90s we had a freighter ripped off the
 9 Port of Astoria, pier three, and ended up
 20:42:48 10 against the Megler Astoria bridge, which closed
 11 the bridge for over a day. That ship was
 12 docked by union longshoremen. We don't need
 13 terrorists. All it takes is an accident.

PM6-70 14 We share this river with all kinds of
 20:43:03 15 hazardous materials and ships that carry all
 16 kinds of materials up and down this river. If
 17 this LNG isn't -- if this LNG is so safe, why
 18 are they closing the river to other uses? Our
 19 Columbia is a national treasure. We do not

PM6-71 20:43:21 20 need this plant on it. It will be detrimental
 21 to our wildlife and Lewis and Clark National
 22 Wildlife Reserve.
 23 I thank you and ask you to deny Bradwood
 24 Landing's application.

20:43:36 25 MR. FRIEDMAN: Thank you for your
 □

96

20:43:37 1 comments.

Page 80

Public Meetings

6

PM6-69 See our response to comment PM6-48.

PM6-70 The Columbia River would not be closed to other users. The safety/security zone would establish the Coast Guard's authority in the area surrounding the LNG vessel to ensure safety during the transit.

PM6-71 Impacts of the project on wildlife and the LCNWR are discussed in sections 4.5 and 4.6.

PM6 RN-110807-FERCpm.txt

2 I believe that I've called everyone on the
 3 list who had not previously spoken. So now I'm
 4 going to ask the audience, is there anyone who
 20:43:46 5 would like to speak who did not speak at the
 6 previous FERC meeting this week? If so, raise
 7 your hand.

8 Yes. Okay. Please come up here, then,
 9 state your name for the record, spell your name
 20:43:59 10 for the court reporter.

11 MR. ROBERT HALSAN: My name is Robert

12 Halsan. I can --

13 (Reporter requests clarification.)

14 MR. ROBERT HALSAN: It's spelled
 20:44:10 15 H-A-L-S-A-N.

16 I can outdo most of these people. I've
 17 been here for 75 years, and if that's any
 18 attribute, then I think I'm in a position to
 19 assess some of the things and make comments on
 20:44:26 20 some of the things that have surfaced this
 21 evening.

22 Safetywise, I personally am married to a
 23 lady whose father fished on the river for some
 24 48 years, and that's one thing that is

PM6-72 20:44:43 25 certainly a concern. Likewise, let's address

97

20:44:46 1 the safety features. More especially, if you
 2 have reason to be on the river or frequent the
 3 shoreline, you'll note that there's a lot of
 4 river traffic, namely, container ships.

20:45:01 5 I personally harbor more concern of the
 6 safety features of these container ships that
 Page 81

Public Meetings

6

PM6-72 Safety is discussed in section 4.11 of the EIS.

PM6 RN-110807-FERCpm.txt

PM6-73

7 are frequenting this river. Namely, there are
 8 five concerns, especially based, I suspect, in
 9 Japan, that frequent the scene, frequent the
 20:45:21 10 port for the most part. And on board those
 11 same ships, who knows what in the world's in
 12 the holds or in the containers. It's not
 13 even -- Homeland Security doesn't have reason
 14 to even have any inkling of what, in fact,
 20:45:38 15 might be on board.

16 Good Lord. Lord knows all it takes some
 17 dirty bomb that would be dropped off the ship
 18 in transit to Port of Portland and what, pray
 19 tell, would happen to our whole river system?

20:45:52 20 This is -- this is a safety concern I'm
 21 really concerned about. I think I'm totally
 22 justified in saying that. I have more than
 23 just a direct bearing on it. I observe these
 24 same ships. There are, like I said, five
 20:46:09 25 different concerns, of Japanese-based concerns.

98

20:46:12 1 The river pilots I understand service three and
 2 a half of those same ships a week, and they
 3 spend, what is it, about -- I believe it's
 4 about two and a half hours to take that ship
 20:46:32 5 upriver to a point where it would be at its
 6 resting place at the Bradwood Landing site.

PM6-74

7 One other concern that I heard mentioned
 8 is landslides. Well, granted, there was a
 9 landslide to the immediate east of that locale
 20:46:47 10 that came down, and I don't know -- it did take
 11 the life of a person off of Puget Island. But
 Page 82

Public Meetings

12 as far as landslides up there in that Bradwood
13 area, I would certainly stand corrected, but I
14 know of no instances where there have been any
20:47:05 15 landslides per se. I don't feel that's a real
16 critical issue.
17 The other item that I note that is really
18 a concern to a lot of people and people who are
19 more than casual acquaintances of mine --
20:47:23 20 MR. FRIEDMAN: Sir, wrap it up.
21 MR. ROBERT HALSAN: Am I out of time?
22 MR. FRIEDMAN: Yes.
23 MR. ROBERT HALSAN: Already?
24 MR. FRIEDMAN: Yes.
20:47:31 25 MR. ROBERT HALSAN: Already. Goodness 99
□

20:47:32 1 gracious.
2 MR. FRIEDMAN: Thank you for your
3 comments.
4 Is there anyone else who has not
20:47:36 5 previously spoken who wishes to? Please come
6 up here, state your name, spell your name for
7 the record.
8 MR. MURRAY STANLEY: My name is Murray
9 Stanley, S-T-A-N-L-E-Y. And I would like to
20:47:51 10 talk a little bit -- I listened to corporate
11 America speak. (Indicating.) How about that?
12 Is that better?
13 MR. FRIEDMAN: Yes, especially when you
14 lean forward.
PM6-75 20:48:08 15 MR. MURRAY STANLEY: I pay attention to
16 corporate America and the stewardship of our
Page 83

Public Meetings

cont'd

PM6 RN-110807-FERCpm.txt

17 environment, and I don't know if you noticed
18 the paper, but Exxon Mobil is in our Supreme
19 Court right now, and the reason they're there
20:48:24 20 is because they do not want to pay the
21 \$2.5 billion that they were fined as -- for the
22 VALDEZ when it ran aground up in Williams Bay.
23 Now, they fined them \$2.5 billion.
24 They're in our Supreme Court refusing to pay it
20:48:51 25 and hoping that the Supreme Court will nullify
□ 100

20:48:55 1 that decision that they had to pay. That was
2 18 years ago, and they're still fighting it.
3 And by the way, Exxon Mobil made \$39 billion
4 last year. The most money by any corporation
20:49:17 5 in the United States to date, but they're not
6 paying.
7 Now, PG&E, they are 20 years behind on
8 their upgrades for emissions. They refuse to
9 do them. DEQ tries to chase them around, do
20:49:36 10 something. They're a toothless tiger. They
11 can do nothing with these people. When and if
12 a tanker runs aground, do you think that
13 they're going to fix things up for us? I don't
14 think so. So I just wanted to bring that point
20:49:53 15 to you people. If you think that NorthStar's
16 going to do us any favors, you're crazy. Thank
17 you.
18 MR. FRIEDMAN: Thank you for your
19 comments.
20:50:08 20 (Applause.)
21 MR. FRIEDMAN: Is there anyone else in the
Page 84

Public Meetings

Public Meetings

6

22 audience who has not previously spoken at a
 23 FERC meeting this week who wishes to speak
 24 tonight?

20:50:21 25 Okay. In that case I'm going to call the
 □ 101

20:50:23 1 people who previously signed up to speak at
 2 other meetings and give them one last chance.
 3 Laurie Caplan.

4 MS. LAURIE CAPLAN: I'm Laurie Caplan.

20:50:49 5 C-A-P-L-A-N.

PM6-76

6 Evidence proves that there will be
 7 substantial air and water pollution and
 8 environmental damage resulting from the
 9 construction and day-to-day operations at

PM6-77

20:51:03 10 Bradwood. So what will happen in an emergency?
 11 The Knappa Fire District has sole
 12 responsibility for emergency response and
 13 mitigation for incidents at Bradwood.

14 The fire district researched the four
 20:51:18 15 existing LNG terminal facilities in the United
 16 States, incidents at two LNG peak shaving
 17 plants in Oregon, and information from the
 18 Coast Guard and NorthernStar. In its testimony
 19 submitted last month to the Clatsop County

20:51:35 20 Commissioners, the fire district identified
 21 massive gaps in its resources.

22 More employees, vehicles, equipment,
 23 training, and a new fire station facility are
 24 needed to cope with just the, quote, predicted
 20:51:49 25 routine emergencies, unquote, at the terminal.

□

102

PM6-76 As discussed in sections 4.3 and 4.10.1, impacts on air and water quality would not be significant.

PM6-77 See our responses to comments PM1-1 and PM6-24.

Public Meetings

6

PM6 RN-110807-FERCpm.txt

PM6-77
cont'd

20:51:54 1 The report says this will not be enough to deal
2 with, quote, catastrophic incidents, unquote.
3 The report does not include resources needed
4 for emergencies on LNG tankers or along the
20:52:07 5 shipping channel or the proposed pipeline. The
6 report does not include resources needed by
7 other emergency responders such as police,
8 highway patrol, security, haz mat, and
9 ambulances.
20:52:22 10 The Knappa, Astoria, Warrenton, and
11 Clatskanie fire districts will need a total of
12 15 more full-time employees and six interns to
13 provide what the Knappa district calls a,
14 quote, conservative, effective response to
20:52:40 15 incidents at Bradwood Landing. The district
16 will need numerous annual trainings for
17 responders. It will need four specialized
18 fire, rescue, and communications vehicles, a
19 water craft, combustible, and/or multi-gas
20:52:56 20 detectors for all emergency vehicles and
21 personnel, satellite communications equipment,
22 and much more. The fire districts can't afford
23 these essential resources, and NorthernStar,
24 the Coast Guard, the State of Oregon, Clatsop
20:53:13 25 County, and the federal government have not
□ 103
20:53:15 1 offered to pay for them.
2 Environmental damage from even a routine
3 industrial accident at Bradwood could be
4 widespread, long term, and devastating. It's

Public Meetings

6

PM6-77
cont'd

20:53:26 5 PM6 RN-110807-FERCpm.txt
hard to imagine what the impact of a actual
20:53:43 10 catastrophe would be, especially without
massive spending for equipment, personnel, and
other resources. FERC must reject LNG at
Bradwood and protect the public and the
Columbia River from this foolhardy project.
11 Thank you.
12 MR. FRIEDMAN: Thank you for your
13 comments. Marge Castle.
14 MS. MARJIE CASTLE: Good evening. Marjie
20:54:00 15 Castle. M-A-R-J-I-E, C-A-S-T-L-E. This is my
fourth time to speak this week. Each time that
I have spoken, I have chosen a topic that I
have found deficient in the DEIS. Tonight I
speak because of information that was given out
last night by NorthernStar.
20:54:17 20 Thank you for this last -- one last
opportunity to publicly express my concerns of
the DEIS, as printed. I hold a degree in
biology, a Master's degree in technology, and
an advanced certification in brain research. I
20:54:30 25
20:54:33 1 am not an amateur to research, and I understand
the hours of commitment FERC staff and
third-party contractors have put into this
document.
20:54:41 5 As I stated last evening, though, it has
many, many holes, and I can't help but wonder
if that was done deliberately. If so, one's
imagination could run overtime as to why so
let -- to let imaginations fly. Many times

104

PM6 RN-110807-FERCpm.txt
 20:54:57 10 it's not imagination but reality that becomes
 11 the result.
 PM6-78 12 Mr. Friedman, you stated multiple times
 13 over the course of this week that landowners
 14 could go to NorthernStar to get an answer as to
 20:55:10 15 if the pipeline was on their property and at
 16 what mile marker. All my husband could get for
 17 an answer was, "The drill site is not on your
 18 property." We have lived with a drill site on
 19 our property, that proposal, for two years.
 20:55:26 20 The revised Cowlitz County geo hazard
 21 report supported our claims that we submitted
 22 to your organization that the hillside near the
 23 proposed site on our property to have been --
 24 was unstable and further recommend -- and it
 20:55:44 25 was further recommended by the geo hazard
 105
 20:55:47 1 report that three alternative placements for
 2 that drill site should be looked into.
 3 Two of those recommendations would have
 4 seriously increased costs to NorthernStar as
 20:55:55 5 well as required additional HDDs up the
 6 Abernathy Creek draw. The third alternative
 7 was to move the drill site from where it was
 8 currently sited to a more westerly situation.
 9 That would mean further up on top of the ridge
 20:56:12 10 within the association of homeowners to which
 11 we belong. That whole ridge has a different
 12 drainage and goes into a totally different
 13 creek system. Based on the neighborhood survey
 14 on feelings towards the proposed NorthernStar

Public Meetings

6

PM6-78 The proposed location of the pipeline route, including the route of the HDD borehole beneath the Columbia River, is shown in Appendix B of the final EIS. The route is the same as shown in the draft EIS. The location of the HDD borehole was chosen, in part, based on the results of a geotechnical study to ensure stability of the borehole and to minimize the potential for frac-outs to occur. Additional site-specific geotechnical investigations would be done and reviewed for compliance before construction would be allowed to begin in any areas exposed to significant geological hazards. Also see our response to LA7-25.

Public Meetings

6

PM6-78
cont'd

PM6 RN-110807-FERCpm.txt
 20:56:29 15 LNG project and location of another pipeline in
 16 our neighborhood, only one piece of property
 17 was left.
 18 The major horizontal drill site for
 19 placement of the 30-inch pipeline has been
 20:56:41 20 moved and not within just a few feet but
 21 possibly over the width of two parcels, or
 22 approximately 1,350 feet. That's a major
 23 change. As of tonight, Mr. Coppedge admitted
 24 NorthernStar does not even know where the drill
 20:56:56 25 site now will be.
 □ 106
 20:56:58 1 This is a major indication. This is the
 2 site to bring the pipeline under the Columbia
 3 River into Cowlitz County, Washington. Any new
 4 location -- any new location on that ridge has
 20:57:11 5 not been communicated to the landowners of that
 6 area. It will be located within a few feet of
 7 a year-round creek that feeds into Mill Creek,
 8 the last native salmon run creek on the
 9 Columbia River. Along each side of the unnamed
 20:57:30 10 creek wetlands exist. Eagles, owls, raccoons,
 11 deer, all kinds of animals live there.
 12 Because of all this information and other
 13 information that is conspicuously missing from
 14 the DEIS and because location change appears to
 20:57:45 15 have been known by FERC prior to the issuance
 16 of the DEIS, I therefore formally demand that
 17 all further discussion and consideration of
 18 this draft Environmental Impact Statement be
 19 stopped until all pertinent environmental, air

PM6-78
cont'd

20:57:58 20 PM6 RN-110807-FERCpm.txt
and water quality, road, safety, socioeconomic,
21 effective residential, and any other additional
22 necessary information is gathered and report
23 submitted for the change of the pipeline HDD
24 under the Columbia River drill site, and that
20:58:14 25 all pertinent agencies be allowed to review and
□ 107

20:58:18 1 comment and a new complete draft Environmental
2 Impact Statement released to the public for
3 further comment.

4 Thank you.
20:58:25 5 MR. FRIEDMAN: Thank you for your
6 comments.

7 (Applause.)
8 MR. FRIEDMAN: Duncan MacKenzie.
9 MR. DUNCAN MacKENZIE: Good evening. My
20:58:47 10 name is Duncan MacKenzie. D-U-N-C-A-N,
11 M-A-C-K-E-N-Z-I-E.

PM6-79

12 In the DEIS on page 2-23 is a discussion
13 of support facilities associated with the LNG
14 terminal, notably, the nitrogen system and the
20:58:59 15 pipeline associated above-ground facilities in
16 2 1.4. The applicant's resource reports one,
17 11, and 13 note that the nitrogen system will
18 produce nitrogen gas for purging pipes,
19 processing equipment, and vessels only.
20:59:14 20 However, nowhere in the DEIS nor the publicly
21 available resources or materials reviewed is
22 any mention of the need or method to be used to
23 adjust the higher heating value of the imported
24 gas to meet transmission specifications for

Public Meetings

6

PM6-79 The Commission issued its *Policy Statement on Provisions Governing Gas Quality and Interchangeability in Interstate Natural Gas Company Tariffs* (Policy Statement, PL04-3-000) in 2006. Consistent with the Policy Statement, NorthernStar must ensure that the regasified LNG it delivers to interconnecting pipelines meets the gas quality and interchangeability standards of the interconnecting pipelines' tariffs.

Public Meetings

6

PM6-79

cont'd

PM6 RN-110807-FERCpm.txt
 required interstate gas line transmission. 108

20:59:27 25

20:59:29 1 The only statement found as to the
 2 applicant's position with regard to this issue
 3 was summed up in a 25 July 2006 application by
 4 lawyers on page 24 and 25 as follows: Bradwood

20:59:39 5 Landing recognizes the importance of
 6 interchange ability, but submits that this
 7 concern does not require resolution prior to
 8 the approval of authorization it seeks.
 9 With the exception of Trinidad and Tobago,
 20:59:50 10 LNG produced around the world has an HHV value
 11 much higher than the natural gas as a source.
 12 The federal supply market facility would not
 13 seem to provide LNG at sufficiently low HHV to
 14 accomplish intact blending. Furthermore, there
 21:00:04 15 is a tendency for the HHV values to increase
 16 during the transport and delivery cycles as
 17 boil-off of the lighter hydrocarbons occurs.
 18 While liquified natural gas can be
 19 supplied with an adjusted HHV by the supplier,
 21:00:18 20 it is costly and decreases the flexibility of
 21 the shipper to supply a wide market.
 22 Currently, the Northwest Pipeline, Williams
 23 Pipeline transmission specifications do not
 24 appear to have a maximum HHV value, nor are a
 21:00:32 25 maximum or minimal Wobbe Index values given as 109

21:00:36 1 conditional supplies from Canada have been
 2 within acceptable ranges.
 3 This may account for the applicant's
 Page 91

Public Meetings

6

PM6-79
cont'd

PM6 RN-110807-FERCpm.txt

4 apparent lack of address to this issue.

21:00:42 5 However, if the Natural Gas Council + Group

6 guidelines developed in anticipation of

7 increasing West Coast LNG ports are adopted,

8 then the HHV will be limited to a maximum of

9 1110 BTUs a standard cubic foot and the Wobbe

21:00:58 10 Index will be required to be 4 percent of

11 historical values.

12 There are two aspects of this issue,

13 which, despite the applicant's protestations

14 noted above, would appear to require resolution

21:01:08 15 prior to approval or authorization. First, as

16 found on lines 30 through 36 of the submerged

17 combustible vaporizer data sheet and the air

18 contaminant discharge permit, the composition

19 of this fuel and the HHV value of 1068 BTUs per

21:01:27 20 standard cubic foot is found.

21 However, in the absence of the design

22 information or mention of how the manner of HHV

23 adjustment will be accomplished, how is the

24 applicant capable of assuring the Oregon

21:01:36 25 Department of Environmental Quality that the 110

21:01:38 1 stated fuel composition and HHV are correct and

2 are being held to the values stated? If these

3 values cannot be substantiated, the air

4 modeling quality and the emissions data might

21:01:49 5 be called into question.

PM6-80

6 Additionally, has the attendant noise and

7 potential cooling water demand of an air

8 separation unit for sufficient capacity for

Page 92

PM6-80 See our response to comment PM1-42. All significant noise sources were included in the acoustical model and are listed in table 4.10.2-4.

Public Meetings

6

PM6-80
cont'd

PM6 RN-110807-FERCpm.txt

9 nitrogen injection or compressor capacity for
 21:01:59 10 air injection adequately been accounted for in
 11 the applicant's submissions? As noted in the
 12 operation equipment list associated noise data
 13 found in the applicant's resource report nine
 14 and also in the DEIS, no air separation unit or
 21:02:17 15 compressors are noted.
 16 MR. FRIEDMAN: Duncan, wrap it up please.
 17 MR. DUNCAN MacKENZIE: Yep.
 18 It is requested that FERC recommend that
 19 the applicant address the manner in which HHV
 21:02:25 20 adjustment will be accomplished to equal a
 21 suitable Wobbe Index and to ensure that the
 22 anticipated emissions will conform to the
 23 submitted data contained in the air quality
 24 discharge permit and the FEIS; also, that the
 21:02:38 25 applicant review the application as to noise
 111

21:02:40 1 and water resources for their inclusion in the
 2 DEIS.
 3 Thank you for your time.
 4 MR. FRIEDMAN: Thank you for your
 21:02:46 5 comments.
 6 Next, Steve Dragich.
 7 MR. STEVE DRAGICH: Mr. Dragich, Dragich
 8 Trust. D-R-A-G-I-C-H. I have four items to
 9 submit tonight, and I'm also submitting my
 21:03:11 10 comments on the total DEIS.
 PM6-81 11 Item one: In September 7, 2005, an
 12 original list of 512 landowners was submitted
 13 to FERC by NorthernStar Energy Limited
 Page 93

PM6-81 See our response to comment PM1-17.

Public Meetings

6

PM6 RN-110807-FERCpm.txt

PM6-81
cont'd

14 Liability Corporation, legal representative
21:03:27 15 VanNess & Feldman, Washington, D.C. Copies
16 were sent to FERC and contractor Natural
17 Resources Group. At that time no CEII,
18 standing for critical energy infrastructure
19 information, was proclaimed; no privacy claim
21:03:44 20 invoked. All future requests from that date,
21 September 7, 2005, for landowner lists and
22 pipeline route maps were denied.

PM6-82

23 Item two: December 14, 2006, biological
24 assessment meeting on the Bradwood proposal
21:04:03 25 itself. No notification was given to 112
□

21:04:05 1 intervenors, and intervenors who were present
2 were denied attendance and no reasons as to why
3 they were denied attendance. In reference to
4 are ex parte communication, it is noted on the
21:04:16 5 meeting roster that FERC kept that John
6 Buchovecky, NorthernStar legal representative,
7 and Gary Coppedge, NorthernStar vice president,
8 were in attendance.

PM6-83

9 Item three: In the FERC manual title,
21:04:32 10 ideas for better stakeholder involvement, page
11 9, industry options, chapter title, Make route
12 information easy and understandable,
13 NorthernStar either has claimed exemption under
14 item four of the Freedom of Information Act or
21:04:49 15 CEII exemption under FERC rules 630.

PM6-84

16 One final comment: Since the end of World
17 War II, my family has helped provide security
18 for the lower Columbia, specifically river mile
Page 94

PM6-82 The referenced meeting was exempt from the FERC's ex-parte rules under §385.2201(e)(1)(vii) because it related to preparation of documentation under the NEPA. The Commission issued an Order to clarify this situation on February 16, 2007.

PM6-83 See our response to comment PM1-18.

19 50 to river mile 60. To give you an example of
21:05:07 20 how bad a plan can go, I refer to December 8th,
21 1941, which my family was involved in the
22 security after the attack on Pearl Harbor.
23 Specifically, my family, or my father and his
24 brothers, specifically his brothers, were part
21:05:24 25 of the United States Army, manned a machine gun 113
□

21:05:28 1 post on the peak of the Rainier bridge between
2 Longview, Washington, and Rainier, Oregon.
3 There was a general blackout in effect,
4 and their duty at that time was to provide
21:05:40 5 river security. A freighter approached upriver
6 in a blackout condition. Recognition signals
7 were misidentified. At the time they were
8 manning a 30-caliber machine gun post, which
9 they opened fire. Luckily, if you want to
21:06:05 10 extrapolate, just think what you could do with
11 a 30-caliber machine gun and an LNG tanker.
12 MR. FRIEDMAN: Thank you for your
13 comments.
14 John -- it's not working.
21:06:30 15 Okay. John Koehler. John?
16 MR. JOHN KOEHLER: Koehler?
17 MR. FRIEDMAN: Koehler, yes.
18 MR. JOHN KOEHLER: My name's John Koehler.
19 K-O-E-H-L-E-R. I live in the proximity of
21:06:47 20 where the rail head is going to be located in
21 Cowlitz County.
22 Since testifying last night, I talked with
23 NorthStar and found out that they are moving
Page 95

PM6 RN-110807-FERCpm.txt

PM6-85

24 the drill head location. They don't know where
 21:07:01 25 it is. So we're guessing somewhat, but I want 114
 21:07:07 1 it to be brought to your attention so that you
 2 can consider it when you're doing all your
 3 work, that some of that wetlands that Marjie
 4 Castle was referring to is my wetlands, and
 21:07:17 5 that on my property is a major spring. It
 6 provides approximately half the water flow of
 7 that unnamed creek she was referring to that it
 8 feeds down into, Coal Creek -- or into Mill
 9 Creek, which is a major salmon spawning ground.
 21:07:36 10 If they are locating their drill head in
 11 that area, you need to be aware -- you need to
 12 get someone out there, locate my spring and
 13 assess, with your expertise, the impact that
 14 that drilling may have on that spring, and that
 21:07:52 15 if they damage the spring, the impact it would
 16 have on the salmon.
 17 So, thank you.
 18 MR. FRIEDMAN: Thank you for your
 19 comments.

21:07:59 20 Next is Vance Fraser.

21 MR. VANCE FRASER: Hello. I'm Vance

22 Fraser. That's F-R-A-S-E-R.

23 As requested, let's look at some more

PM6-86

24 errors and deficiencies of the DEIS. Section
 21:08:24 25 1.1, purpose and need. The project is designed 115
 21:08:30 1 to provide up to 1.3 billion cubic feet per day

Page 96

Public Meetings

6

PM6-85 NorthernStar would work with property owners to identify wells and springs within and adjacent to the construction right-of-way and implement measures to protect such springs and wells as appropriate.

PM6-86 There is no evidence that the project would cause significant adverse impacts on the shipping or fishing industries of the lower Columbia River. See sections 4.7.1.4 and 4.8.1.7. It is possible that, if authorized and built, the Bradwood Landing Project may be under-utilized during certain periods, and would not always deliver up to its maximum capacity. Existing LNG import terminals on the East and Gulf Coasts of the United States on occasion operate at about 40 percent of capacity.

PM6-86

cont'd

2 PM6 RN-110807-FERCpm.txt
to the Pacific Northwest. Apparently, lessons
3 learned from the advertising industry are
4 necessary to justify this project. Provide gas
21:08:44 5 up to 1.3 BCFD. So that "up to" can mean
6 almost zero, with the rest going elsewhere, and
7 the risk and damage to the fishing industry and
8 shipping industry remain here.

PM6-87

9 The DEIS continues on about delivery of
21:08:58 10 gas to Wauna and the Beaver power plant. There
11 is no reason to believe that these plants will
12 not have energy without LNG. They are fully
13 supplied right now.

14 Now, it, the DEIS, goes on about
21:09:14 15 connecting to Northwest Natural and Williams
16 pipeline, but no real and actual demand, just
17 magical future demand described in the industry
18 self-serving Northwest Gas Association
19 projections, which fall apart compared to the
21:09:30 20 less biased Energy Information Agency
21 projections.

22 With electrical generation and industrial
23 use of the gas far exceeding other uses in this
24 region, and with the trend of industry leaning
21:09:46 25 to be China and elsewhere, where is this big
□ 116

21:09:49 1 need and demand coming from? Well, electrical
2 generation. And let's see exactly what, where,
3 and how much that will be going in the DEIS,
4 please.

PM6-88

21:10:02 5 Still, in section 1.1 it states that
6 imported LNG will contribute to gas price

Page 97

Public Meetings

6

PM6-87 The Bradwood Landing Project would provide an alternative source of natural gas for the Wauna Mill and Beaver Power Plant.

PM6-88 The comparison is not accurate because oil has previously been imported and the United States receives the majority of its oil from domestic or Canadian sources. However, the United States is currently experiencing more demand for natural gas than it can adequately produce domestically or import via the existing natural gas transmission pipeline infrastructure.

PM6-88

cont'd

7 PM6 RN-110807-FERCpm.txt
 8 stabilization. We have seen how well that has
 9 worked for other foreign imported energy, which
 10 arrives by ship. What is the price of crude
 21:10:19 11 oil today? You can strike that one from the
 12 justification.

PM6-89

12 The DEIS goes on to state that there has
 13 been and will continue to be increasing demand
 14 for natural gas in U.S. and in the Pacific
 21:10:34 15 Northwest. This is purely speculative
 16 conjecture. As soon as a cheaper or a more
 17 attractive alternative comes along, we will be
 18 stuck with this big piece of crap and this
 19 pipeline unless FERC requires a reasonable
 21:10:50 20 abandonment plan.

21 The DEIS cites the Northwest Gas
 22 Association -- Association that the Northwest
 23 will fall short of peak demand under a
 24 high-growth-demand scenario or under a
 21:11:05 25 base-case scenario with extreme cold weather

117

21:11:10 1 conditions. Now, since many Californians have
 2 got tired of the rain, where is this
 3 high-growth demand going to come from? And
 4 since Al Gore has assured me of global warming,
 21:11:22 5 just exactly what temperature and for how long
 6 does extreme cold weather mean?

7 Thank you.
 8 MR. FRIEDMAN: Thank you for your
 9 comments.

21:11:35 10 Gayle Kiser.

11 MS. GAYLE KISER: Nice to see you all

Public Meetings

6

PM6-89 Section 1.1 includes a revised discussion of the purpose and need of the proposed project. Section 2.9 has been revised to include a discussion of NorthernStar's decommissioning plan that was submitted to Clatsop County and the State of Oregon.

PM6-90 12 PM6 RN-110807-FERCpm.txt
 13 again. Gayle Kiser. G-A-Y-L-E, K-I-S-E-R.
 14 I'd like to come to the defense of
 15 Dr. Havens. I have here some statements by
 21:11:57 16 Richard Kuprewicz, who's a member of the
 17 Washington State Commission on Pipeline Safety
 18 and also the Pipeline Safety Trust. He talks
 19 about a serious fatal flaw in FERC's siting
 20 process, concerning LNG marine facility siting.
 21:12:13 21 Some serious deceptions representative of very
 22 poor, even reckless, risk management that I
 23 have observed in the siting process, quote, for
 24 LNG marine receiving as well as gas
 25 transmission pipelines.
 21:12:26 26 For LNG facilities, watch out for 118
 21:12:29 1 misinformation indicating, quote, the
 2 worst-case release will be a pool release, end
 3 quote. Experienced hazard analysis teams call
 4 this phenomena "stacking the deck." By
 21:12:42 5 constraining the review to the very restricted
 6 limited boundary case, real possible events are
 7 not properly analyzed, scrutinized, or properly
 8 engineered, and risks are those seriously
 9 understated. This isn't a new phenomena; talk
 21:12:58 10 to the Three Mile Island designers.
 PM6-91 11 And also, reverting back to the DEIS, on
 12 pages 4-443 and 4-444, we're discussing the
 13 causes of pipeline failure. On table 4.11.9-3,
 14 it says that earth movement accounts for 13.3
 21:13:23 15 percent of the failures. Those are nationwide
 16 figures. In Cowlitz County, earth movement

Page 99

Public Meetings

6

PM6-90 The modeling approach used by FERC employed during project review included the best available methods and in areas of uncertainty, used conservative assumptions. Also, the GAO Report (GAO 2007) presented a survey of experts who work in areas related to LNG risk, hazards, and consequence modeling. The report determined that the primary hazard to the public would be heat from a fire. A total of 11 of 15 experts were of the opinion that current methods for estimating LNG fire heat hazard distances are "about right" or too conservative.

PM6-91 For pipelines of this size we look at national risk rates for pipeline failure. We acknowledge that Cowlitz County has geologically unstable areas; however, this is an acceptable incremental risk.

PM6-91

cont'd

17 PM6 RN-110807-FERCpm.txt
accounts for 100 percent of pipeline failures.

18 This is going to be a 30-inch pipeline in

19 Cowlitz County, carrying 1280 pounds per square

21:13:39 20 inch. The blast zone will be 741 feet on

21 either side. That wipes out a quarter mile.

22 In 1995, the Williams pipeline blew in Castle

23 Rock. In 1997 the Williams pipeline blew in

24 Kalama. On December 13 of 2003 it blew up in

21:13:57 25 Toledo. Those were all due to land movement.

119

PM6-92

21:14:01 1 In 2006 a 36-inch pipeline in Wyoming blew up

2 and sterilized 600 acres. Totally blew the

3 topsoil away.

4 The existing KB pipeline which traverses

21:14:15 5 Cowlitz County is above ground near my house.

6 The neighbor there had to move because of the

7 land movement. He had to move his home because

8 of land movement. So I have serious concerns

9 about locating this pipeline in Cowlitz County,

21:14:29 10 and I hope FERC takes the geologic hazard

11 report very seriously.

12 Thank you.

13 MR. FRIEDMAN: Thank you for your

14 comments.

21:14:39 15 At this time we've gone through the list

16 of everyone who wanted to speak. Frans, go

17 ahead.

18 MR. FRANS EYKEL: Mr. Friedman, I have to

19 catch the ferry, so I'll be very quick. My

21:14:48 20 name is Frans Eykel. E-Y-K-E-L. Good evening

21 again.

Page 100

Public Meetings

6

PM6-92

It is generally standard practice to collocate new natural gas pipelines with existing utilities. However, in the case of the KB pipeline, NorthernStar recognizes that some areas of the route cross geologically unstable areas. Therefore, the Bradwood Landing pipeline would avoid the unstable areas, or in some cases, potential landslide areas would be crossed using the HDD method.

PM6-93

22 PM6 RN-110807-FERCpm.txt
I have two -- three comments here. I'd
23 like to comment on a statement from a gentleman
24 here earlier this evening. He stated that LNG
21:15:07 25 cannot explode. LNG can explode, due to rapid
□

120

21:15:13 1 expansion. When -- LNG is built in water, it
2 will explode with an equivalent of a couple of
3 pounds of TNT. That is well-known in the
4 industry.

21:15:27 5 Secondly, the personal attack on
6 Dr. Havens' credibility, I was appalled and he
7 requires an apology.

PM6-94

8 Third, should FERC not stop all the
9 activity on this permit application until all
21:15:47 10 the documents are compiled and can put
11 everything into the draft EIS so we can read
12 only one book instead of 20 or 30 different
13 documents that still need to be filed, like
14 corrections on the biological assessment and
21:16:08 15 thermal mixing, the filter for the water
16 intake, which is stopped secret because they
17 don't even know how to do it yet, and so many
18 other things. If you start -- if you permit
19 someone to do something, it should be all up
21:16:28 20 front, not through the back door.

21 That's all I got. Have a nice day, Paul.

22 MR. FRIEDMAN: Thank you, and have a safe
23 ferry trip.

24 Is there someone else who wants to speak?

21:16:39 25 Please come up to the front, state your name,
□

121

Public Meetings

6

PM6-93

See section 4.11.1 for a discussion of a rapid phase transition (RPT) that can occur when LNG is spilled onto water.

PM6-94

Detailed studies do not need to be completed before we issue the EIS, or before the Commission makes a decision about the project. There are some studies, like archaeological surveys and geotechnical investigations, that cannot be done until after a Certificate is issued and NorthernStar could obtain access to parcels previously denied. Therefore, we have made numerous recommendations that require detailed studies, designs, and other extensive coordination efforts to be completed after the FERC Order, but before we allow construction to begin. The EIS discloses what information may be lacking, how we would account for potential project impacts on specific resources in those situations, and general conceptual measures that would be finalized later to mitigate impacts. Also, mitigation measures would be required by other agencies with permitting or regulatory authorities, such as the BOs to be issued by the FWS and NMFS, and wetlands permit to be issued by the COE.

PM6 RN-110807-FERCpm.txt

21:16:41 1 and spell your last name for the record.
 2 MR. MARVIN KING: (Indicating.)
 3 MR. FRIEDMAN: Well, she doesn't remember.
 4 MR. MARVIN KING: My name is Marvin King,
 21:16:47 5 and I'm against this for myself and the rest of
 6 my future generation and everything else.
 7 Anybody that's for this project should
 8 have to live on the pipeline or buy property
 9 right next to the pipeline. I didn't hear
 21:17:00 10 anybody in favor that said -- one person that
 11 said they were going to be affected by it.
 12 There are so many problems with the
 13 proposed site that one doesn't really know
 14 where to begin. Let's start with the DEIS.
 PM6-95 21:17:09 15 Oh, wait, it's incomplete and won't be able to
 16 changed until after all public comments and
 17 reviews have been made. I would like to take
 18 this time to ask FERC for an additional 120-day
 19 comment period until after a complete DEIS has
 21:17:24 20 been submitted.
 PM6-96 21 I guess safety should be at the top of
 22 list. NorthernStar has gone to great lengths
 23 to assure all of us that we are out of harm's
 24 way. This could not be further from the truth.
 21:17:34 25 The double-tank design was found to be
 □ 122
 21:17:36 1 inadequate by our own Pentagon. L. Hunter
 2 Lovins on energy security concluded, and I
 3 quote: Proneness to brittle fracture implies
 4 that relatively small disruptions by sabotage,
 21:17:42 5 earthquake, objects flung at the tank, et
 Page 102

Public Meetings

6

PM6-95 See our response to comment PM4-20 and PM5-26.

PM6-96 As discussed in section 4.11.3, the LNG storage tanks would be full containment tanks. The inner tank would be constructed of 9 percent nickel steel and the outer tank would be constructed of pre-stressed concrete. Both of those materials are designed to withstand cryogenic temperatures and are not prone to brittle fractures. constructed with pre-stressed concrete

PM6 RN-110807-FERCpm.txt

PM6-96

cont'd

6 cetera, could well cause immediate, massive
 7 failure of an above-grade LNG tank. A General
 8 Accounting Office study similarly concluded
 9 that tanks afford limited protection even
 10 against non-military small arms projectiles.

PM6-97

11 There are hundreds, if not thousands of
 12 locations that a one-eyed, one-armed, uneducated
 13 terrorist could destroy a tank from. Maybe we
 14 should all have to have a background check to
 15 go into the woods or stay at the Cannery Pier
 16 Hotel at Astoria. These ships will go within
 17 100 yards of this hotel, where a terrorist
 18 could rent a room at.

19 How about the Astoria Megler bridge? How
 20 many times will it be shut down while LNG is
 21 going underneath? I can just picture the
 22 terrorists laughing as they pull the pin from
 23 the grenade as they throw it from the bridge.
 24 "Oh, FERC, they made it so easy for us."

21:18:40 25 The terrible thing is an LNG tanker

123

21:18:43 1 carries 700 tons of TNT, or 5500 times the
 2 atomic bomb that destroyed Hiroshima. That's
 3 disturbing. An LNG explosion in Cleveland in
 4 1944, which left 128 dead and over 200 injured,

21:18:58 5 contained only 5 percent of the volume of
 6 today's tankers. Why does the government and
 7 FERC have to wait until catastrophic failure
 8 and death to realize this?

PM6-98

9 The FERC relies heavily on independent
 10 studies which are inaccurate and misleading.
 Page 103

Public Meetings

6

PM6-97

Based on an analysis of risk and site specific conditions, the Coast Guard determined that closure of the Astoria-Megler Bridge during transit of an LNG vessel would not be necessary. Section 4.11.8 presents a discussion of terrorism and security issues. The 1944 Cleveland incident was directly related to flaws in the LNG tank design, not the volume of LNG.

PM6-98

A discussion of the hazards, along with site-specific modeling, associated with a release of LNG from the storage tanks or LNG carriers is presented in section 4.11. Hazard distances are based on site specific modeling, which is dependent on a number of factors, including the size of the spill. A generic statement saying that for all credible spills, the danger zone for humans extends almost 2 miles is inaccurate.

PM6-98
cont'd

PM6-98 RN-110807-FERCpm.txt

11 Quest of Oklahoma concluded after the September
12 11th attacks that the immediate dangers to
13 humans and life from an LNG carrier, only 470
14 feet. Dr. James Fay, scientist from MIT,
21:19:22 15 disputes these findings were never subject of a
16 peer review or submitted to a scientific
17 journal. Dr. Fay says, and I quote: For all
18 credible spills, including terrorist attacks on
19 the storage tank and/or LNG tanker, the danger
21:19:36 20 zone for humans extends nearly two miles, end
21 quote. This is significantly different than
22 the Quest findings.
23 After doing minimal research, one can
24 learn of the LFL, or low flammability level, of
21:19:50 25 this particular gas. Because of its LFL, 124
□

21:19:53 1 studies have shown the release of 125,000 cubic
2 meters could create a vapor cloud of up to 30
3 miles before ignition. How can FERC ignore and
4 deny all of these studies done by our own
21:20:06 5 government of the dangers and effects of LNG to
6 humans and the environment I will never
7 understand.

PM6-99

8 Oregon and Washington have millions of
9 acres of secluded forests and unpopulated
21:20:18 10 areas. If FERC is going to allow these plants
11 to be built, they should not come within 50
12 miles of any population whatsoever.
13 MR. FRIEDMAN: Sir, please wrap it up.
14 MR. MARVIN KING: I would love to tell you
21:20:28 15 of every single LNG accident and explosion in
Page 104

Public Meetings

6

PM6-99 Section 3 of the Natural Gas Act does not preclude siting an LNG terminal in a populated area and an LNG terminal requires proximity to a deep navigation channel for LNG ship access. Also see our response to comment PM5-8.

Public Meetings

6

PM6 RN-110807-FERCpm.txt

16 the world, but FERC has put the quality of all
 17 of our lives into a three-minute speech. Go
 18 figure.
 19 MR. FRIEDMAN: Thank you for your
 21:20:40 20 comments.
 21 (Applause.)
 22 MR. FRIEDMAN: Is there anyone else that
 23 wishes to speak? If not, at this time --
 24 MS. CHERYL JOHNSON: I'm coming.
 21:20:52 25 MR. FRIEDMAN: Three minutes, Cheryl.
 □ 125

21:20:54 1 MS. CHERYL JOHNSON: Cheryl Johnson,
 2 Astoria.
 3 I would like to take this opportunity to
 4 thank Congressman Wu, who repeatedly and
 21:21:00 5 persistently requested from FERC to extend the
 6 comment period for this draft Environmental
 7 Impact Statement. If it were not for his
 8 persistence, this would all have been finished
 9 a long time ago. His first request was denied,
 21:21:12 10 second request was denied, and he continued to
 11 be persistent. He was finally successful and
 12 it extended from 45 days to 120. We would like
 13 to thank Congressman Wu for speaking up on
 14 behalf of the citizens of Oregon.
 21:21:27 15 MR. FRIEDMAN: Thank you.
 16 This is not working. I'll have to speak
 17 loud.
 18 On behalf of the FERC, I want to thank you
 19 all for being here tonight, providing comments
 21:21:39 20 on the DEIS for the Bradwood Landing LNG
 Page 105

Environmental Services

SEP 07 2007

Ms. Kimberly D. Bose
Secretary
Federal Energy Regulatory Commission
888 First Street, N.E., Room 1A
Washington, D.C. 20426

SUBJECT: OEP/DG2E/Gas 3, Bradwood Landing LLC, NorthernStar Energy LLC, Docket No. CP06-365-000, CP06-366-00, FERC/EIS - 0214D, et al.

Dear Ms. Bose:

Thank you for the opportunity to review and comment on the Draft Environmental Impact Statement (DEIS) for the above listed project.

- FA1-1 From the information contained in the DEIS there appears to have been a lack of active "government-to-government" consultation with all affected tribal governments. This lack of effective communication has led to the DEIS not fully addressing significant concerns of affected tribal governments, including protection of tribal trust assets and related mitigation measures.
- FA1-2 Based upon the Bureau of Indian Affairs (BIA) knowledge of the Project area, the DEIS does not adequately represent the significant concerns of the affected minority (Native American) and low income community in the Project area. Additionally, the cumulative impact of the planned full build out of the "Bradwood" Project and its connection with future power plants (gas and coal fired) needs additional analysis.
- FA1-3
- FA1-4 The DEIS is somewhat confusing in that it makes statements that NorthernStar "would implement" or "could implement" certain actions and in other parts of the DEIS suggests actions NorthernStar should take. For clarity, the DEIS should affirmatively state actions NorthernStar agrees to take and will be held responsible for completing.
- FA1-5 To get the information needed for a Final Environmental Impact Statement (FEIS), it is recommended that FERC provide "government-to-government" consultation meetings with the affected tribal governments listed on page 4-363 of the DEIS and the additional affected tribal governments: Quinault, Colville, and the Kootenai Tribe of Idaho (addresses listed below).

Federal Agencies

1

- FA1-1 Section 4.9.3 of the EIS documents government-to-government consultations between the FERC and Indian tribes that may have an interest in the project. The FERC sent its NOI to appropriate Indian tribal governments. Only the Nez Perce Tribe and the Confederated Tribes of the Warm Springs Reservation requested direct consultations with the FERC. Staff made presentations to the CRITFC on November 17, 2005, and to the Warm Springs Tribal Council on January 24, 2006. Members of the Nez Perce Tribal Council were in attendance during our presentation to the CRITFC. In addition, representatives from the CRITFC and the Nez Perce Tribe attended interagency and public meetings held for this project.
- FA1-2 Based on our analysis of the regional population, the project would not disproportionately impact minorities, including Native Americans, or low income communities (see section 4.8).
- FA1-3 The EIS discusses NorthernStar's intent to connect with the Beaver Power Plant. If the LNG terminal is expanded in the future (i.e., a third tank added) another assessment of environmental impacts related to that action would be required. Cumulative impacts are discussed in section 4.12.
- FA1-4 The FERC's environmental staff makes recommendations in the EIS using the phrasing "should." If the project is approved by the Commission, these recommendations would become conditions of the FERC's authorization for the LNG terminal and the certification for the pipeline. All of our recommended mitigation measures are summarized in section 5.2. Our recommendations are not the same as future actions that NorthernStar has committed to doing in their application and supplemental filings, which we describe using the phrasing "would." See response to comment PM1-2.
- FA1-5 To our knowledge, the Quinault, Colville, and Kootenai Tribe of Idaho did not prehistorically or historically occupy or utilize the project area (see Wayne Suttles, vol. ed., 1980, Northwest Coast, Handbook of North American Indians, Vol. 7, Smithsonian Institution, Washington, DC). Nor does it appear that these particular tribes have treaty rights extending over the lower Columbia River basin. Bands forming the Quinault tribe occupied the Queets, Clearwater, Quinsalt, and Copalis River drainages in the southwestern corner of the Olympic peninsula in west-central Washington state. The bands of Confederated Tribes of the Colville Indian Reservation occupied the upper Columbia River valley in central and eastern Washington. Kootenai bands occupied a territory in southeastern British Columbia, northwestern Montana, and northern Idaho. The Oregon and Washington SHPOs, the Legislative Commission on Indian Affairs for Oregon, and the Washington Governor's Office of Indian Affairs did not identify the Quinault, Colville, or Kootenai as tribes that we should contact. Although our NOI for this project was sent to regional agencies and Native American organizations, including the Affiliated Tribes of Northwest Indians, Northwest Indian Fisheries Commission, CRIFC, and the BIA, none of those organizations or agencies responded to the NOI with a request that the FERC should consult with the Quinault, Colville, or Kootenai tribes. Information regarding the Bradwood Landing Project has been available in the regional press for years. None of these three tribes have provided comments or contacted the FERC about the project.

K-340

K-341

FA1-5 cont'd To facilitate collaborative communication with tribal governments, it is suggested that you request the tribes designate a staff member as the official contact person to receive meeting notices and information regarding the project. It is also suggested that tribal technical staff be invited to meetings involving technical issues. Additionally, as courtesy, tribal leaders should receive duplicate copies of all information sent to the staff contact person. For scheduling purposes, tribal leaders and staff need notice of meetings as early as possible.

The above listed tribal governments have co-management responsibility over the natural resources in the Project area and must be involved in deliberation and planning on issues that impact tribal treaty resources. As such, their authority over resource allocation, river operation requirements, environmental quality, including air and water quality issues, etc., should be noted in the FEIS.

FA1-6 For your general information, because tribal governments are just that - governments, merely sending one Notice of Intent to Prepare an Environmental Impact Statement (NOI) to a tribal government does not necessarily mean a response will be made on the NOI. Because of tight budgets and staffing issues, unless a "government-to-government" meeting is specifically requested, tribal governments tend to wait to see the published DEIS and then make comments as necessary.

The following are further DEIS related comments:

FA1-7 • Safety and security zones for LNG vessels may have an adverse impact on tribal treaty rights. Mitigation measures should be addressed.

FA1-8 • The DEIS states that the geology of the project area "can be characterized as a "High" hazard area relative to earthquake potential" and "... is susceptible to soil liquefaction." See 5.1.1 Geology 5.1. The Project expects to fix these problems with "engineered fill." More information is needed concerning what materials will be used as "engineered fill."

FA1-9 • Under 5.1.2 Soils and Sediments, what is planned for the remaining 300,000 cubic yards of dredge material? "Beach nourishment" material could have an adverse impact on fish and wildlife and reduce harvesting opportunities. Mitigation measures should be addressed.

FA1-10 • What amount of the dredge material is expected to be placed back in the river? Because the Project wants to remove additional dredge material, "about 80,000 cubic yards of dredge material ... approximately every 2 to 4 years," what environmental review is anticipated for this activity?

FA1-11 • The DEIS states that "[i]f trace amounts of some contaminants were found in the sediment samples." 5.1.2 Soils and Sediments. Discussion is needed concerning the concentration of the "contaminants" caused by stockpiling the dredged material and the potential adverse impacts to the "beach nourishment" and water quality. More analysis is needed and mitigation measures addressed.

FA1-12 • Under 5.1.3 Water Resources, the Project is expected to use up to "60 million gallons of water from the Columbia River for hydrostatic testing of LNG storage tanks" and then release/discharge the water directly back into the Columbia River "approximately 300 feet offshore." Because of possible contaminants in the storage tanks and pipeline

Federal Agencies

1

FA1-6 See section 4.9.3 of the EIS.

FA1-7 We do not believe that other river users would be adversely impacted by the safety and security zones for the LNG carriers (see sections 4.7.1.4, 4.8.1.7, and 4.8.1.8). Fishing boats may need to temporarily move out of the way for several minutes as an LNG carrier passes.

FA1-8 Section 4.1.3.3 describes mitigation for soil liquefaction at the LNG terminal in greater detail than section 5.1.1. The currently proposed mitigation technique for soil liquefaction is soil densification using vibroflotation. Silts and clays within the top 25 feet would be replaced with compacted engineered fill. It is standard construction practice to replace fine grained soils with granular soils (e.g., sand or pea gravel) that can meet engineering specifications for compaction (i.e., "engineered fill"), regardless of the potential for soil liquefaction. Section 5.1.1 has been reworded for greater clarity relative to this issue.

FA1-9 The dredged material that is used for beach nourishment would replace sand that has eroded from an existing beach area at the Wahkiakum County Sand Pit site. This would be a beneficial use of the dredged sand to mitigate ongoing erosion caused by the presence of upstream dams which have removed sediment from the river's natural system. Dredged material has previously been placed at the Wahkiakum County Sand Pit site to counteract the effects of shoreline erosion (see section 3.1.9.2). Impacts of the dredged material placement on aquatic resources are discussed in section 4.5 and impacts on wildlife (streaked horned lark) are discussed in section 4.6.2.2.

FA1-10 With the exception of approximately 20,000 cubic yards, dredged material that is placed at the Wahkiakum County Sand Pit site for beach nourishment would essentially be placed in the Columbia River. This includes the material removed for maintenance dredging. Permits for maintenance dredging cover a 5-year period. The environmental assessment for the first permit is included in the EIS, which will be considered by the COE along with the Joint Permit Application submitted by NorthernStar for permits under section 404. Subsequent maintenance permits would require a separate environmental review by the COE.

FA1-11 The concentrations of contaminants detected in the sediments to be dredged are described in detail in section 4.2.2.2. Because the concentrations were very low, and in most cases are consistent with background levels, no mitigation is necessary.

FA1-12 Because the tanks and pipeline would be constructed of new materials, contaminants are not expected to be introduced to the hydrostatic test water during testing. However, all batches of hydrostatic test water would be sampled and analyzed before discharge and treated as necessary to enable safe discharge to the river. Hydrostatic test discharges would meet ODEQ standards and NPDES permit requirements.

K-342

- FA1-13 system, the water released back into the Columbia River should be filtered.
- FA1-13 • Withdrawals from the Columbia River of "approximately 13.7 million gallons per year for weekly fire suppression system testing" appear to have the potential for adverse impacts to fish and wildlife. More analysis is needed and mitigation measures addressed.
 - FA1-14 • Under 5.1.3 Water Resources, "[d]uring operation of the LNG terminal, the SCVs would generate about 160 gpm that would be discharged into the Columbia River under an NPDES permit following pH adjustment." Description of the potential content of the discharge water is needed and mitigation measures addressed. To identify possible water quality issues as early as possible, all water that leaves the Project site should be under a water quality monitor program.
 - FA1-15 • All studies cited in the DEIS should have a footnote concerning location where the document can be reviewed and the specific page in the Appendices to obtain the full citation of any particular study.
 - FA1-16 • Under 5.1.3 Water Resources, "SCV discharge water would be generally warmer than ambient water temperatures...." How much warmer? Explain how and why the water temperature will "not exceed" 68 degrees F? If the temperature goes above 68 degrees F, what protection measures will happen and how will notice happen?
 - FA1-17 • Under 5.1.3 Water Resources, along the proposed 36.3 miles long pipeline route there are "94 waterbody crossings" planned and a bridge over Hunt Creek to be replaced. More analysis is needed concerning impacts to fish and wildlife. Mitigation measures need to be addressed.
 - FA1-18 • Under 5.1.4 Wetlands and Terrestrial Vegetation, mitigation needs to be addressed concerning both the loss of 13 acres of wetlands and for the temporary loss of wetlands.
 - FA1-19 • Under 5.1.4 Wetlands and Terrestrial Vegetation, a better or more complete justification is need to justify a 100-ft right of way rather than just a statement of "we believe" it necessary.
 - FA1-20 • Under 5.1.4 Wetlands and Terrestrial Vegetation, the DEIS refers to a draft "Mitigation Plan." Impacted tribal governments should receive a copy of this draft plan and in the Mitigation process be consulted on a "government-to-government" basis.
 - FA1-21 • Concerning contaminant concentrations within the dredge material, there is a conflict between 5.1.2 Soils and Sediments, 5-3 and 5.1.5 Wildlife and Aquatic Resources, 5-6. On page 5-3 there were contaminant concentrations and on 5-6 there "are not" contaminant concentrations. This needs to be clarified and mitigation measures addressed.
 - FA1-22 • The Environmental Justice Act analysis is lacking and needs more work. The DEIS does not adequately address the disproportionately high and adverse environmental effects on the minority (Native Americans) and low income communities in the Project area.
 - FA1-23 • There is a need for additional analysis of impacts to estuarine functions during construction and operation. Proposed mitigation measures need to be addressed.
 - FA1-24 • Dredging of 700,000 cubic yards of sediment for the ship berth and maneuvering area appear to have the potential for adverse impacts to fish and wildlife. More analysis is needed and mitigation measures addressed.
 - FA1-25 • Under 5.1.5 Wildlife and Aquatic Resources, 5-7, talks about \$50 million over the "life of the project." For clarification purposes, the life of the Project should be stated.
 - FA1-26 • Under 5.1.9 Cultural Resources, the Project area does have religious, cultural, and sacred sites, including burial sites. This section is not complete and needs additional

Federal Agencies

1

- FA1-13 As described in section 4.3.2.3, the water withdrawn for fire suppression system testing would be cycled through the system piping and discharged back to the river without any other use. No adverse impacts on water quality or scouring of the river bottom would occur. The firewater intakes at the LNG terminal that withdraw water from the Columbia River would be screened to minimize the likelihood of entrainment and impingement of juvenile fish in accordance with the ODFW and NMFS regulations and fish design criteria. The screen designs proposed by NorthernStar have been reviewed and approved by the NMFS. Therefore, no impacts on fish and wildlife are expected and no mitigation would be necessary.
- FA1-14 The SCV discharge would be monitored in accordance with the NPDES permit issued by the ODEQ. Further discussion of the SCV discharge, as described in a technical memorandum titled Mixing Zone Analysis of Bradwood Landing Point Source Discharges – NorthernStar Natural Gas, has been added to section 4.3.2.3. NorthernStar filed its Mixing Zone Analysis for Bradwood Landing Point Source Discharges – NorthernStar Natural Gas with the FERC on October 15, 2007. This document is available for viewing by the public on the FERC's Internet web page at www.ferc.gov, through the eLibrary link, selecting "General Search," entering the docket number minus the last three digits (i.e., CP06-365), and putting in the proper date range. Constituents that would be present in the SCV discharge are listed in this technical memorandum, which is included as comment A4.
- FA1-15 Complete citations for all references cited in the EIS are provided in Appendix H. In addition, we have provided footnotes for certain key documents that are available on the FERC's internet website.
- FA1-16 A detailed discussion of the temperature of the SCV discharge relative to the ambient temperature of the Columbia River is provided in section 4.3.2.3. The SCV discharge is not expected to exceed 68 °F because it is part of a controlled, engineered process, and an alarm would sound in the control room if the temperature were to exceed 68 °F so corrective action could be taken. The temperature of the SCV discharge would be monitored and reported to the ODEQ as part of the NPDES permit requirements.
- FA1-17 Sections 4.5 and 4.6 contain detailed discussions of potential impacts on fish and wildlife associated with waterbody crossings and the new Hunt Creek Bridge. As discussed in section 2.1.5, NorthernStar's revised Compensatory Mitigation Plan will be included in the FERC's revised BA and EFH Assessment. Directions for accessing NorthernStar's Compensatory Mitigation Plan via the eLibrary can be found in the response to comment PM6-11.
- FA1-18 Compensatory mitigation for wetlands is discussed in section 4.4.1.2 for the terminal site and in section 4.4.1.3 for the pipeline. Mitigation for temporary impacts on wetlands is not required.

Federal Agencies

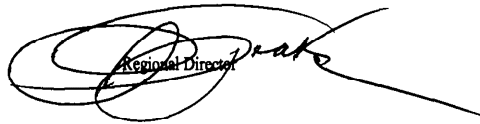

1

- FA1-19 NorthernStar's request for a wider right-of-way in wetlands is necessary and justified for seven reasons, as described in section 4.4.1.3.
- FA1-20 NorthernStar submitted its Mitigation Plan – 3rd Revision for the Bradwood Landing Terminal and Pipeline to the FERC on August 3, 2007. Directions for accessing NorthernStar's Compensatory Mitigation Plan via the eLibrary can be found in the response to comment PM6-11. NorthernStar is currently revising its Compensatory Mitigation Plan, which will be included in the FERC's revised BA and EFH Assessment. NorthernStar is developing its mitigation plan in consultation with the NMFS, FWS, and state agencies. The Compensatory Mitigation Plan is not a FERC proposal. See also our response to FA1-1.
- FA1-21 Section 5.1.2 states that trace amounts of some contaminants were detected in sediments but none exceeded threshold levels that would have an adverse impact on aquatic species and section 5.1.5 states that sampling and analysis did not detect any elevated contaminant concentrations that could adversely affect aquatic species. These statements are consistent and, furthermore, indicate that mitigation measures are not needed. Section 4.2.2.2 describes the sediment sampling and analysis results in detail.
- FA1-22 As discussed in section 4.8, we do not agree that the project would have disproportionately high and adverse impacts on minority and low income communities in the project area.
- FA1-23 Section 4.4.1.1 and 4.4.1.2 contain detailed discussions of potential impacts on estuarine function due to construction and operation of the project. As discussed in section 2.1.5, NorthernStar's revised Compensatory Mitigation Plan will be included in the FERC's revised BA and EFH Assessment. Directions for accessing NorthernStar's Compensatory Mitigation Plan via the eLibrary can be found in the response to comment PM6-11.
- FA1-24 Sections 4.5 and 4.6 contain detailed discussions of potential impacts on fish and wildlife associated with the removal of 700,000 cubic yards of sediment for the maneuvering area and ship berth. NorthernStar will develop a revised Compensatory Mitigation Plan to mitigate for impacts on fish and wildlife. As discussed in section 2.1.5, NorthernStar's revised Compensatory Mitigation Plan will be included in the FERC's revised BA and EFH Assessment.
- FA1-25 The phrase "(i.e., 40 years)" has been added to the statement for clarification.
- FA1-26 See section 4.9.4 of the EIS. No traditional cultural properties, including religious or sacred sites important to Indian tribes, have been identified within the area of potential effect. We have not yet completed compliance with the NHPA, and have recommended a condition that would require the completion of cultural resources studies prior to construction being allowed to begin.

- FA1-27 | "government-to-government" consultation with the tribes.
- FA1-28 | • There is a need for additional analysis and proposed mitigation measures for construction of the dock facilities and pipe laying/ground disturbing activities.
- There is a need for additional analysis of how fish and wildlife will be protected from entrainment and/or impingement in the operation of the ships taking on ballast water.

If you have any questions or need assistance in setting up government-to-government meetings, please contact Dr. B.J. Howerton, Northwest Regional Office, Environmental Services at (503) 231-6749.

Sincerely,

Regional Director

FA1-27 Sections 4.5 and 4.6 contain detailed discussions of potential impacts on fish and wildlife associated with the construction of the LNG terminal, including the jetty, and other ground disturbing activities. As discussed in section 2.1.5, NorthernStar's revised Compensatory Mitigation Plan will be included in the FERC's revised BA and EFH Assessment.

FA1-28 All intake screen designs have been reviewed and approved by the NMFS and comply with ODFW and NMFS regulations and fish design criteria.

As is typical for all large cargo vessels, water would be appropriated by LNG carriers during unloading as ballast and to cool the engines generating power for the offloading pumps and other onboard systems. To minimize entrainment and impingement of juvenile fish during ballast and cooling water intake, NorthernStar would construct a system capable of delivering filtered water to the LNG carrier. NorthernStar would offer contract incentives to the LNG suppliers to retrofit LNG carriers to connect with the filtered water supply system. Since issuance of the draft EIS, NorthernStar has stated it may not be feasible to require that all carriers utilize the system. We conducted additional analysis of entrainment by LNG carriers at the wharf without the use of the filtered water supply system and NMFS-approved screens. Due to the potential impacts on sensitive aquatic resources at the terminal, we are recommending in section 4.5.2.1 that NorthernStar develop a plan to deliver screened water to LNG carriers at the terminal. We are also recommending that NorthernStar conduct post-installation tests of all intake screens at the terminal, and develop a monitoring and reporting program to assess the efficacy of the screened water supply system at minimizing entrainment and impingement. We will incorporate NorthernStar's screening plan into our revised BA and EFH Assessment. The NMFS will review our BA and EFH Assessment during formal consultation under section 7 of the ESA, and prepare a BO determining whether or not the federal actions associated with this project would likely jeopardize the continued existence of a listed species, or result in the destruction or adverse modification of designated critical habitat. The FERC will not allow construction to proceed until after we have concluded formal consultation with the NMFS and FWS.

Re: Draft Environmental Impact Statement for the Bradwood Landing Liquefied Natural Gas Terminal and Pipeline Project (Docket No. CP06-365-000, *et al.*)

Dear Ms. Bose:

The National Oceanic and Atmospheric Administration (NOAA) is pleased to provide comments on the Draft Environmental Impact Statement (DEIS) for the Bradwood Landing Liquefied Natural Gas Terminal and Pipeline Project (CP06-365-000, *et al.*), dated August 2007, from the Federal Energy Regulatory Commission (FERC), the lead federal agency. According to the DEIS, Bradwood Landing LLC and NorthernStar LLC are proposing to construct and operate a liquefied natural gas (LNG) import terminal located along the Columbia River at river mile 38. Components of the terminal include: 58-acre ship maneuvering area, ship berth and unloading facilities, two LNG storage tanks, vaporization and vapor handling systems, support facilities, 36.3-mile sendout pipeline, and interconnections to three lateral pipelines. The proposed project would have the capability of mooring LNG transport vessels with cargo capacities ranging from 100,000 to 200,000 m³. Revaporization of the LNG would use a submerged combustion vaporizer.

In May 2007, NOAA's National Marine Fisheries Service (NMFS) provided detailed comments on the proposed project under the Endangered Species Act and Magnuson-Stevens Fishery Conservation and Management Act.¹ Numerous comments in NMFS' May 2007 letter are applicable to the EIS and have not been addressed adequately in the DEIS. FERC should review those comments and incorporate information from subsequent discussions into the Final Environmental Impact Statement (FEIS), as appropriate.

In addition to those previously provided comments, NMFS has enclosed comments specific to the DEIS. The comments are based on NMFS' special expertise and responsibility to manage, conserve, and protect marine and coastal living resources as provided under the Endangered Species Act, the Magnuson-Stevens Fishery Conservation and Management Act, the Marine Mammal Protection Act, and the Fish and Wildlife Coordination Act. In all cases, the comments are relevant, either directly or indirectly, to NMFS' responsibilities under the aforementioned statutes and are consistent with the agency's regulatory obligation to its trust resources. However, FERC should not interpret these comments as satisfying its obligation to consult under the Endangered Species Act or Magnuson-Stevens Fishery Conservation and Management Act.

¹ Letter from Michael Tehan (NMFS) to Lonnie Lister (FERC) regarding a request for additional information related to the Endangered Species Act and Essential Fish Habitat consultations for the Bradwood Landing LNG terminal and pipeline (May 11, 2007).

In licensing and regulatory matters, decisions and judgments are based on the best scientific data available at that time. Where data are abundant, precise requirements may be in order. Where available scientific data are not comprehensive, precision is not always possible, and more projections and judgments are used. While NOAA has certain scientific data relevant to the effects of the operation of the proposed facility on marine and anadromous species and their habitats, they are not necessarily comprehensive on all matters related to the projected effects of the facility operation. In certain areas the available scientific data are quite sparse.

NOAA believes substantial work remains to complete the EIS to ensure the impacts to the environment are described, analyzed, and mitigated adequately. The enclosed comments highlight NMFS' remaining concerns as they pertain to the proposed action's potential for significant effects to the aquatic environment and areas in need of further consideration in the EIS. NOAA recommends FERC not issue the FEIS until the project design and mitigation and adaptive management plans are finalized.

NOAA appreciates the opportunity to comment at this time, and looks forward to continuing to provide FERC with assistance on the subject action. Please direct questions regarding this letter to Robert Markle, fishery biologist, or Bridgette Lohman, natural resource specialist, in the Habitat Conservation Division of NMFS Northwest Region at 503-230-5400.

Sincerely,

Rodney F. Weiher, Ph.D.
NOAA NEPA Coordinator
Office of Program Planning and Integration

Enclosures: DEIS comments

cc: SERVICE LIST

BRADWOOD LANDING LNG
DEIS COMMENTS

The National Marine Fisheries Service (NMFS) offers these comments specific to the Federal Energy Regulatory Commission's (FERC) Draft Environmental Impact Statement (DEIS) for the Bradwood Landing Liquefied Natural Gas (LNG) Terminal and Pipeline Project. These comments are in addition to those comments previously provided (May 11, 2007) on the biological assessment that may also have relevancy to the DEIS. The comments are based on NMFS' special expertise and responsibility to manage, conserve, and protect marine and coastal living resources as provided under the Endangered Species Act (ESA), Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act), Marine Mammal Protection Act (MMPA), and the Fish and Wildlife Coordination Act. In all cases, the comments have relevancy, either directly or indirectly, to NMFS' responsibilities under that legislation, and are consistent with the agency's regulatory obligation to its trust resources.

In certain instances comments include examples that are ancillary to the principal comment. These examples, which do not constitute a comprehensive list, are solely provided to assist FERC in better understanding the intent of the principal comment.

Alternatives Analysis

1. While the proposed Bradwood Landing LNG terminal footprint is smaller than other proposed or existing LNG import terminals, the proposed project still causes a permanent loss and modification of habitat essential for numerous salmonid species listed under the ESA and Magnuson-Stevens Act. Significant project effects include extensive dredging, filling of off-channel aquatic habitat and the 100-year floodplain, modification and chronic disturbance of nearshore habitat, and alteration of riparian and estuarine habitat. The applicant has stated, and the DEIS repeats, that the terminal footprint cannot be further reduced.² Therefore, according to FERC, it appears that environmental impacts on site cannot be further avoided.

Given this conclusion, the current presentation of alternatives in the DEIS does not consistently or equivalently analyze the impact to NMFS' trust species or the Columbia River Estuary. Based on the anticipated environmental effects of the applicant's proposed action, NMFS suggests FERC give serious consideration to reanalysis of alternatives to develop a more environmentally appropriate site considering the following:

- | | |
|-------|---|
| FA2-1 | a) In several instances only Oregon data are presented. As the stated objective is providing the Pacific Northwest with another natural gas source, it would appear additional data from the region is warranted. |
| FA2-2 | b) The duration and magnitude of impacts do not appear to have been fully considered in the alternatives analysis. Impacts that are permanent or chronic should be given significantly |

² Letter from Dave Glessner (Bradwood Landing LLC) to Mitch Rohse (Clatsop County) regarding Bradwood Landing's Clatsop County permit (July 31, 2007).

Federal Agencies

FA2-1 Our analysis in section 3.1 discussed a range of alternatives over a wide geographic region, not just in Oregon. This includes potential LNG import terminals in British Columbia, Canada, northern Mexico, California, Washington, and Oregon; the conversion of existing LNG storage facilities in Idaho, Washington, and Oregon; and new pipeline system alternatives extending from Wyoming to Oregon.

FA2-2 Our EIS does consider the duration and magnitude of the proposed action. We describe impacts as being either temporary or long term. Alternatives that are similar in design to the Bradwood Landing Project, including alternative LNG terminals and pipelines, would have impacts on resources of similar duration. Therefore, none of those alternatives are considered to be environmentally superior to the proposed action. In some cases, where pipeline alternatives are longer than the proposed Bradwood Landing sendout pipeline, the magnitude of impacts for the alternatives would obviously be greater.

FA2-2
cont'd

greater weight than temporary or short-term impacts. For example, in most instances when appropriate conservation measures are successfully implemented (*e.g.*, HDD stream crossings), the impact of pipeline construction on aquatic systems can be avoided or be limited to temporary or short-term duration. In such instances the transitory nature of the impact likely limits the magnitude of the environmental effect. Conversely, impacts that are permanent (*e.g.*, aquatic and wetland filling, sequestration of dredged sediment) or chronic (*e.g.*, maintenance dredging, wake stranding of juvenile salmonids) are of considerable environmental concern and are more likely to have significant impacts on sensitive species. FERC needs to consider the duration and magnitude of likely impacts when determining whether environmental advantages exist between alternatives.

FA2-3

c) The sensitivity of a species or their habitat to change does not appear to have been factored into the alternatives analysis. An alternative that impacts only viable fish populations is preferable to one that impacts at-risk species. Similarly, an alternative that impacts few or no ESA-listed species is preferable to an alternative that impacts many ESA-listed species. FERC should analyze how, for example, endangered, threatened or sensitive species and their associated habitat could be impacted by each of the proposed alternatives. Moreover, NMFS believes that all of the alternatives should include measures to minimize and/or avoid impacts to threatened and endangered species and their critical habitat. This is consistent with the implementing regulations for NEPA, which state that both context and intensity must be considered when determining significance, and that the ESA-status of a species and their critical habitat are one consideration (40 CFR 1508.27). FERC needs to consider environmental impacts in terms of species and habitat sensitivity when evaluating project alternatives.

FA2-4

d) The DEIS indicates rough sea and weather conditions off the coast of the Pacific Northwest preclude the siting of offshore terminals. To those not readily familiar with the circumstances that differentiate proposed or existing terminals or other similar structures located in harsh environmental conditions elsewhere (*e.g.*, Calypso LNG terminal off the eastern coast of Florida, Troll Natural Gas Fields in the North Sea with depths of 1,100 feet), FERC should explain further why the placement of terminals offshore of Washington and Oregon are not feasible.

FA2-5

e) It remains unclear what weight FERC gives to financial costs. In multiple instances FERC appears to dismiss alternatives due to financial considerations without fully evaluating environmental or public safety impacts. FERC should develop and implement a more transparent cost/benefit decision matrix in the alternatives analysis. Furthermore, any financial costs analysis should be comprehensive and include costs associated with each alternative in its entirety (*e.g.*, increased shipping costs to river commerce due to traffic restrictions, impacts to fisheries, increased emergency response capacity).

FA2-6

f) It remains unclear what role site or capacity expansion plays in consideration of suitable alternatives to the proposed project. Section 3.1.6.2 discusses terminal expansion in terms of the proposed Bradwood Landing LNG terminal, but appears not to do the same for the alternatives. If expansion potential is a decision element, FERC should modify its selection criteria to clarify the weight given to expansion in the alternatives analysis.

Federal Agencies

2

FA2-3

Our alternatives analysis was limited because a detailed analysis of most of the alternative sites is not feasible. We looked at factors that we were able to obtain data for and objectively compare among the sites. We did not identify any alternatives that would have significantly less impact on at-risk species. For example, based on currently available information, there is the potential for the Oregon LNG Project to impact federally listed threatened and endangered salmon species in the lower Columbia River estuary, and the sendout pipeline for the Jordan Cove LNG Project would cross old growth forest habitat occupied by marbled murrelet and northern spotted owl. All the LNG terminal alternatives would have to include similar measures to avoid or minimize impacts on federally-listed threatened and endangered species for the FERC to consider under the ESA.

FA2-4

We have revised section 3.1.4 of the EIS to better explain why the placement of an LNG terminal off the coast of Oregon or Washington would not be preferable to onshore locations. According to a report produced by ABSC (2006), LNG Receiving Terminal Offshore Oregon as an Alternative to the Land Based Bradwood Facility, which we summarize in the EIS, the seas offshore in the Pacific Northwest are significantly rougher than seas off the Gulf or Northeast coasts. Therefore, it is not feasible to develop an offshore terminal as an alternative to the Bradwood Landing Project, given the rough sea conditions in the ocean off the Oregon coast, and technologies that may be used for an offshore terminal.

FA2-5

Costs were used as one factor in comparing offshore alternatives to the proposed project. We also used economic feasibility in a qualitative sense when comparing the proposed site to other alternatives. However, not enough information is available at a sufficient level of detail for all sites to develop a quantitative comparison of the site alternatives based on costs.

FA2-6

Section 3.1.6.2 discusses alternative site layouts for the proposed LNG terminal, based on criteria NorthernStar indicated were necessary for the operation of its facility, including space for future expansion. However, we did not use the ability to expand as a critical factor in our consideration of alternatives. We disagree that this element should be a factor in evaluating alternative LNG terminal sites.

FA2-6 | Furthermore, if expansion potential is not a siting consideration, there appears no reason that reserving space for a third tank at Bradwood Landing should be considered necessary to the proposed project and the facility footprint should be reduced accordingly.

FA2-7 | g) FERC should clarify the project purpose. Is the purpose to provide a new source of LNG to the Pacific Northwest? Is the purpose to provide a new source of LNG for Wauna Mill, NW Natural, PGE, and Williams Pipeline? The pipeline alternatives analysis would appear to indicate the latter is true, which greatly constrains the alternatives that meet the project purpose and appears to increase the environmental impacts of other alternatives as they try to service the same potential customers.

Proposed Action and Environmental Impacts

FA2-8 | 2. The DEIS indicates the area of analysis related to LNG vessel traffic extends from the territorial seas boundary, 12 nautical miles from shore, up the Columbia River to the proposed LNG terminal site at river mile 38. NMFS is unclear why the analysis area does not extend out to the 200 nautical mile boundary of the Exclusive Economic Zone, which is the area analyzed in the ESA and Essential Fish Habitat assessments. The analysis area should be expanded out to the Exclusive Economic Zone boundary in the Final Environmental Impact Statement (FEIS), or the FEIS should explain why there is a discrepancy between the EIS and the biological assessment.

FA2-9 | 3. The applicant's proposed action has changed significantly since the DEIS was issued and aspects of the proposed action remain poorly defined. Consequently, the environmental analysis lacks accuracy and the needed level of detail. Improvements to Clifton Road, delineation of offshore vessel routes, stream crossing methodology for the pipeline, proposed mitigation, and the waterbody mitigation plan are some of the project aspects that have been modified and are not analyzed or inadequately analyzed. For actions that appear to remain the same as originally proposed, many are poorly defined (*e.g.*, lack of 60 percent or greater engineered design plans for fish screens at water withdrawals including ballast water/engine cooling water plans, ability to dispose of dredge material at the proposed Wahkiakum County Sand Pit without necessary permits). The change in proposed action or lack of specificity causes the impacts analysis to remain inadequate (*e.g.*, juvenile salmonid wake stranding analysis, shoreline erosion from vessel transits, terminal lighting impacts, vegetation management at the terminal, noise from pile driving activities).

FA2-10 | 4. The mitigation plan included in the DEIS appears inadequate and incomplete. The preferred alternative³ does not contain any mitigation for several adverse impacts on NMFS' trust resources, including listed species under the ESA. Sediment sequestration and wake stranding of juvenile salmonids are areas of particular concern. Where mitigation is proposed at Svensen Island, the description of the action has changed and is inadequate for assessment of beneficial effects to NMFS' trust resources that are impacted by the proposed project. For example, not all of the island is currently within the applicant's ownership or subject to the applicant's right to make modifications. Thus, FERC should not issue the

³ NorthernStar's proposed action, as modified by the FERC's recommended mitigation measures, is the preferred alternative.

Federal Agencies

2

FA2-7 | As indicated in sections 1.1 and 3.1, the primary objective of the Bradwood Landing Project is to provide a new source of natural gas to the Pacific Northwest through the importation of LNG. In order to accomplish that objective, NorthernStar would need to interconnect with the existing Williams Northwest jurisdictional interstate system, and the existing system of Northwest Natural, which is the nonjurisdictional LDC for northern Oregon and southern Washington. Related to that objective would be the ability to directly serve industrial customers in the Pacific Northwest, such as the Georgia-Pacific paper mill at Wauna, Oregon and the PGE Beaver Power Plant at Port Westward, Oregon,

FA2-8 | The geographic scope of the EIS was established to coincide with the regulatory jurisdiction of the FERC and cooperating agencies (*i.e.*, COE, and Coast Guard).

FA2-9 | We disagree that the proposed action has changed significantly since the draft EIS. Certain engineering details have been revised and plans have become more detailed based on continued consultations by NorthernStar with various agencies and further refinement of engineering plans. We have updated the final EIS as appropriate based on new information and based on comments received on the draft EIS. Our revised BA and EFH Assessment will continue to reflect any new updates and will contain a complete impacts analysis.

FA2-10 | Since the issuance of the draft EIS for the Bradwood Landing Project, numerous discussions have occurred between the FERC, NMFS, FWS, and NorthernStar regarding the Compensatory Mitigation Plan as it relates to the BA and EFH Assessment. As a result of these discussions, NorthernStar is currently revising its Compensatory Mitigation Plan. The revised Compensatory Mitigation Plan will be filed with the FERC upon completion and will be included in the FERC's revised BA and EFH Assessment. Section 2.1.5 has been revised to reflect this information.

As described in section 4.4.1.2, because NorthernStar's Compensatory Mitigation Plan has not been finalized, we have recommended that NorthernStar continue to consult with the COE, FWS, NMFS, ODFW, ODSL, WDE, and other appropriate resource agencies to finalize its Compensatory Mitigation Plan. The FERC would not issue a Notice to Proceed to NorthernStar until the final Compensatory Mitigation Plan, along with agency comments and appropriate approvals, has been filed with the Secretary. Directions for accessing NorthernStar's Compensatory Mitigation Plan via the eLibrary can be found in the response to comment PM6-11.

FA2-10
cont'd

FEIS until the applicant's ability to secure the necessary interests in land have been clearly articulated in the proposed mitigation plan. In addition, FERC needs to clearly articulate how the benefits provided at Svensen Island for salmonids adequately compensate for the decrease in habitat and habitat quality 14 river miles upstream and for on-going operational impacts that affect the viability of the affected populations. Furthermore, because the terminal would be operated for 40 years, a monitoring and adaptive management plan needs to be developed by the applicant, in consultation with NMFS that assures continued benefit to the target species over the lifetime of the project, and beyond if the affected habitat is not restored.

FA2-11

5. The DEIS states hydrodynamic modeling indicated minor changes would likely result from the proposed project, but it does not appear to evaluate the model results in terms of a long time horizon or impacts other than those originally identified. For example:
- a) Modeling indicated that NMFS' original concerns of Clifton Channel becoming the primary channel are unlikely to occur. However, the DEIS does not evaluate whether the "minor" increase in sediment deposition in the channel would accumulate over the long term (*e.g.*, ≥ 100 years); nor whether such deposition would appreciably reduce flow in Clifton Channel and alter the channel's biological function and value.
 - b) Modeling indicated that bed elevation changes north of the Lewis and Clark National Wildlife Refuge near the main navigation channel would be minor (0.05 to -0.05 feet) after 90 days of 50 percent exceedance discharge, but "the change would be more pronounced within the Columbia River near the navigation channel." FERC should clarify the spatial and temporal considerations of these statements.

FA2-12

6. The applicant submitted differing proposed actions to the local, state, and federal permitting agencies with regards to whether two or three tanks would be built. The DEIS states that the applicant has not committed to expanding the terminal, however if they wish to expand by way of a third tank, the terminal layout accounts for this. It remains unclear how storage capacity factors into the project's purpose and need, in addition to FERC's alternatives analysis as previously discussed. The applicant's own statements have indicated that storage capacity does not determine throughput (sendout) capacity.⁴ Therefore, the need to accommodate and reserve space for a future third tank appears questionable since the terminal is already designed to accommodate a peak sendout capacity of 1.3 billion cubic feet per day (Bcfd). As such, the subject of whether the project footprint has been minimized to the greatest degree practicable remains in question. The FEIS should clarify this topic and provide supporting rationale on how the project footprint has been minimized, perhaps through modeling various operating scenarios.

FA2-13

7. The factors that influence the volume of LNG vessel traffic remain unclear. Originally, during conversations with the applicant, it was stated that the addition of a third tank on site would likely correspond with an approximate 50 percent increase in LNG vessel traffic. More recently, the applicant has linked LNG vessel traffic to an average 40 percent operating

⁴ Letter from Dave Glessner (Bradwood Landing LLC) to Mitch Rohse (Clatsop County) regarding Bradwood Landing's Clatsop County permit (July 31, 2007).

Federal Agencies

2

FA2-11

After the lifetime of the project, the maneuvering basin would be expected to fill in and downstream areas gradually return to general pre-project conditions over the long-term. Additional details regarding the hydrodynamic modeling can be found in Hydrodynamic and Sediment Transport Assessment, Bradwood Landing Liquefied Natural Gas Import Terminal Project by West Consultants, Inc. 2006, available on the FERC's eLibrary. This document is available for viewing by the public on the FERC's internet web page at www.ferc.gov, through the eLibrary link, selecting "General Search," entering the docket number minus the last three digits (*i.e.*, CP06-365), and putting in the proper date range. As discussed in section 4.5.2.1, impacts on aquatic resources attributed to sediment transport and deposition may occur as a result of the proposed project. Additional analysis of potential impacts on salmonids from alterations of sediment transport and deposition will be included in the revised BA and EFH assessment.

FA2-12

See our response to PM1-27. Space for the third tank would be needed if the facility were to expand its sendout capacity beyond the currently proposed 1.3 Bcfd. We believe our discussion regarding minimization of the facility footprint is sufficient and modeling of various operating scenarios is not warranted.

FA2-13

The maximum number of annual LNG carrier trips proposed for the project is 125.

FA2-13
cont'd

capacity and throughput (sendout) capacity.⁵ First, an average has little meaning without identifying the range and period of measure. More importantly, limiting the volume of LNG delivered to the terminal and the amount of natural gas sent out from the terminal based on a 40 percent operating capacity seems unreasonable and contrary to the economic principles of a free market economy, which seek to maximize investor profits. Moreover, the proposed connection of the Palomar Pipeline to the Bradwood Landing LNG terminal would increase the terminal's sendout potential and is likely to result in an increase in sendout capacity. Therefore, it appears reasonable that LNG vessel traffic associated with the proposed terminal would increase above the 125 vessels per year stated in the DEIS. This fact should be accounted for in the FEIS.

FA2-14

8. In a related matter, FERC should clarify whether any increase in sendout or throughput capacity at any future point during terminal operations would likely require a corresponding increase in vaporizers and discharge of condensate. The DEIS indicates the terminal's nominal sendout rate is 1.0 Bcfd, and that the pipeline and vaporizers are sized to accommodate a peak sendout rate of 1.5 Bcfd and 1.3 Bcfd, respectively. The applicant has indicated that the existing proposed terminal footprint cannot be further reduced because all areas within the terminal are required for current operations.⁶ Given that comment, the FEIS needs to discuss where additional vaporizers would be accommodated on site to provide for an increase in the nominal or peak sendout rate above what is currently proposed and whether there are any environmental impacts associated with such an expansion.

FA2-15

9. FERC's Notice of Intent for the Palomar Pipeline project (PF07-13) indicates the proposed pipeline would terminate at NorthernStar Energy LLC's Bradwood Landing pipeline near Wauna, Oregon. But for the construction of the Bradwood Landing LNG import terminal, the Palomar project apparently would not be constructed as proposed (see DEIS 2.1.6). At a minimum, segment 2 of the Palomar project would appear interdependent on the Bradwood Landing LNG project. The 50 CFR 402.02, regulations which implement the ESA, define interrelated and interdependent effects. Interrelated actions are those that are "part of a larger action and depend on the larger action for their justification." Interdependent actions are those that "have no independent utility apart from the action under consideration." Segment 1 would achieve connection to NW Natural's regional distribution system and provide another natural gas source to the Portland Metro area. Extension of the pipeline to Bradwood Landing would have no utility independent of the proposed action. Extension of a bi-directional pipeline to the Mist Storage Facility would provide indirect access to Bradwood Landing LNG via a proposed lateral pipeline from NorthernStar's pipeline to Mist. Implementation of segment 2 fundamentally alters the Palomar Pipeline's operations from a LNG source for the Portland Metro area to a West Coast distribution network for Bradwood Landing LNG. FERC should include anticipated impacts of segment 2 of the Palomar Pipeline project in the FEIS.

10. FERC has attempted to address inadequacies in the applicant's proposed action and impact analysis by recommending in the DEIS that certain actions be taken by the applicant prior to various steps in the authorization or construction process. In several instances NMFS

⁵ *Ibid.*

⁶ *Ibid.*

Federal Agencies

2

FA2-14

Any future expansion of the Bradwood Landing LNG terminal would require a separate authorization from the FERC along with the associated environmental review required under the NEPA. Any plans for future expansion are speculative. We are not considering the environmental impacts of a future expansion in this EIS.

FA2-15

We disagree that the Palomar pipeline is an interrelated action of the Bradwood Landing Project. The segment of the Palomar pipeline that would go to the Bradwood Landing LNG terminal is a small part of the project and its environmental impacts are being evaluated under the EIS for the Palomar pipeline. Furthermore, as described in comment letter CO4 by Northwest Natural, it is not possible for a new pipeline to directly connect to the Mist storage field. Our discussion of the Palomar pipeline has been revised in section 3.1.2.2.

believes these recommendations address critical information that must be provided before FERC's environmental impact analysis can be finalized and in some instances does not require the appropriate information. For example:

- FA2-16 a) The DEIS indicates that the applicant should continue to consult with the state and federal agencies to finalize the compensatory mitigation plan before beginning construction. NMFS views project mitigation as part of the applicant's proposed action. Consequently the impacts (beneficial and detrimental) of mitigation need to be analyzed in the EIS along with the impacts of other aspects of the proposed action. The FEIS should not be issued until the mitigation plan is complete.
- FA2-17 b) The DEIS indicates that the applicant should continue to develop a waterbody mitigation plan and that "the plan, including agency comments on the plan, should be filed with FERC for review and written approval by the Director of OEP [Office of Energy Projects] prior to the end of the draft EIS comment period." While NMFS has discussed this plan (in part) with the applicant during the DEIS comment period,⁷ NMFS is unaware of any coordination with other state and federal agencies on this topic. The applicant should present a final plan to the reviewing agencies and request written comment following adequate time for agency review before FERC issues the FEIS.
- FA2-18 c) The DEIS notes that the proposed terminal site may contain contaminated soils and recommends the applicant prepare a contaminated materials management plan (CMMP) prior to construction. While NMFS supports the development of a CMMP, FERC should also require a contaminant detection plan be developed and implemented prior to the FEIS to provide more definitive information about site contamination and allow FERC to evaluate the contaminant risk of project implementation. For example, would driving micro-piles for the LNG storage tank foundations result in soil contamination from puncturing a subsurface oil tank, or would vibro-floatation and increasing the overburden on site facilitate migration of existing soil contaminants to surface waters?
- FA2-19 d) The DEIS indicates that wake stranding of small fish is likely to result from LNG vessels transiting the lower Columbia River to Bradwood Landing and that FERC will provide additional analysis in the revised biological assessment. NMFS appreciates that FERC recognizes the DEIS analysis for this topic is inadequate and needs to be thoroughly assessed before formal consultation can be initiated. NMFS assumes FERC similarly recognizes the importance of including such impacts associated with the proposed project in the FEIS environmental and alternatives analyses.
- FA2-20 11. Under section 1.3.5 the DEIS neglects to acknowledge FERC and the other action agencies' ESA responsibilities and provides an overly narrow characterization of the U.S. Fish and Wildlife Service and NMFS' responsibility. NMFS suggests the following revisions: 1) Cite section 7(a)(1) of the Endangered Species Act to clarify the action agencies' responsibilities, and 2) revise text to read "...authorizing the Bradwood Landing Project may jeopardize the continued existence of or result in the destruction or adverse modification of designated critical habitat for any ESA-listed species" to clarify the purpose of the biological opinion.

⁷ The Waterbody Mitigation Plan was discussed during the November 5, 2007, conference call with NorthernStar and FERC, but the meeting time expired before NMFS could provide all its comments.

Federal Agencies

2

- FA2-16 See our response to comment FA2-10. NorthernStar's Compensatory Mitigation Plan was not finalized in sufficient time for inclusion in this document. We believe the impacts from the mitigation plan will receive appropriate review through the recommended consultation process with federal and state resource agencies and through the course of the ESA formal consultation process. The NMFS request that the final EIS not be issued until the mitigation plan is complete is inconsistent with our statutory mandate of expeditious completion of FERC LNG project review.
- FA2-17 NorthernStar filed its Waterbody and Wetland Construction and Mitigation Procedures Plan with the FERC on December 21, 2007. This document is available for viewing by the public on the FERC's internet web page at www.ferc.gov, through the eLibrary link, selecting "General Search," entering the docket number minus the last three digits (i.e. CP06-365), and putting in the proper date range. However, the plan is currently being revised by NorthernStar based on discussions with the NMFS related to the BA and EFH Assessment for the project. Therefore, we have recommended in section 4.3.2.4 that NorthernStar continue to consult with the COE, NMFS, FWS, and other appropriate federal and state agencies to finalize its Waterbody and Wetland Construction and Mitigation Procedures Plan.
- FA2-18 Based on discussions between NMFS, the FERC, and NorthernStar related to the BA and EFH assessment, it is our understanding that NorthernStar is pursuing this issue further.
- FA2-19 Section 4.5.2.1 has been modified to include data from Entrix (2008), which used a process model approach for the Port of Vancouver in a wake stranding analysis to describe physical characteristics related to wake stranding such as bathymetry, LNG carrier size, carrier distance to shore, beach slope, and berm characteristics.
- According to the CEQ Guidelines for the preparation of an EIS, the level of effort in addressing potential impacts from project activities should be commensurate with the expected level of impact. Because the best available science does not currently provide a guideline for determining the number of fish which could be impacted, we believe that by recognizing LNG carriers transiting the lower Columbia River over the operation life of the LNG terminal are likely to result in the stranding of some sub-yearling fish, we have met this requirement.
- Further analysis and discussion of possible impacts on salmonids due to wake stranding will be in the revised BA and EFH Assessment.
- FA2-20 Section 1.3.5 of the final EIS has been modified in response to this comment.

- FA2-21** 12. The DEIS indicates the U.S. Coast Guard's issuance of a Letter of Recommendation would be based, in part, on the environmental impacts of LNG vessels transiting from open water to the terminal facility. NMFS believes these should include wake stranding of juvenile salmonids, bank erosion, introduction of invasive species through hull fouling, effective minimization of entrainment of juvenile salmonids from ballast water uptake, and impacts to water temperature from the discharge of engine cooling water. NMFS has repeatedly requested information on these potential impacts. This information is needed to allow an informed analysis of impacts to be completed for the preferred alternative. All analyses of this information should be included in the FEIS.

Coordination with natural resource agencies

- FA2-22** 13. In general, while the applicant and FERC have met regularly with NMFS since late August regarding NMFS' additional information letter for the biological assessment (May 11, 2007), coordination with state and federal natural resource agencies has been inconsistent and infrequent. This failure to utilize local expertise on such matters as fish distribution and stream habitat characteristics constitutes a failure to use the best available information in determining the environmental impacts of the preferred alternative. Since several aspects of the applicant's proposed action remain in development (*e.g.*, pipeline stream crossings, mitigation), better coordination with the resource agencies is needed before the FEIS is issued. Where coordination has occurred with NMFS, NMFS expects that the FEIS will reflect those discussions.
- FA2-23** 14. Section 2.8.2.2 indicates an emergency response plan (ERP) would be developed to address procedures to follow in the event of an emergency along the pipeline and section 4.12.5 states "... NorthernStar has agreed to develop, maintain, and continually improve an ERP in consultation with the U.S. Coast Guard and state and local agencies." Where implementation would not increase risk to life and property, the ERP should include response measures to minimize environmental impacts. These measures should be developed in consultation with NOAA staff³ and be incorporated prior to operation of the terminal.
- FA2-24** 15. In the Conclusions and Recommendations section, a statement indicates that "construction should not be allowed until after FERC has completed formal consultations under the ESA." This statement warrants clarification. NMFS expects consultation to be completed before FERC signs the record of decision for the preferred alternative. If this is not FERC's understanding of the Federal action under consultation, the agencies need to discuss this subject.

Fisheries

16. The EIS needs to more clearly describe how safety and security zones would impact traditional recreational and commercial fisheries in the project area. For example:

³ NOAA has specialized staff experienced in spill response and damage assessment.

Federal Agencies

2

- FA2-21** Wake stranding is discussed in the response to comment FA2-19.

Section 4.5.1.1 has been revised to include additional information on shoreline erosion. Further analysis will be included in the revised BA and EFH Assessment.

Section 4.5.1.1 has been revised to include additional information on the potential for introduction of aquatic species to the lower Columbia River system.

Minimization measures to prevent entrainment of juvenile salmonids are discussed in the response to comment FA1-28.

- FA2-22** We disagree that the final EIS should not be issued before completion of the coordination process. We have had frequent consultations with federal and state natural resource agencies. Section 1.4 documents agency consultations. As shown in table 1.4-1, FERC staff met with various representatives of Oregon state natural resources agencies on 11 occasions between March 2005 and December 2006. In addition, Oregon state natural resource agencies have filed numerous comments in the record of this proceeding. We believe that there are ample requirements in place with the proposed mitigation measures and our additional recommended certificate conditions to ensure that all recovery coordination efforts are carried out to the satisfaction of all regulatory and designated advisory agencies prior to construction and/or operation of the facility if the Commission approves the project.

- FA2-23** See our response to comment PM1-1.

- FA2-24** See our responses to comments PM3-46 and PM6-94. The FERC intends to revise its BA after the final EIS is issued. We have recommended that the Commission Order include a condition that construction cannot begin until we have concluded formal consultations with the FWS and NMFS, and complied with section 7 of the ESA.

FA2-25 a) During the Buoy 10 fishing season (August-December) would fishers be required to modify their actions to honor safety and security zones? Previously, the applicant has stated it would limit inbound LNG vessel traffic to after-dark hours to reduce impact on the fishery, but the DEIS appears not to mention this measure.

FA2-26 b) Would ingress and egress of fishers from Clifton Channel be prevented or controlled due to the 200-yard fixed security zone at the terminal while the LNG vessel is moored? A figure illustrating the 200-yard security zone on a bathometric chart would aid in illustrating whether access issues exist.

Marine Mammal Protection Act

FA2-27a 17. FERC, through the DEIS, recommends that the applicant obtain an Incidental Harassment Authorization (IHA) from NMFS under the MMPA due to impacts on pinnipeds from terminal construction activities. In order to issue an IHA, NMFS will need to ensure that its NEPA responsibilities are met. NMFS may develop its own NEPA document or it may adopt another federal agency's NEPA analysis or portion thereof provided that the statement or portion thereof meets the standards for an adequate statement (40 C.F.R. 1506.3(a); see generally, section 1506.3 for the adoption process). In this particular case, it would appear that NMFS could, if and when it begins the MMPA process, rely on the FERC EIS if the document adequately: 1) Addressed NMFS' concerns with respect to marine mammals, 2) considered the scope of the MMPA process, and 3) addressed potential mitigation and monitoring measures. To facilitate the MMPA permitting process, should it be needed, NMFS recommends the FEIS provide a robust analysis related to the impacts on marine mammals and incorporate, to the extent possible, the information addressed in NMFS' regulations for IHA applications (50 C.F.R. § 216.104). FERC is encouraged to coordinate closely with NMFS on this matter prior to issuance of the FEIS. The following recommendations apply:

FA2-27b a) NMFS expects that the FEIS will reflect discussions between the agencies on the topic of marine mammals. Particularly, those topics raised during the September 25, 2007, conference call on marine mammals, which included delineation of the action area, acceptable methodologies for predicting the occurrence of marine mammal vessel strikes, and the impact of construction noise on pinnipeds.⁹

FA2-28 b) NMFS recommends FERC and applicant work with NMFS to develop a marine mammal monitoring plan that will satisfy NMFS' IHA needs. In part, the monitoring plan needs to address the qualifications of marine mammal observers, acceptable sighting conditions, and start-up and shut-down procedures. Note that interrupting pile driving to reduce marine mammal harassment may not be desirable for minimizing impacts to ESA-listed salmonids (e.g., increased exposure due to more total strikes).

FA2-29 c) NMFS recommends marine mammal avoidance measures associated with vessel operation be made a requirement.

⁹ Refer to notes of conference call at www.ferc.gov. Search docket number CP-06-365 for "Issuance 20071022-0138" filed October 18, 2007.

Federal Agencies

2

FA2-25 The LNG ship traffic is expected to have impacts similar to other ship traffic relative to recreational and commercial fishing. The safety/security zone is an area to establish Coast Guard authority and should not be viewed as an area of exclusion. As such, restricting LNG ship transit to nighttime hours would not be necessary to reduce impacts during the Buoy 10 fishing season.

FA2-26 The 200-yard security zone at the LNG terminal while LNG ships are unloading would not block access to Clifton Channel for fishing. We have added a new figure to the EIS (see figure 4.8.1-7) that depicts the extent of the security zone at the LNG terminal.

FA2-27a Section 4.6.2 has been revised to include the additional information that has been developed through continuing coordination with the NMFS and NorthernStar relating to marine mammals. NorthernStar submitted additional information with the FERC relating to potential impacts on marine mammals on April 17, 2007. However, this information was not submitted at a date that allowed sufficient time for independent verification by FERC staff prior to inclusion in this document. Therefore, the final EIS does not contain the information addressed in the NMFS's regulations for IHA applications (50 CFR 216.104) and it will be generated as part of a separate NEPA process.

FA2-27b Sections 4.6.2.1 and 4.6.2.2 have been revised to reflect the September 25, 2007 conference call between the FERC and its third-party contractor, Coast Guard, NMFS, and NorthernStar.

FA2-28 NorthernStar has stated that it will consult with the NMFS and apply for an Incidental Harassment Authorization under the Marine Mammal Protection Act. We believe that the development of a mammal monitoring plan would be included as a requirement of the IHA application.

FA2-29 A recommendation has been added to section 4.6.2.1 that NorthernStar coordinate with the NMFS to determine appropriate speed and seasonal restrictions, or other applicable measures, to avoid or minimize impacts on whales.

Cumulative Impacts

FA2-30 18. As with several aspects of the DEIS, the Cumulative Impacts section makes poorly supported or unsupported statements and conclusions. For example, section 4.12.5 states that the “impacts on shipping associated with the safety and security zones for the LNG vessels would increase; however, these impacts would still be relatively minor.” First, this statement is in need of greater consideration and supporting information, particularly in terms of the other actions listed that would further increase vessel traffic in the affected waterway. Since this section addresses socioeconomic factors it would seem that a more robust economic assessment is warranted in the FEIS. Furthermore, to what does “relatively” refer and to what degree is this the appropriate approach to analyze the impacts of the preferred alternative and the action(s) identified in Table 4.12-1? The “historic” vessel traffic volume is not the appropriate context and does not provide any biological evaluation of impacts.

FA2-31 19. The cumulative impacts analysis on aquatic resources (*i.e.*, anadromous fish) is a single paragraph. This seems overly abbreviated. In the FEIS, FERC should include a more robust analysis that includes, for example, the cumulative impacts of increases in vessel traffic on wake stranding of juvenile salmonids, introduction of invasive species from hull fouling and ballast water discharge, and entrainment and impingement of biota by ballast/cooling water withdrawals.

General Comments

FA2-32 20. The proposed pipeline would terminate at the existing Williams Northwest Pipeline near Ostrander, Washington. NMFS did not note anywhere in the DEIS whether the Williams Northwest Pipeline Corporation has indicated they have available capacity to accommodate natural gas from the proposed NorthernStar pipeline without any modifications to their infrastructure. The FEIS should clearly address this topic, and consider any necessary modification to the Williams Northwest Pipeline in the Interrelated Activities section.

FA2-33 21. The status of government-to-government consultations or staff-to-staff discussions with potentially affected Tribes is unclear. NMFS is required to meet with the potentially affected tribes in the course of ESA section 7 consultation and the development of the biological opinion. A clear description in the FEIS of such consultations and meetings would assist NMFS in meeting its obligations to the tribes. NMFS is prepared to participate in such meetings to the degree the agency and tribes agree, and is appropriate.

FA2-34 22. NMFS recommends the applicant be required to hold a bond to ensure habitat impacts are fully restored or mitigated in the event of bankruptcy or abandonment. The NMFS wants assurance that in the event the applicant is unable or unwilling to complete the project as proposed, including full implementation of the mitigation plan in perpetuity, that the habitat lost at the terminal site would be restored (and enhanced to account for temporal inequity) or that mitigation would be fully implemented. Both restoration and mitigation would require significant funds to implement. A bond would ensure that the applicant would not walk

Federal Agencies

2

FA2-30 We have revised section 4.12.5 relating to River Traffic, clarifying that even if both the Bradwood Landing and Oregon LNG were authorized, built, and operated, combined LNG carrier traffic in the waterway would only represent an increase of about 14 percent above current levels of commercial ship traffic, but would still not approach historic highs in past commercial ship traffic on the Columbia River.

FA2-31 There would be a very low likelihood that this project, combined with other LNG projects, would introduce invasive species from ballast water discharges because LNG carriers would not discharge ballast water in the waterway or at berth at the proposed terminals. There may be impacts on aquatic species resulting from ballast water intake, and we discuss NorthernStar's approach to this issue in section 4.5.2.1 of this EIS. We discuss the potential for wake stranding in section 4.5.1.1. Section 4.12.3 discusses cumulative impacts on aquatic species.

FA2-32 Section 1.0 has been revised to include a discussion of the Williams Northwest pipeline capacity to accommodate the natural gas from the Bradwood Landing pipeline without modifications to its infrastructure.

FA2-33 The status of government-to-government consultations between the FERC and appropriate Indian tribes is provided in section 4.9.3. See our response to comment FA1-1.

FA2-34 It is not FERC's practice to require posting of performance bonds as conditions in the EIS process. However, other regulatory bodies at the federal, state, and local levels could, if deemed necessary and appropriate, include performance bonds as conditions to their permits. NorthernStar has committed to Clatsop County that it would provide financial assurances in the form of a surety bond or letter of credit for an amount appropriate to cover the reasonable costs of decommissioning the facility.

Federal Agencies

2

FA2-34 | away and leave the affected biota to continue to bear the burden of unmitigated impacts and
cont'd | the public to potentially bear the financial costs of restoration.

FA2-35 | 23. NMFS recommends the applicant be required to hold a bond to ensure adequate financial
resources are available to address environmental impacts resultant from a catastrophic event.
Large industrial facilities that handle hazardous materials and that operate for long periods of
time have a significant risk of experiencing a catastrophic event (*e.g.*, significant flood, fire,
hazardous material spill, vessel accident, pipeline leak). While FERC indicates the
possibility of a catastrophic event is small, the risk has been judged by FERC sufficiently
possible to warrant developing emergency response plans and the U.S. Coast Guard to
recommend additional emergency response capabilities be implemented. Often responses to
environmental damage are delayed while responsibility and funding are determined. A bond
would ensure that any environmental damage that may result from a catastrophic event due to
FERC's authorization of the proposed terminal and pipeline will be restored/mitigated
without delay.

FA2-35 | See our response to comment FA2-34.

Washington, DC 20426

Docket No. CP06-365-000

Dear Ms. Bose:

The U.S. Environmental Protection Agency (EPA) has reviewed the Draft Environmental Impact Statement (DEIS) for the Bradwood Landing Project (CEQ No. 20070362). Our review has been conducted in accordance with our responsibilities under the National Environmental Policy Act (NEPA) and Section 309 of the Clean Air Act.

The DEIS details the NorthernStar Energy, LLC proposal to construct and operate an LNG import terminal and storage facility, and an associated natural gas sendout pipeline. The facility would be located at the former townsite of Bradwood, Oregon, which is situated at Rivermile 38 on the Columbia River. Specific components of the project include a one berth marine facility capable of handling 125 LNG carrier ships per year; interconnecting facilities including piping, electrical, and control systems; two LNG storage tanks with a capacity of 160,000 cubic meters; vapor handling, re-gasification and sendout systems; utilities and other support systems, associated buildings and enclosures, and a 36-mile-long, 30 to 36-inch-diameter natural gas pipeline extending from the LNG terminal to the interconnection with the Williams Northwest Pipeline system north of Kelso, Washington.

The project would be located in an area of key ecological significance. The Lower Columbia River is a federally designated estuary of national significance under the Clean Water Act's National Estuary Program and the Columbia River was designated in 2006 as one of EPA's Priority Large Aquatic Ecosystems (one of seven in the country). This makes the Columbia River a national priority for addressing watershed health. In this context, EPA has identified concerns with the proposed project related to wetlands impacts and mitigation, impacts to air from diesel emissions, dredging, invasive species, ballast water intake, and horizontal directional drilling. In addition, we raise questions and offer recommendations relative to the DEIS development process. These comments focus on the alternatives analysis and incomplete information about interrelated projects. We have discussed these comments in detail in the enclosed attachment.

Federal Agencies

In light of the concerns raised, we have given a rating of EC-2 (Environmental Concerns, Insufficient Information) to the DEIS. A copy of the rating system used in conducting our review is enclosed for your reference. EPA appreciates the opportunity to submit comments on the DEIS and we commend FERC for adopting an extended comment period on this project. EPA welcomes the chance to continue working with FERC as it completes the final EIS. If I can provide additional explanation of our comments please contact me at 206-553-1601, or Teresa Kubo of my staff at 503-326-2859.

Sincerely,

Christine B. Reichgott, Manager
NEPA Review Unit

**EPA Region 10 Detailed Comments
Bradwood Landing Project
Draft Environmental Impact Statement**

Wetlands

FA3-1 The Bradwood Landing Mitigation Plan (August 1, 2007) indicates that construction of the LNG terminal facilities would result in permanent loss of about 12.8 acres of wetlands, while construction and operation of the pipeline would result in permanent impacts to 25.7 acres of wetland in Oregon (Table 3-1) and .25 acres of forested wetland in Washington (p. 81). In addition, project construction would permanently impact 1.8 acres of aquatic (nearshore and stream) habitat (Table 3-1). It should be noted that the number of wetland acres identified as potentially impacted in Table 3-1 are different from those identified elsewhere in the mitigation plan, and different from those numbers presented in the DEIS. It is not clear why this discrepancy exists, or why the permanent wetland impacts identified in Table 3-1 of the mitigation plan were not considered in the assessment of permanent impacts and compensatory mitigation credits (Table 2-15 of the mitigation plan).

FA3-2 The mitigation plan proposes to compensate for permanent wetland and waterway impacts (tidal and nontidal) by restoring tidal influence to 62 acres of diked pasture wetland on Middle Svensen Island. Due to the discrepancy in acreage totals noted above, EPA is concerned that while this project would add some ecological benefit to the overall system, it may not provide adequate compensation for all of the aquatic resources expected to be adversely affected by this project. If we apply the proposed ratio of three acres of enhancement to mitigate one acre of impact (p. 74 of the mitigation plan) to the acreage totals from Table 3-1, it would appear that a total of 122 acres should be enhanced. This would indicate that proposed mitigation on Middle Svensen Island falls nearly 60 acres short of overall restoration goals. We recommend that this discrepancy be addressed in the final EIS. If restoration goals are not met, we recommend that in-kind mitigation opportunities be explored within the watershed, or alternative off-site restoration or enhancement options be considered.

FA3-3 We recognize that NorthernStar also proposes to protect existing wetlands and habitat on Lower Svensen Island (170 acres) and Hunt Creek (61 acres). However, according to the wetland functional assessment performed on these sites, they are already functioning at a high level for a number of important wetland parameters. Because there is no indication that there are any potential threats to either Lower Svensen Island or the Hunt Creek estuary from additional development or future impairments under current land use restrictions, it is not clear that utilizing protection as a primary means for compensatory mitigation is warranted. While these sites are suitable conservation areas, there is limited restoration or enhancement potential to gain the necessary ecological lift that this project may require.

Air Quality

FA3-4 The DEIS states that emissions from the marine vessels are not expected to have significant air impacts since traffic would be periodic and transient. However, there may be impacts to local air quality that could be reduced with additional mitigation. Ships are anticipated to deliver LNG to the proposed terminal approximately 125 times per year, with each delivery lasting up to 24 hours. Hotelling emissions associated with on-board generators would be continuous during this period. This level of diesel particulate matter release could have adverse local effects. We recommend that the FEIS give additional consideration to the risks

Federal Agencies

3

FA3-1 Permanent wetland impact calculations have been revised in sections 4.4.1.2 and 4.4.1.3.

As described in section 4.4.1.2, because NorthernStar's Compensatory Mitigation Plan has not been finalized, we have recommended that NorthernStar continue to consult with the COE, FWS, NMFS, ODSL, WDE, and other appropriate resource agencies to finalize its Compensatory Mitigation Plan. FERC will not issue the Notice to Proceed to NorthernStar until the final Compensatory Mitigation Plan, along with agency approvals, have been filed with the Secretary. Directions for accessing NorthernStar's Compensatory Mitigation Plan via the eLibrary can be found in the response to comment PM6-11.

FA3-2 See our response to comment FA2-10.

FA3-3 NorthernStar described in its preliminary Mitigation Plan (filed August 3, 2007) that although protection and conservation are documented in regulations as an available tool for compensatory mitigation, this has not been accepted as a form of mitigation to date. Further, NorthernStar stated that the agencies advised not to pursue protection and conservation as a form of mitigation at this time. However, protection and conservation of existing functional high quality aquatic habitat areas is one of the highest recommended management actions (prioritized over habitat restoration) in the NMFS's Interim Regional Recovery Plan, as is the case in most species recovery plans.

Therefore, NorthernStar elected to include the lower Svensen Island and Hunt Creek Mitigation Sites in its Compensatory Mitigation Plan despite the fact that they are currently functioning at a high level for a number of important wetland parameters. NorthernStar indicated in its preliminary Mitigation Plan that despite the reduced compensatory credit it would receive for the lower Svensen Island and Hunt Creek Mitigation Sites, these sites would continue to provide mitigation in the general sense, as agreed to by the ODSL for impacts on "other waters." Directions for accessing NorthernStar's Compensatory Mitigation Plan via the eLibrary can be found in the response to comment PM6-11.

FA3-4 As documented in table 4.10.1.4 in the final EIS, the annual particulate matter estimated to be emitted from the hotelling LNG carriers is approximately 0.5 tons per year. Mitigation measures, such as cold ironing were evaluated and were found to not be technically practicable due to limitations in the electrical distribution grid. In addition, internationally flagged LNG carriers in general are not designed to accept shore power and would have to be specially built or retrofitted to accept it.

The diesel engines used during the construction would comply with all state and federal regulations, including the use of cleaner fuels. Additional measures would be employed such as requesting that idling be limited to short durations.

Federal Agencies

3

FA3-4 posed by diesel particulate matter resulting from the project, and adopt measures to mitigate these emissions. Mitigation measures might include the use of shore-side electrical power (i.e. cold-ironing) for LNG vessels hotelling at the Port, use of cleaner fuels on all diesel engines, installing retrofit devices on all diesel engines, and reducing idling for all diesel engines at the facility during construction or operation.

FA3-5 Also, the emissions inventory for LNG ships, tugs, and security vessels (Table 4.10.1-4) raises a number of questions: (1) It is not clear what the period of record is for the air quality data reported; (2) it is not clear where the air quality measurements were recorded; and (3) it is not clear whether the air quality measurements presented in the table are representative of the conditions along the transit route and the terminal area. In order to demonstrate that the data used in the analysis is current, relevant and representative, we recommend that these questions be addressed in the FEIS.

FA3-6 In addition, we recommend that Table 4.10.1-4 include additional information to clarify potential impacts from SO₂. In particular, it is not clear if the emissions reported are one-way or round trip; and it is not clear whether the table represents the full possible spectrum of SO₂ emissions. According to the table, fuel has an assumed sulfur content of 2.7 weight percent (or approximately 27,000 parts per million - ppm). If fuels at other sulfur contents (lower or higher) are likely to be used, we recommend also including these results. The international sulfur limit for fuel oil used in ships is 45,000 ppm, which can emit large amounts of particle pollution when used.

FA3-7 Finally, we note that LNG contains small amounts of heavier hydrocarbons (propane, ethane and butane) which may need to be removed in order to meet the British Thermal Unit (BTU) and gas quality specifications of receiving entities. We recognize that the Bradwood facility would have systems in place to handle these "boil-off" gasses, but we also note that even though the imported gas may meet local specifications when distributed, the BTU content of that gas may still be greater than the BTU content of natural gas currently utilized throughout Oregon. Natural gas with a higher BTU content and/or higher Wobbe Index has the potential to increase NO_x, carbon monoxide (CO) and unburned hydrocarbon emissions. We therefore recommend that the FEIS include a discussion of the current BTU content normally found in Oregon's natural gas supply, and existing specifications. We also recommend that the FEIS discuss the potential impacts of increasing the BTU content of the gas supply, and address the applicant's commitment to provide a supply of natural gas within a specific quality range.

Dredging

FA3-8 NorthernStar proposes to pump up to about 350,000 cubic yards of dredged material to an existing upland settling basin at the Wahkiakum County Sand Pit site during construction. Dredge spoils from maintenance dredging (estimated at 80,000 cubic yards every two to four years) would also be placed at this site. Once drained, the sand would be moved from the settling basin and distributed by earthmoving equipment along the shoreline. As noted on page 3-57, the shoreline in this area is subject to a combination of ship wakes, wind, and tidal effects that are currently eroding sand from the river beach at a rapid rate. EPA is, therefore, concerned that these conditions may increase suspended sediments and turbidity in the vicinity of the dredged material placement site. The DEIS makes the assumption that because the dredged sediments would be of coarse grain size, the materials would rapidly settle out of the water (p. 4-71). However, the DEIS does not include a modeling run to verify this conclusion nor a monitoring

FA3-5 Table 4.10.1-4 documenting the emissions inventory for the marine vessels supporting the project has been updated and included in the final EIS. The emissions presented in the table represent total emissions from vessels (round trip) for 125 LNG carriers per year. It shows the annual emissions from the mouth of the Columbia River to the proposed terminal location and includes the emissions during LNG carrier transit as well as LNG offloading.

FA3-6 Emissions of SO₂ from the LNG carriers shown in table 4.10.1-4 have been updated to reflect a fuel sulfur content of 4.5 weight percent, the international sulfur limit, for ship main engines and generators in transit. In addition, clarifying information documenting the basis for the emissions estimates has been added to table 4.10.1-4.

FA3-7 The end use of the natural gas that would be transported from the Bradwood Landing Project is outside the scope of the project and, consequently, is outside the scope of this EIS.

The Commission issued its Policy Statement on Provisions Governing Gas Quality and Interchangeability in Interstate Natural Gas Company Tariffs (Policy Statement, PL04-3-000) in 2006. Consistent with the Policy Statement, NorthernStar must ensure that the regasified LNG it delivers to interconnecting pipelines meets the gas quality and interchangeability standards of the interconnecting pipelines' tariffs.

FA3-8 The Wahkiakum County Sand Pit site has previously been used successfully for dredge disposal and beach nourishment by the COE. It is an area of known erosion. Therefore we do not believe a modeling study is necessary for the EIS.

FA3-8 | plan to evaluate sediment grain size. Further, the fate and transport of this material is not known, and it is possible that the dredged material would be eroded and deposited in the navigation channel, resulting in an increased need for maintenance dredging. We recommend that modeling be done to evaluate potential turbidity and suspended sediment, that erosion potential be evaluated, that a monitoring plan be developed that includes grain size analysis, and that this information be included in the FEIS.

FA3-9 | In addition, we note that according to a 2006 estimate (p. 3-58), the Sand Pit site has capacity to accept 700,000 cubic yards of dredged material. If NorthernStar initially deposits up to 350,000 cubic yards of dredged material at this location during construction the LNG terminal, only 350,000 cubic yards of capacity would remain to accept materials generated through maintenance dredging. Assuming each maintenance cycle would generate 80,000 cubic yards, that capacity could be exceeded within four dredging cycles. We are concerned, therefore, that the proposed disposal site may not be able to accommodate all of the dredged material generated by the project over time. We recommend that the FEIS conduct the analysis necessary to identify a backup disposal site should one be required.

Invasive species

FA3-10 | Several species of highly aggressive noxious weeds occur in the project area, including Scotch broom, Himalayan blackberry, reed canary-grass, and purple loosestrife (p. 4-91). The DEIS indicates that these invasive species will be removed on the LNG facility site (p. 4-112), the Lower and Middle Svensen island mitigation site (p. 4-151), the Hunt Creek/Clifton Channel mitigation site (p. 4-153) and along the pipeline route (p. 4-117). We note, however, that removal methods are not discussed either in the DEIS, or the "Noxious Weeds and Soil-borne Plant Disease Control Plan" referenced on page 4-117. Page 4-112 indicates that invasive species affecting installed vegetation will be removed by hand, but this is clearly not a tenable solution at the project scale. The DEIS should clarify the applicant's intent in terms of addressing invasive species on the proposed construction and mitigation sites, and identify the control and eradication methods to be used. These methods should be analyzed in terms of their potential ecological impact, and ultimately incorporated into the referenced control plan (and included as an appendix to the FEIS).

FA3-11 | Aquatic invasive species are also of concern. Invasive species appear to be on the rise in the lower Columbia River. Recent reports indicate that 81 organisms, including fish, aquatic plants, crustaceans and worms have been introduced into the lower Columbia River since the mid 1880s (LCREP 2005). We recognize that no ballast water will be discharged into the Columbia River, however, some species can travel on the infrastructure of the vessel or can be discharged from other waste streams. It is unlikely that the rinsing of anchors and chains at the port of origin alone will be sufficient to adequately mitigate the risk caused by the transport and introduction of non-native species. We recommend that the EIS consider, discuss, and require further mitigation measures to adequately prevent the spread of invasive species to and from the Columbia River Estuary. We also recommend that the FEIS include an analysis comparing the physical environment (salinity, temperature) of the likely ports of origin with similar data for the Lower Columbia. If conditions are similar, the potential for impacts is greater. This comparison would assist the applicant in determining if there is any potential for introduction of new species.

Federal Agencies

3

FA3-9 | Based on new information regarding the capacity of the Wahkiakum County Sand Pit site, it is no longer being considered as the only disposal option for maintenance dredging. However, an alternative site has not yet been identified.

FA3-10 | We agree that weed control methods proposed by NorthernStar should be identified. Therefore, we have included a recommendation in section 4.4.2.3 that NorthernStar continue to consult with the COE, FWS, NMFS Oregon and Washington Departments of Agriculture, and other appropriate resource agencies to revise its Noxious Weeds and Soil-borne Plant Disease Control Plan. The final Noxious Weeds and Soil-borne Disease Control Plan should be filed along with agency comments with the Secretary prior to pipeline construction. Noxious weed control methods will be analyzed in terms of their potential ecological impact in the revised BA and EFH Assessment. Directions for accessing NorthernStar's Noxious Weeds and Soil-borne Plant Disease Control Plan via the eLibrary can be found in the response to comment PM6-60.

FA3-11 | Additional information on the potential for the introduction of invasive species to the lower Columbia River through hull fouling has been added to section 4.5.1.1.

Ballast water screening

- FA3-12** The DEIS notes on page 4-66 that in any given year of operation, up to 6.3 billion gallons of water would be withdrawn from the Columbia River for LNG ship ballast and engine cooling while at the Bradwood Landing LNG terminal berth. Because this represents a significant entrainment and impingement risk to juvenile fish, NorthernStar proposes construct a system capable of delivering filtered water to the LNG ships. We applaud this measure, but note that use of this system currently would be completely voluntary. NorthernStar would offer contract incentives to the LNG suppliers to retrofit their vessels to connect with the wharf filtered water supply, but no indication is given as to how successful such incentives might be (or if such incentives have been used successfully in the past). This is a point of concern, particularly if LNG is to be purchased off the "spot market". The "spot market" is generally serviced by uncommitted ships (i.e. those not committed to long-term trades), which are unlikely to see any advantage to retrofitting. We recommend a licensing term that stipulates all carriers servicing the Bradwood Landing LNG terminal will have appropriate screening technology in place within five years.

Frac-Out Contingency Planning

- FA3-13** NorthernStar included a horizontal directional drill (HDD) Contingency Plan (Frac-out Plan) as part of its Application for Certificate of Public Convenience. EPA supports the response measures listed in the document, but we find that the plan lacks detail. Specifically, we recommend that the contingency plan address potential modes of failure and mitigation measures for each phase of the drilling process (pilot hole installation, reaming and swabbing, and pullback), as well as mitigation for frac-outs. This includes mitigation for frac-outs to water, marsh, and uplands. In addition, the contingency plan should identify design and construction measures that will be implemented to prevent frac-outs, and monitoring measures that will occur during drilling. EPA can provide working examples of detailed HDD contingency plans if this would be helpful. Finally, we recommend that the revised HDD Contingency Plan be included as an appendix to the FEIS.

Alternative Analysis - Siting Criteria

- FA3-14** Section 3.1.3 the DEIS examines proposed siting alternatives. In reviewing this section we are concerned that siting alternatives appear to be dismissed based on qualitative observations such as pipeline length. It would be beneficial to provide robust, quantitative siting criteria presented in comparative form that can be objectively evaluated. We recommend that the FEIS provide a more thorough and objective evaluation of the alternative facility locations based on a set of siting criteria including such factors as navigation security risk, environmental impact, zoning restrictions, local support, berth distance to people, berth distance to channel, access (channel depth, width), dredging requirements and visual impact.

Interrelated Activities - Palomar

- FA3-15** In section 2.2, the DEIS identifies nonjurisdictional facilities and interrelated activities. These include electric transmission facilities and three lateral pipelines. The document goes on to correctly note that although these facilities are not regulated by the FERC, they are related to the project and their potential environmental impacts should be considered in this EIS. Since the publication of the DEIS, a fourth potential lateral pipeline has been proposed. The Palomar pipeline is proposing to interconnect with the Bradwood Landing pipeline near Wauna. Because this pipeline, similar to the other three lateral pipelines, would be an interrelated activity, its environmental impacts should be considered, and included in the FEIS.

Federal Agencies

- FA3-12** See our response to comment PM1-31.

- FA3-13** NorthernStar's HDD Contingency Plan is too voluminous to include as an appendix to the final EIS, but was filed as part of its Application for Public Convenience and Necessity (Application). NorthernStar included its revised HDD Contingency Plan (Frac-out Plan) as Attachment B of its Waterbody and Wetland Construction and Mitigation Procedures Plan. Directions for accessing NorthernStar's Waterbody and Wetland Construction and Mitigation Procedures Plan via the eLibrary can be found in the response to comment FA2-17.

NorthernStar's HDD Contingency Plan adequately addresses potential modes of failure for each phase of the drilling process as well as mitigation measures for frac-outs to waterbodies and wetlands. However, mitigation measures for frac-outs to uplands are not addressed by the HDD Contingency Plan. Therefore, we have added a recommendation in section 4.3.2.4 that NorthernStar revise its HDD Contingency Plan to include mitigation measures for frac-outs to uplands. Nonetheless, the FERC staff, and surely NorthernStar as well, would be interested in reviewing the EPA's "working examples of detailed HDD contingency plans." Please send copies of the referenced plans to the FERC staff and NorthernStar.

- FA3-14** We consider pipeline length to be a quantitative factor not qualitative and generally a reasonable predictor of environmental impacts, among other factors. Typically, for any given physiographic terrain the longer the pipeline, the more impacts are expected. Section 3.1.5.3 provides a list of the criteria we used during our evaluation process, including navigation in the waterway, population density, special interest areas, dredging, site availability, terminal size, land use, and other factors. The FERC does not choose the "best" environmental site from among competing regional locations, but rather analyzes each filed project individually on its own merits. See also our responses to comments PM2-23, PM2-27, PM2-29, and PM2-31.

- FA3-15** See our response to comment FA2-15.

United States Department of the Interior

OFFICE OF THE SECRETARY
Office of Environmental Policy and Compliance
500 NE Multnomah Street, Suite 356
Portland, Oregon 97232-2036

9043.1
IN REPLY REFER TO:
ER07/736

Electronically Filed

December 21, 2007

Honorable Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, NE
Washington, D.C. 20426

Subject: COMMENTS – Review of the Draft Environmental Impact Statement for the
Proposed Bradwood Landing LNG Terminal and Pipeline Project, FERC No.
CP06-365-000 et al., Clatsop and Columbia Counties, Oregon and Cowlitz
County, Washington

Dear Ms. Bose:

The Department of the Interior (Department) has reviewed the Federal Energy Regulatory Commission's (Commission) Draft Environmental Impact Statement (DEIS) for the proposed Bradwood Landing Project (Project). The Department offers the following comments for use in developing the Final Environmental Impact Statement (FEIS) for the project.

GENERAL COMMENTS

FA4-1

The proposed Project is one of several LNG terminals and pipelines being proposed simultaneously in Oregon. These projects include the proposed Palomar Pipeline Project (FERC Docket No. PF07-13-000), the proposed Oregon Liquefied Natural Gas Terminal and Pipeline Project (FERC Docket No. PF07-10-000), and the proposed Jordan Cove Liquefied Natural Gas Terminal and Pacific Connector Gas Pipeline (FERC No. CP07-441-000 and CP07-444-000). Each of the proposed LNG and pipeline projects is being developed and evaluated by the Commission through separate but simultaneous regulatory review and permitting processes. The Department is concerned that the Commission is proceeding with the certification of multiple projects without an adequate assessment of the regional demand for LNG and natural gas supplies, and a determination whether that demand is sufficient to justify the need to construct all of the LNG terminals and associated pipelines that are currently proposed for the State of Oregon. Rather than proceeding piecemeal, the Commission should

Federal Agencies

4

FA4-1

See our response to comment PM2-32. The issue of regional planning was also raised by Governor Kulongoski in a letter to the FERC dated February 14, 2008, that Chairman Kelliher responded to on April 2, 2008. The Chairman's letter read in part: "The Commission's policy is to ensure that all proposed projects are environmentally sound and consistent with public safety, and then leave it to the market to determine which projects are constructed. To protect the environment and ensure safety, each individual project must be evaluated on the basis of its site-specific impacts. We therefore review applications for gas projects as they are filed, based on their individual merits." Section 1.1 offers a brief summary about the project purpose and need. The Commission would make its determination of project need in its Order.

K-365

FA4-1 | conduct a comprehensive review of all the current proposals with the intent of identifying the one project or projects most capable of meeting the regional demand with the least socioeconomic and environmental damage. At the very least, the Commission's environmental review should address comprehensively all of the terminal and pipeline proposals that are clearly interrelated and dependent on one another.

FA4-2 | For example, recent applications and the Commission filings related to the Palomar Pipeline Project (FERC Docket No. PF07-13-000) clearly demonstrate that the Palomar Pipeline Project is related to the Bradwood Landing Project. In addition, on June 26, 2007, the Gas Transmission Northwest (GTN) submitted a right-of-way application to the Bureau of Land Management (BLM) for the construction, operation, maintenance, and termination of a 220-mile 36-inch pipeline over public land in the Prineville and Salem BLM districts and the Mt. Hood National Forest. This application, titled the Palomar Pipeline Project, identified the pipeline terminus as a proposed Liquefied Natural Gas terminal near Bradwood, Oregon. The Bradwood Landing DEIS currently under review variously describes the Palomar Pipeline Project as "would potentially connect with the proposed Bradwood Landing Liquefied Natural Gas Terminal" (pg 4-446) and "would bring Canadian and Rocky Mountain gas to the Portland metropolitan area" (pg 5-17). According to the DEIS, only two LNG storage tanks would be constructed at Bradwood Landing; however, all of the figures of the LNG terminal and site presented in the DEIS display three LNG storage tanks. The Palomar Pipeline Project, with its increased natural gas sendout capacity, necessitates the third storage tank. Based on the above information the third tank depicted in the DEIS d clearly demonstrates that the Palomar Pipeline Project is a connected action and must be analyzed in conjunction with the Bradwood Landing Project. At a minimum In assessing the larger, interconnected Bradwood Landing and Palomar projects, the Commission should consider the cumulative impacts of construction and operation of three LNG storage tanks, closely evaluate how increased shipping traffic would affect the aquatic and shoreline environment in the Columbia River and estuary, and include an assessment of impacts along the 200+ mile Palomar Pipeline alignment, including impacts to high quality old growth forest habitat.

FA4-3 | Recent filings with FERC and the Notice of Intent to Prepare an Environmental Assessment for the Proposed Oregon Liquefied Natural Gas Terminal and Pipeline Project and the Jordan Cove Liquefied Natural Gas Terminal and Pacific Connector Gas Pipeline should also be considered. Both of these projects are noted by the Bradwood Landing DEIS but not considered in detail as viable alternatives based on the unsupported conclusion that "on initial consideration they do not appear to be environmentally superior to the Bradwood Landing Project because of the greater length of the sendout pipelines." The Department believes that this conclusion is not warranted without more substantive analysis.

The proposed pipeline route the Oregon Liquefied Natural Gas Project, closely parallels the proposed route for the Palomar Pipeline Project from the four corners intersection of Clatsop, Columbia, Tillamook, and Washington Counties to Molalla, Oregon. Based on this information Oregon Liquefied Natural Gas meets the same purpose and need as the Palomar Pipeline Project for a portion of the project; thus, it must be considered a reasonable alternative for transmission of gas across the Willamette Valley to the Williams Pipeline near Molalla, Oregon.

Federal Agencies

4

FA4-2 See our responses to comments PM1-24 and PM2-15. The outline of a third LNG storage tank is depicted in site maps for the LNG terminal but, as clearly described in the text, only two LNG storage tanks are proposed at this time. Space for a third tank was included in the terminal design to allow for possible expansion in the future, which would require a separate environmental review and approval process.

FA4-3 The Oregon LNG Project and Jordan Cove LNG Project are discussed in section 3.1.3.4. These projects have proposed sendout pipelines that are much longer than the proposed Bradwood Landing pipeline, with associated environmental impacts.

FA4-3 | As demonstrated by the above information and other publicly available information, the proposed Palomar Pipeline Project and proposed Oregon Liquefied Natural Gas Terminal and Pipeline Project cannot reasonably be deemed speculative and must be included in the analysis of the Bradwood Landing Liquefied Natural Gas Terminal and Pipeline as reasonably foreseeable and interconnected activities. FERC reliance on independent environmental reviews of these projects prevents comprehensive decision making on energy policy in the region. Decision making is best served by analyzing these three projects in light of each other given that they meet similar and overlapping purposes and needs.

cont'd

Wildlife Resources

FA4-4 | The Project LNG terminal would be constructed at Columbia River RM 38, and LNG vessels would traverse the Columbia River estuary and lower river to access the LNG terminal. The Julia Butler Hansen National Wildlife Refuge (JBHNR) and the Lewis and Clark National Wildlife Refuge (LCNWR) have lands in the vicinity of the proposed Project and along the LNG vessel transport routes. The JBHNR extends from approximately RM 33.5 to RM 39 along the Columbia River, and includes the Hunting Islands and Price Island in Washington, and Tenasillahe Island, portions of Crims Island, Wallace Island, and several other small mainland parcels in Oregon. The JBHNR was established in 1972, specifically to protect and manage the federally-listed endangered Columbian White-Tailed Deer (CWTD), and now encompasses approximately 6,100 acres. The JBHNR staff actively seeks to lead CWTD recovery efforts, within the JBHNR, as well as on private lands along the lower Columbia River.

The LCNWR was established in 1971 to preserve wetland habitats in the lower Columbia River estuary and serve as a wintering area for migratory waterfowl and shorebirds. The LCNWR boundary encompasses 35,000 acres of tidelands and open water, including 8,313 acres of islands and sandbars between RMs 18.5 and 35 in the Columbia River. Both Refuges are part of the Willapa National Wildlife Refuge Complex. The Project, including the terminal, pipeline, and LNG vessel route, clearly is located within or adjacent to these Refuge lands, and could negatively influence Refuge management and recovery activities on Refuge and adjacent private lands.

FA4-5 | The proposed pipeline (DEIS Appendix B) would pass through approximately 15 miles of CWTD habitat (from pipeline mile 4 to mile 19). There would be considerable disturbance to the CWTD during pipeline and terminal construction. It is likely that CWTD would temporarily abandon areas within about 1,000 feet of active work sites. Abandonment of project work areas by CWTD during the fawning season of June 1 to July 15 is likely to cause adverse effects to any fawns occurring within that zone. During the first 2-4 weeks of life, fawns rely entirely on remaining motionless and hidden to avoid predators. Thus, they are vulnerable to being crushed by construction vehicles. Further, CWTD fawns need to nurse 5-6 times per day. Fawns hidden near project construction sites would not likely be nursed for the entire length of time each day that construction activities occurred, negatively affecting CWTD fawn survival. The DEIS states that the construction period for the pipeline would be March to September, with the caveat that ground-disturbing activities in suitable CWTD habitat would be scheduled outside the fawning season, "where possible". The pipeline route between mile 4 and

Federal Agencies

4

FA4-4 Additional analysis of potential impacts on the JBHNR and LCNWR due to the transit of LNG vessels along the waterway has been added to section 4.5.1.3. In addition, impacts on the JBHNR and LCNWR due to construction and operation of the LNG terminal are discussed in section 4.5.1.6.

FA4-5 Section 4.6.2.3 has been revised to include additional discussion of the potential impacts on Columbian white-tailed deer from construction of the proposed pipeline. In addition, a condition has been added stating that pipeline construction activities should not occur within potential habitat for Columbian white-tailed deer (MPs 4 to 19) between June 1 and July 15.

FA4-5 | mile 19 is all suitable CWT habitat. The Department recommends that pipeline construction activities of any kind not occur between mile 4 and mile 19 during the period June 1 – July 15. This should be included in the FEIS.

FA4-6 | The Bradwood Landing terminal and storage tanks would occupy the narrow strip of bottomland habitat that separates the Columbia River from the conifer-forested hills of the Coast Range. This narrow strip is CWT habitat and likely serves as a travel corridor for deer moving from the Wauna/Westport area to Tenasillahe Island and/or Brownsmead, and vice versa. Deer moving between Tenasillahe and Puget Islands might also use this corridor. Such movements between subpopulations may be infrequent but are important in maintaining gene flow in the population. Each existing CWT subpopulation is small (<200 individuals) and at risk of inbreeding depression unless there is occasional genetic exchange with other CWT subpopulations. It is likely that during the three-year construction phase, CWT migration in this corridor would be completely excluded from the terminal area due to the high level of human disturbance expected with a large, industrial construction project. Operation of the Bradwood Landing terminal facility, with its surrounding fences and round-the-clock activities, may block or interfere with CWT movements between CWT subpopulations. This could have serious long-term consequences for the genetic fitness of the affected CWT subpopulations, especially the Tenasillahe Island subpopulation. For the above reasons, as proposed, the Project is likely to adversely affect the CWT. On that basis, the Commission needs to request formal consultation on this proposed action in accordance with the requirements of section 7 of the Endangered Species Act (ESA).

FA4-7 | Further, the DEIS states (page 4-329, first paragraph) that a 200-yard fixed security zone would be established when an LNG vessel is moored at the Bradwood Landing Terminal. The Bradwood Landing terminal is adjacent to the Clifton Channel, which is also the access point that JBHNR personnel and barged equipment must use to travel back and forth to the JBHNR's Tenasillahe Island southern docking facility. Although the paragraph goes on to say that non-LNG vessels would be routinely allowed to transit the safety/security zone based on a case-by-case assessment conducted on scene, it is unclear from the description whether the security zone would encompass the entire Clifton channel or only a portion of the channel, or whether the main Columbia River ship channel would be included in the safety/security zone restrictions. Because Tenasillahe Island contains one of only three secure subpopulations of the federally endangered CWT, and active management of CWT is a main priority for JBHNR, it is imperative that overwater access to Tenasillahe Island not be restricted.

FA4-8 | Project-related impacts are generally identified and analyzed only for areas within the project's physical footprint. However, project-related impacts to the aquatic and terrestrial environment would extend out from the project footprint. For instance, aquatic impacts at stream crossings would not be limited to the footprint of the crossing only, but would occur both up-and-downstream from the site and into the riparian/terrestrial habitats adjacent to the stream crossing. Additionally, pipeline construction activities will have impacts to habitats that occur adjacent to and beyond the pipeline construction corridor. These impacts include loss of large wood, loss of thermal shading, modification of surface and sub-surface hydrology, and sediment transport and erosion. Within forested habitat, the pipeline corridor would create permanent

Federal Agencies

4

FA4-6 Additional information relating to the potential impacts on Columbian white-tailed deer movement and gene flow due to construction and operation of the LNG terminal has been added to section 4.6.2.2. In compliance with section 7 of the ESA and the MSA, the FERC staff prepared a BA and EFH Assessment for the Bradwood Landing Project and submitted it to the FWS and NMFS in March 2007. Based on comments from the FWS and NMFS, the FERC staff is currently revising the BA and EFH Assessment and will resubmit the BA and EFH Assessment to the agencies with a request to initiate formal consultation.

FA4-7 Overwater access to Tenasillahe Island would not be restricted. We have added a new figure to the EIS (see figure 4.8.1-1) that depicts the extent of the security zone at the LNG terminal.

FA4-8 We believe that the impacts of the project, both direct and indirect are adequately addressed in the EIS. Assurance of mitigation for project impacts is discussed in the response to comment FA2-10.

FA4-8 | edge habitat and reduce the amount of interior habitat. The impact of “edge effects” on habitat quality would extend approximately 200 feet or more, depending on the habitat affected.

cont’d

Accordingly, the FEIS should include additional analysis of all Project construction sites (pipeline, access roads, temporary extra workspaces, etc.) to determine where riparian and aquatic habitats occur within approximately 200 feet of pipeline construction activities. The FERC should assess the amount of adjacent habitat directly and indirectly affected by construction activities, include this acreage when considering appropriate mitigation requirements, and ensure that all adverse effects from construction activities are fully mitigated.

FA4-9 | The Project mitigation plan should include compensation for impacts to individuals of ESA listed and non-listed terrestrial and aquatic species, and their future offspring, from project construction and operations effects. An example of how to assess and compensate for project-related direct and indirect impacts to individuals of a species is the Habitat Equivalency Analysis, widely used in Natural Resource Damage Assessment.

FA4-10 | Should blasting be required during construction of the terminal or the pipeline, species-specific work windows should be observed. Any additional disturbance-related effects from blasting should be further analyzed and potential impacts to trust resources, particularly threatened and endangered species, should be considered. Blasting can have adverse effects up to one mile from the blast site. The potential effects to listed species from blasting will need to be evaluated and considered in the Commission’s biological assessment and final environmental document.

FA4-11 | In addition the JBHNR and LCNWR are of vital interest to the National Park Service (NPS) as they further the mission of the Lewis and Clark National Historic Trail to preserve and maintain the visual, educational, natural, and recreational resources along the Lewis and Clark National Historic Trail.

Fish Resources

FA4-12 | As currently described in the DEIS (pages 4-242 to 4-246), the proposed Salmon Enhancement Initiative (SEI) lacks the level of specificity required to adequately evaluate its potential effectiveness. With no specific details about the nature of future SEI projects, it is extremely difficult to assess project benefits or impacts. Further, because the DEIS indicates that FERC has no authority to implement the SEI; there are no assurances that the SEI would be implemented. It is therefore unclear how to evaluate the SEI in either the context of the National Environmental Protection Act (NEPA) or the ESA.

As described on Pages 2-32 and 4-242, the SEI, would be...”entirely voluntary, but in addition to other mitigation measures used to avoid, minimize, rectify, reduce, and/or compensate for environmental impacts that are required by the regulations.” Page 2-32 additionally indicates “The long-term implementation of this voluntary SEI *is outside of FERC’s regulatory authority*” (emphasis added). The final environmental impact statement should identify the authority, including the specific language, which controls the Commission’s inability to implement a voluntary conservation program, such as the SEI, as part of an LNG certification. On Page 4-243, the DEIS states “The primary purpose of SEI projects would be the recovery of

Federal Agencies

4

FA4-9 | See our response to comment FA2-10.

FA4-10 | Section 4.5.2.3 has been revised to include a recommendation that NorthernStar consult with the NMFS, FWS, ODFW, and other appropriate agencies while developing its Blasting Management Plan, which should be filed with the Secretary prior to construction.

FA4-11 | The LCNHP is discussed in sections 4.7.1.4 and 4.9.1 of the EIS. Two elements of the LCNHP, Cape Disappointment State Park (including the Lewis and Clark Interpretive Center) and Fort Stevens State Park are overlapped by the Zones of Concern for LNG marine traffic in the waterway to the Bradwood Landing terminal (see figure 4.7.1.1). Station Camp, Dismal Nitch, Fort Columbia, Fort Clatsop, Netul Landing, and the other elements that comprise the LCNHP are located outside of the Zones of Concern and would not be affected by the project. As stated in the EIS, given the measures to be implemented by NorthernStar and the Coast Guard under the conditions of its WSR, we believe there is little potential for an LNG spill that could have an adverse effect on the LCNHP. Nor do we believe that the project would have any significant adverse visual impacts on the LCNHP and visitors to the park elements. LNG carriers traversing along the waterway to and from the Bradwood Landing LNG terminal would represent only a 7 percent increase in commercial ship traffic on the lower Columbia River. The LNG carriers would be visible to users of the various elements of the LCNHP along the shore of the waterway for several minutes at a time.

FA4-12 | NorthernStar’s SEI is not a part of the compensatory mitigation for unavoidable impacts associated with the project. The SEI is being offered over and above the regulatory requirements from multiple agencies to provide mitigation (including measures to avoid, minimize, and compensate) for impacts on salmonids and their habitats as a result of the Bradwood Landing Project.

While voluntary, NorthernStar considers the SEI an integral part of the project proposal. NorthernStar indicated that multiple agencies would make the SEI a required component of the project through their permits. Furthermore, NorthernStar stated that it is developing a memorandum of agreement addressing the binding nature of the SEI.

FA4-12 cont'd ESA-listed salmon and steelhead stocks as well as the general ecological enhancement of the lower Columbia River ecosystem.” This statement is very consistent with Section 7(a)(1) of the ESA, which directs *all* Federal agencies to utilize their authorities in furtherance of the purposes of the ESA by carrying out programs for the conservation of species listed pursuant to the ESA. The Department supports the development of programs to conserve listed species, and recommends that in both the final environmental impact statement and any pending biological assessment that the SEI be proposed by the Commission as part of the Project Description, and that the Commission clearly retain discretion to ensure successful implementation of the SEI. Recreation and Aesthetic Resources

FA4-13 Potential impacts on essential fish habitat (EFH), especially for salmonids, may occur from a number of activities during construction and operation of the Project. These include habitat modification or loss from dredging, placement of fill, bank stabilization, removal of shoreline vegetation, waterway crossings for pipelines and conduits, removal of riparian vegetation, channel realignment, and construction of docks and piers. In particular, converting 46.1 acres from an Aquatic Conservation Zone (AC-2) to Aquatic Development (AD) to permit dredging for a turning basin may eliminate EFH not readily replaced in the same reach of the Columbia River. It is also in conflict with an Oregon state-wide planning goal to protect estuarine resources. Actions within AC-2 zones should conserve, protect, maintain or enhance natural resources, and not cause major alterations to the estuary. Habitat enhancement at river sites some distance from Bradwood Landing, and offered as mitigation, are not sufficient mitigation measures for dredging in a conservation zone. Impacts to EFH, due to construction activities, need to be comprehensively analyzed in the FEIS. Additional mitigation for impacts due to dredging in the conservation zone should also be included in the FEIS.

Water Resources

FA4-14 The DEIS states (page 4-131, paragraphs two and three under the JBHNWR and LCNWR) that “potential impacts resulting from LNG marine traffic associated with the proposed project would be limited to increased shoreline erosion and an accidental or intentional release of LNG during transit of the LNG vessels.” While erosion of undiked islands of the LCNWR is a concern, erosion of dikes on the mainland and Tenasillahe Island Units of the JBHNWR, which protect sensitive CWTd habitat from the adjacent river flooding, could potentially cause serious problems to JBHNWR habitat over time. In light of this, the Department recommends additional analysis to determine what the extent of the erosion problem could be from LNG tankers to the JBHNWR dikes, and identify mitigation measures to be instituted to stop the erosion should the problem become serious enough. If an accidental or intentional release of LNG were to occur, it could cause serious impacts to the habitat and wildlife of JBHNWR and LCNWR, with Tenasillahe Island and the Mainland Refuge Unit being especially vulnerable to adverse effects. An LNG release and subsequent fire could potentially cause the loss of an entire sub-population of CWTd

FA4-15

FA4-16 The DEIS does not adequately evaluate the impacts associated with annually withdrawing 6.3 billion gallons of water from the Columbia River for LNG vessel ballast and engine cooling water. For instance, the applicant proposes contract incentives to LNG ships outfitted with

Federal Agencies

4

FA4-13 Potential impacts on EFH are summarized in sections 4.5.1.2, 4.5.2.2, and 4.5.3.2. In addition, sections 4.5.1.1, 4.5.2.1, and 4.5.3.1 discuss the potential impacts of the proposed project on aquatic resources (which include EFH). Because the EIS is a summary document, we feel that the analysis provided on EFH adequately meets NEPA requirements. However, a comprehensive analysis of potential impacts on EFH due to the Bradwood Landing Project will be included in the revised BA and EFH Assessment.

The adequacy of the Compensatory Mitigation Plan is discussed in the response to comment FA2-10. Directions for accessing NorthernStar's Compensatory Mitigation Plan via the eLibrary can be found in the response to comment PM6-11.

FA4-14 As discussed in section 4.1.2.3, the potential impacts of LNG carriers on shoreline erosion along the LNG marine waterway are undergoing review and will be addressed in further detail in the BA.

FA4-15 Section 4.5.1.3 has been revised to reflect potential impacts on the JBHNWR and LCNWR due to an accidental or intentional release of LNG along the waterway for LNG marine traffic.

FA4-16 Potential impacts on aquatic resources due to water intake for ballast and engine cooling are discussed in section 4.5.2.1. See also our response to PM1-31. Section 4.5.2.1 has been revised to include a discussion of the potential impacts on aquatic resources in the event that the screened water supply system would not be functional or would not be used for a period of time at the LNG terminal. Additional information on the potential for the introduction of invasive species to the lower Columbia River through hull fouling has been added to section 4.5.1.1.

Federal Agencies

4

FA4-16 appropriate screening to ensure fish and other aquatic organisms are not entrained into an LNG vessel, or unwanted organisms are not introduced from ballast water outflow. There are no assurances, however, that appropriate ballast water management, including screening, would be a requirement for LNG ships berthing at the Bradwood Landing facility. The FERC should evaluate the potential impact to the aquatic environment, particularly to anadromous salmonids and lamprey species that would occur absent the screening system, as well as the potential for the introduction of nuisance species from ballast water from LNG vessels, and from nonnative species associated with vessel fouling.

FA4-17 To minimize the potential of spreading noxious weeds, the applicant should be required to power-wash all construction equipment at a self-contained site before being transported to and/or from the construction right-of-way. This should be further analyzed in the FEIS.

FA4-18 Lewis and Clark National Historical Park (Lewis and Clark NHP) is located within the lower Columbia River Estuary and has lands within the Young's Bay watershed, along the Oregon Coast south of the south jetty, and along the headlands of the southern Washington Coast near the north jetty. The NPS is concerned about the increased potential for spills with the significantly additional vessel traffic, and the tremendous ecological effects that could occur with a spill. Analysis of this increased threat from oil spills and appropriate mitigation should be included in the FEIS.

Recreation Resources

Lewis and Clark National Historic Trail

Background

The Lewis and Clark National Historic Trail (NHT), defined as the outbound and return route of the 1804-1806 Corps of Discovery Expedition, was authorized in a 1978 amendment to the National Historic Trails Act, with administrative responsibility assigned to the NPS. In authorizing the NHT, NPS was not given ownership of lands along the route. Rather, administrative responsibilities are carried out through partnerships with federal, state and local agencies, as well as private or non-profit entities that own and manage lands that contribute to the NHT mission. As part of this collaborative approach, the NPS trail administrators might advocate on the behalf of partners in issues that may adversely affect cultural, natural, recreational, educational or visual resources on or adjacent to the NHT, or in actions that may adversely affect human health and safety proximate to the NHT.

In western Oregon and Washington, the NHT follows both the historic and contemporary course of the Columbia River, and related terrestrial sites used by the Corps of Discovery during fall and winter 1805-1806. In Clatsop County, Oregon and Wahkiakum County, Washington, partners with missions and responsibilities that support or enhance the public's enjoyment of the NHT include Lewis and Clark National Historical Park, U.S. Fish and Wildlife Service Lewis and Clark Wildlife Refuge and Julie Baker Hanson Refuge for the Columbian Whitetail Deer, and Clatsop State Forest. In particular, Lewis and Clark National Historical Park includes NPS sites at Station Camp and Dismal Nitch on the Washington shore, in addition to Fort Clatsop

FA4-17 See our response to comment FA3-10.

FA4-18 As discussed in section 4.3.2.2, fuel on each ship is protected by the vessel's double hull. Furthermore, each LNG ship would maintain a SOPEP as required by international convention. The SOPEP would comply with MARPOL [marine pollution] 73/78 Consolidated Edition 2002 Annex 1 Regulation 26, which requires every oil tanker of 150 tons gross and above, and every ship of 400 tons gross and above to carry an approved SOPEP.

and Neutel Landing in Oregon. This national park now also administratively subsumes the state park areas bordering the Columbia River Estuary, specifically Fort Stevens (Oregon), Cape Disappointment (Washington) and Fort Columbia (Washington) State Parks. Please note that Fort Columbia and Cape Disappointment State Parks also receive separate protection under the Land and Water Conservation Fund Act (see below).

As units of the National Park System, the Lewis and Clark National Historic Trail and Lewis and Clark National Historical Park are held to the standards set in the 1916 Organic Act to: "...conserve the scenery and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations." (16 U.S.C. § 1)

It is the goal of the NHT administration to maintain the visual, educational, natural, recreational and cultural resources along the NHT in the conditions observed by the Corps of Discovery 200 years ago. Clearly, many sections of the NHT have already been greatly altered by modern development. This does not mean that further development and use in these sections are acceptable without carefully considering the impacts and alternatives. There are several aspects of the proposed Bradwood Landing Project that have the potential to adversely impact resources important to the integrity, use and enjoyment of the NHT.

FA4-19 Under the Outdoor Recreation Act of 1963, the Secretary of the Interior is directed to provide technical assistance to states, local governments and private interests to promote the conservation and utilization of recreation resources. The NPS provided community assistance to the Lower Columbia River Water Trail—a 146-mile water trail from Bonneville Dam to the Pacific Ocean that people in non-motorized boats can safely travel for day or overnight explorations. There are multiple launch points and campsites along the river. We are concerned with the direct and indirect impacts that heavy shipping traffic and the terminal site will have on the water trail's recreational experience.

FA4-20 The DEIS (page 4-277 under the heading of the Julia Butler Hansen National Wildlife Refuge) states that "JBHNWR has no developed recreational facilities." That statement is incorrect. The Refuge has several public use facilities. The closest facility to the proposed LNG terminal is the Tenasillahe Island dike which is open to the public, allowing JBHNWR visitors to access the periphery of the island for wildlife viewing opportunities. This dike includes areas directly adjacent to the Clifton Channel and the Columbia River shipping channel, where LNG vessels would travel. In addition, public recreational facilities are located at the JBHNWR headquarters off of Steamboat Slough Road, at the Highway 4 viewing site, and along the mainland dike road surrounding JBHNWR. The mainland dike road is used extensively by the public for fishing and wildlife viewing opportunities, and includes access by vehicle traffic to areas directly adjacent to the Columbia River shipping channel, where LNG vessels will travel.

FA4-21 Reduction in fish populations, with related reduction recreational fisheries, is counteractive to NPS goals to preserve wildlife and provide appropriate recreational opportunities. Marine traffic associated with LNG operation will further impact recreational use of the Columbia River due to the safety zone requirements for the tankers. This unavoidable situation will be a significant adverse impact on recreational use of river portions of the NHT.

Federal Agencies

4

FA4-19 We have revised applicable portions of section 4.7 to discuss the Lower Columbia River Water Trail.

FA4-20 Sections 4.7.1.4 and 4.7.2.6 have been revised to include information regarding the developed recreational facilities at the JBHNWR.

FA4-21 As discussed in section 4.7.1.4, we do not believe that LNG marine traffic in the waterway to the proposed Bradwood Landing LNG terminal would have any significant impacts on recreational users of the lower Columbia River.

FA4-22 Based on our comments the Department believes that a more comprehensive analysis of recreational impacts, as identified above, should be included in the FEIS. Further, there is no indication that any direct contact was made with the NPS, even though the Lewis and Clark National Historic Trail was identified as a national resource that would be adversely affected by the construction and operation of the Bradwood Landing LNG depot. FERC and the applicant should contact NPS prior to the development of the FEIS. The appropriate point of contact for NPS can be found at the end of this letter.

Visual and Aesthetic Resources

FA4-23 The construction of the two (or three) LNG storage tanks will adversely impact the landscape scene from the NHT and from roadways adjacent to the shore. Structures the height of 14-story buildings set against the backdrop of state forest lands will be particularly noticeable due to the contrast in materials and reflectance. This is of particular concern since National Heritage Area status is being sought for the Lower Columbia Basin, which would complement the mission of the Lewis and Clark NHT. There was no mitigation in the DEIS that addressed this impact.

Lighting of the industrial installation would adversely impact the visual scene as experienced by Lewis and Clark 200 years ago by reducing nighttime dark sky conditions. The lighting plan for the Bradwood Landing facility was not available at the time of the DEIS review, so we could not determine if this issue was sufficiently considered and adequate mitigation proposed.

A more comprehensive analysis of visual and aesthetic resources and appropriate mitigation should be included in the FEIS

Human Health and Safety

FA4-24 Much of the public debate over the Bradwood Landing LNG facility focused on the perceived threats to human health and safety by leaks from or attacks on tanker ships or the regassification facility. This issue is of concern because NPS units are charged with providing for human safety first and foremost. For the NHT administration, this means that NPS promotes actions and services that provide the highest level of safety along the trail corridor. Based on models that predict a two-mile area of impact should a one-meter breach occur, adequate safety personnel are not available in Clatsop and Wahkiakum Counties to respond to the incident. Even if sufficient personnel and equipment were added to local resources, the impact of such an event would be devastating to the local population and visitors in the area, in terms of loss of life or injury, loss of property, and economic loss. A more comprehensive analysis of human health and safety impacts as well as emergency response procedures should be included in the FEIS.

Land and Water Conservation Fund Act

In addition to units of the National Park System, the NPS also has oversight of property protected by Section 6(f) of the Land and Water Conservation Fund (LWCF) Act. Under Section 6(f) and 36 C.F.R. Chapter I, Part 59, when a conversion of an LWCF-protected site

Federal Agencies

4

FA4-22 Section 4.9 of this EIS was revised to reflect the fact that staff did contact representatives of the NPS regarding the LCNHT. Our analysis found that the project would not have any adverse effects on the LCNHT, and the Oregon SHPO concurs with that finding.

FA4-23 The EIS contains a rigorous analysis of potential visual impacts, including computer simulations. As discussed in section 4.7.2.7, the LNG terminal structures would be painted to reduce visual impacts. Local planners would be consulted for color tones and hue selections. Colors of building materials suitable for the facility purpose would be chosen to blend into the existing visual environment. From the river, the two LNG storage tanks would be seen against the backdrop of the forested basalt hills. Those forested hills would partially block views of the LNG terminal from the south, along Highway 30.

The proposed Bradwood Landing LNG terminal is located in an area surrounded by residential, commercial, and industrial facilities. The community of Clifton is to the west, the city of Cathlamet is to the north, and the Wauna mill is to the east. So night lighting sources already exist in the project area.

In addition, section 4.7.2.7 includes a discussion of potential impacts from lighting at the LNG terminal. NorthernStar would minimize the number and intensity of facility lighting whenever possible. Down-shielding lights would also be used whenever possible to reduce off-site light scatter and illuminating of facility structures. NorthernStar would work with local planners to minimize the impacts of nighttime lighting on surrounding areas through installation of appropriately focused lighting fixtures. Most of the lighting would be located in internal areas of the facility and would, therefore, not have a significant impact on surrounding areas (see section 4.5.2.1). Overall, lighting impacts would be less than those from other developed areas along the river.

The lower Columbia River has not yet been officially designated as a Natural Heritage Area. The LCNHT is discussed in sections 4.7 and 4.9.

FA4-24 We believe the analysis of human health and safety impacts in the EIS is adequate. As discussed in section 4.11.6, an Emergency Response Plan must be submitted for FERC review and approval before any final approval to begin construction and is therefore not required at this time. Also see the response to PM1-1.

occurs, replacement property of current fair market value and of reasonably equivalent usefulness and location must be provided. The Secretary of the Interior must approve any conversion. Section 6(f) protection applies to any property that received grant funding from stateside LWCF, regardless of whether it was an acquisition or development, and to any property that served as a conversion replacement site. The DEIS does not discuss Section 6(f) or the LWCF program, an important layer of federal protection beyond NPS and Fish and Wildlife Service lands.

FA4-25 | On the Washington side, the following LWCF sites appear to fall within the "zone of concern":

- Cape Disappointment State Park
- Various WDFW water access points along the Columbia River (potentially)
- Various WDFW water access points along the Elochoman River (potentially)
- Erickson Park in Cathlamet

The FEIS should include an analysis of impacts to LWCF resources and develop appropriate mitigation for those impacts. In order to do this the Recreation Conservation Office (RCO, formerly known as the Interagency Committee for Outdoor Recreation or IAC) administers LWCF sites in Washington and should be consulted regarding this project. The RCO contact for Washington state is:

Ms. Kaleen Cottingham
Director

Re: Draft Environmental Impact Statement for the Bradwood Landing Liquefied
Natural Gas Terminal and Pipeline Project (Docket No. CP06-365-000, *et al.*)

Dear Secretary Bose:

Thank you for the opportunity to comment on the Federal Energy Regulatory Commission's (FERC) August 2007 Draft Environmental Impact Statement (DEIS) for the Bradwood Landing Liquefied Natural Gas Terminal and Pipeline Project (CP06-365-000, *et al.*). The DEIS states that Bradwood Landing LLC and NorthernStar LLC are proposing to construct and operate several facilities located at the Bradwood Landing LNG terminal along the Columbia River at river mile 38, in Clatsop County, Oregon, as well as a proposed 36.3-mile-long pipeline in Columbia County, Oregon and Clatsop County, Washington.

As the Nez Perce Tribe (Tribe) communicated to FERC during early scoping in or around October 2005 and January 2006 the Tribe is not opposed to LNG development in general. While the Tribe supports sources of energy that decrease reliance on hydropower, the Tribe is skeptical of projects that may result in more harm to endangered and threatened aquatic wildlife. Therefore the Tribe has a paramount interest in the development and review of this project based on the high risk of significant and permanent injury to threatened and endangered salmon and steelhead that the project poses. The Tribe has devoted substantial time and resources to the recovery of these listed species, and any project with the potential to further degrade existing habitat is of critical concern to the Tribe.

The Columbia River Salmon are integral to the cultural, spiritual, and physical health of the Tribe. As such, the Tribe reveres the water and the fishery it supports. For thousands of years the Columbia River provided life and sustenance to the Nez Perce people. However, heavy development and poor management decisions have seriously degraded salmon and steelhead habitat in the Columbia River and its tributaries. The Columbia River estuary, which is within the geographic focus of the project, serves an essential function in the lifestages of migrating

Native American Tribes

1

K-376

December 21, 2007
Nez Perce Tribe Bradwood Landing DEIS Comments
Page 2 of 8

threatened spring, summer, and fall chinook salmon, as well as steelhead. Many of these fish come from hatcheries operated or managed by the Tribe. Thus, any activities that potentially threaten these very important resources are of great concern to the Tribe.

NA1-1 Despite clearly articulating several concerns to FERC about this project, the Tribe is troubled to see that the DEIS does not reflect any meaningful change in the project's posture or direction. This project, as described in the DEIS, will likely cause substantial and irreparable damage to listed salmonid species in the Columbia River and its tributaries to which the Tribe has a treaty-reserved right. Based on the Tribe's review of the DEIS and the comments provided by the Columbia River Inter-Tribal Fish Commission¹ (CRITFC), the project will unnecessarily expose 13 federally listed threatened or endangered salmonid species, several non-listed species, and critical designated habitat in the Lower Columbia River estuary to conditions likely resulting in severe and irreparable injury. The deleterious effects of this project on fish and wildlife productivity in the Columbia River Basin are not confined to the project area itself. Indeed, the project's deleterious effects on salmon and steelhead, and on the estuary that serves as critical habitat, will impact the abundance and productivity of these species throughout their life cycle as they migrate to and from their natal streams.

The Tribe concurs with and incorporates CRITFC's comments with this letter, and for the reasons articulated below, opposes the Bradwood Landing project as described in the DEIS because it presents an unacceptable risk of substantial and permanent harm to salmon and steelhead and to the critical estuarine habitat on which they depend, in turn adversely impacting the Tribe's treaty fishing rights counter to the United States' trust responsibility. Accordingly, the Tribe recommends at a minimum that FERC require the applicant NorthernStar LLC to conduct further studies and analysis before a final EIS is issued on the proposed project.

The Project Will Further Degrade the Columbia River Estuary

NA1-2 The sensitive Columbia River Estuary stands to be impacted in the short and long term with this project. First, the destruction of critical estuary habitat will occur as a direct result of the dredging and development of the project site. Particularly harmful impacts will result from the dredging in Clifton Channel to accommodate the massive LNG tankers. The dredging and related activities will impact both Cathlamet Bay, and the nearby Lewis and Clark Wildlife Refuge.

NA1-3 In the ongoing case of *National Wildlife Federation v. National Marine Fisheries Service*, the Oregon federal district court has repeatedly directed NOAA Fisheries to revise its

¹ In 1977, CRITFC was established by the four Columbia River treaty tribes: the Nez Perce Tribe, the Confederated Tribes of the Umatilla Indian Reservation, the Confederated Tribes of the Warm Springs Reservation of Oregon, and the Yakama Nation. CRITFC functions to protect, promote, and enhance the Columbia River Basin's anadromous fish resources consistent with the treaty-secured interests of its member tribes by formulating a broad, general fisheries program, and providing technical and legal support.

Native American Tribes

1

NA1-1 See our response to comment PM3-68.

We have modified section 4.9.3 to disclose that the Nez Perce Tribe has notified the FERC of its concerns about potential project impacts on federally-listed threatened and endangered salmon species and the lower Columbia River estuary. We have addressed the comments of the CRITFC elsewhere in this EIS (see our responses to letter NA2).

NA1-2 Sections 4.5.2 and 4.6.2.2 discuss both temporary and permanent impacts on aquatic and terrestrial wildlife as well as unique and sensitive wildlife habitats due to construction of the LNG terminal.

NA1-3 This is a reference to a case involving the NMFS for a different project.

Biological Opinion (BiOp) regarding the operations of the Federal Columbia River hydropower system (FCRPS) and work with resource managers to develop a plan that complies with the Endangered Species Act's mandates to ensure that actions do not jeopardize the survival and recovery of listed fish or adversely affect critical habitat.² The latest draft BiOp, released by NOAA Fisheries in 2007, continues to identify the Columbia River estuary as important to salmon recovery. The document notes that the success of the plan depends on a variety of factors, including "biological productivity in the estuary/near shore ocean environment." NOAA Fisheries Draft Supplemental CA, at 8-6. The document also states that "key limiting factors" for ESA-listed salmonids include the estuary. *See, e.g.,* NOAA Fisheries Draft Supplemental CA, § 8.2, at 8.2-4. NOAA Fisheries also notes that if "habitat actions" to improve quality and access are undertaken in the estuary, there is a survival benefit of approximately 9%, and recovering estuarine habitat would result in "positive effects" that "will be long-term". *Id.* at 8.2-4 to 8.2-5.

Although the remand process is still ongoing, NOAA Fisheries has expressed a firm commitment to restoring the Columbia River estuary to promote the recovery of listed salmonids. The DEIS fails, however, to address how the proposed project will accommodate or otherwise address the mitigation measures that NOAA Fisheries will implement following approval by the court.

The Treaty of 1855

The anadromous salmonid fish species that rear, transit and hold in the Columbia River Estuary have played a central role in the culture and livelihood of the Tribe since time immemorial. Over 150 years ago the Nez Tribe entered into a treaty with the United States. Treaty of June 11, 1855; 12 Stat. 957 (1855). Under the terms of the Treaty, the Tribe ceded vast tracts of land in what are now Idaho, Oregon and Washington in exchange, among other guarantees, for the United States' assurance that the Tribe will retain reserved fishing rights at all usual and accustomed places, and hunting, gathering and pasturing rights on open and unclaimed lands.

The Treaty of 1855 is the supreme law of the land. U.S. Const. Article VI, Clause 2. It is well-established as a matter of law that the Tribe has a treaty-protected right in the anadromous salmonids that spawn in the headwaters, tributaries and mainstream of the Columbia River and which pass through the Tribe's usual and accustomed fishing places on their journey to and from the ocean. Thus, any activities on the Columbia River or its tributaries that may impinge on the fish, and in turn the treaty right to take fish, are of paramount concern to the Tribe.

² *E.g., National Wildlife Federation v. National Marine Fisheries Service*, 2005 WL 1278878 (D. Or. 2006), *aff'd*, 481 F.3d 1224

Native American Tribes

December 21, 2007
Nez Perce Tribe Bradwood Landing DEIS Comments
Page 4 of 8

Consistent with the Tribe's treaty rights, the Tribe maintains a large Department of Fisheries Resource Management (DFRM), the largest tribal fisheries department in the country. The staff of DFRM manages a wide variety of programs, including numerous hatchery and production programs, harvest planning and regulation, and habitat protection and enhancement programs. Most of the DFRM resources are applied to programs devoted to rearing and protecting salmon and steelhead on their journey to and from the ocean. The proposal to build a LNG landing facility in the Columbia River Estuary, where all migrating salmon and steelhead spend time, could severely impact a wide variety of projects that the DFRM engages in. Thus, the Tribe is very concerned about this project, and its impact on the fishery resource, that in turn affects the Tribe's ability to exercise its treaty right to take fish at all usual and accustomed places.

The DEIS' Characterization of the Tribe's Treaty-Reserved Fishing Rights Is Erroneous

The Tribe strongly disagrees with FERC's assertion, stated below, maintaining that the proposed project will not adversely affect the Tribe's treaty-reserved rights:

Comments were received during scoping regarding potential impacts of the project on Indian treaty fishing rights. Four Indian tribes hold treaty fishing rights for ceremonial, subsistence, and commercial purposes in the Columbia River above Bonneville Dam. Although the court has approved the 2005-2007 Interim Management Agreement providing that the Treaty Tribes and the States of Oregon and Washington may agree to a fishery for the Treaty Tribes below the Bonneville Dam, no agreement has been negotiated that would authorize Indian treaty fishing in the area adjacent to the proposed site. No Indian treaty fishing sites have been identified along the waterway for LNG marine traffic. However, salmon migrating to and from sites above Bonneville Dam could be affected by the passage of LNG ships during operation of the proposed project. As discussed in section 4.5.1.1, NorthernStar would avoid, minimize, reduce, rectify, and compensate for impacts on fishery resources during construction and operation of the project. Therefore, no significant adverse impacts on Indian treaty fishing rights are anticipated as a result of the proposed project. In fact, implementation of NorthernStar's SEI is expected to result in a net benefit to fishery resources on the lower Columbia River.

NA1-4 FERC's interpretation mischaracterizes the scope and extent of the Tribe's treaty-reserved fishing rights. Most importantly, the nature and scope of the treaty fishing rights reserved by the Nez Perce Tribe (and the other CRITFC-member Tribes) is-by the language of the Treaty itself-the right to take fish at all usual and accustomed places. The 2005-2007 *US v. Oregon* Interim Management Agreement in no way alters the fundamental scope of the Tribe's treaty-reserved fishing rights, but simply institutes a procedure between the co-managers with respect to potential lower river Treaty fisheries. FERC may not rely on the procedure in the 2005-2007 Interim Management Agreement to mischaracterize-and limit-the nature and scope of the Tribe's fishing rights set forth in the Treaty of 1855. Nor may FERC avoid analyzing the impact of the project on the Tribe's treaty fishing rights over the entire life of the project.

Native American Tribes

1

NA1-4 The reference of the Interim Management Agreement as the authority on the Four Tribes Treaty fishing rights was removed from section 4.8.1.7 of the EIS. Usual and accustomed fishing places were not identified in the vicinity of the project; therefore the project is not expected to have a direct affect on the Four Tribes' fishing access. The FERC staff asked an attorney for the Nez Perce Tribe to provide the Tribe's interpretation of its fishing rights related to the Bradwood Landing Project so we could clarify the text in the EIS, but no response to this request was received back to the FERC from the Tribe.

December 21, 2007
Nez Perce Tribe Bradwood Landing DEIS Comments
Page 5 of 8

NorthernStar LLC's Salmon Enhancement Initiation Is Voluntary

NA1-5

FERC's argument concluding that the proposed project will have no adverse effect on the Tribe's Treaty-reserved fishing rights is diminished further in light of FERC's reliance on NorthernStar's Salmon Enhancement Initiative (SEI). Although the Tribe appreciates NorthernStar's initiative in proposing efforts to restore listed species in the affected area, the Tribe is reluctant, based on years of dealing with undelivered promises, to place any meaningful reliance on *voluntary* restoration initiatives. SEI, if implemented correctly, *could* be beneficial to the recovery of salmonids. The Tribe, therefore, disagrees with FERC's assertion that the SEI "would potentially contribute significantly to the conservation and recovery of salmonids (and other species) protected under the ESA." (pg. 2-242).

The DEIS discusses the SEI several times, indicating throughout the document that it would be implemented throughout the life of the project (e.g., 4-151, 4-162, 4-453), and would be "above and beyond" the usual set of mitigation measures (2-32). At the same time, however, FERC states that the SEI is voluntary (e.g., 2-32, 4-271, 5-7) but notes that the SEI is an interrelated and interdependent action (e.g., 2-28). If the SEI is indeed as integral to the project's success as FERC suggests, then the Tribe recommends that FERC require implementation and funding of the SEI as a mitigation imperative.

The United States' Trust and Consultation Responsibilities to the Nez Perce Tribe

The United States, through all of its agencies including FERC, stands in a trust or fiduciary relationship to the Tribe. This independent obligation of the United States recognizes the United States' duty to protect tribal lands, tribal resources both on-Reservation and off-Reservation, and the tribal way of life. Federal courts have held that the United States' conduct in carrying out its trust responsibility should be "judged by the most exacting fiduciary standards." *Pyramid Lake Paiute Tribe of Indians v. Morton*, 354 F. Supp. 252 (D.D.C.), *modified on other grounds*, 360 F. Supp. 669 (D.D.C. 1973), *rev'd in part on other grounds*, 499 F. 2d 1095 (D.C. Cir. 1974), *cert denied*, 420 U.S. 962 (1975). The United States' trust responsibility imposes a substantive duty to protect tribal treaty-reserved rights "and the resources on which those rights depend." *Tribes v. U.S.*, No. 96-381-HA, 1996 WL 924509, at *8 (D. Or. Oct. 2 1996). The trust responsibility also imposes an affirmative duty upon a federal agency to use its particular expertise to protect tribal resources. *U.S. v. Mitchell*, 463 U.S. 206 (1983). This substantive trust responsibility that all federal agencies owe to tribes when dealing with tribal resources, counsels in favor of conservatism when taking action with the potential to harm salmon and its habitat.

In addition to the substantive duty to prevent harm to tribal resources, the United States' trust responsibility also imposes a procedural obligation to consult with tribes on a government-to-government basis. This duty to consult is based on statute, court decisions, and executive documents such as the Presidential Memorandum of April 29, 1994 and Executive Order 13175. The Nez Perce Tribe defines consultation as the formal process of negotiation, cooperation, and

Native American Tribes

1

NA1-5

Please note that FERC is not relying on NorthernStar's SEI to make conclusions on the effect of the project on fishing rights. As described in section 4.5.2.1, additional analysis of project impacts on important fish species is being completed and will be included in the revised BA and EFH Assessment. Also, see our response to comment FA4-12.

K-380

Nez Perce Tribe Bradwood Landing DEIS Comments
Page 6 of 8

mutual decision-making between two sovereigns. Based on court decisions and the Executive Orders requiring consultation, FERC is required to engage in a dialogue with the Tribe concerning this decision during the deliberative process, before any decision is made.

Lack of Government-to-Government Consultation

NA1-6 Although members of the Nez Perce tribal leadership did attend a CRITFC meeting in or around November 2005 at which FERC staff presented information regarding the proposed project, and two interagency meetings in or around January 2006, the Tribe does not regard these limited interactions as a reasonable discharge of FERC's responsibility to engage in government-to-government consultation with the Tribe. As noted above, the Tribe defines consultation as the formal process of negotiation, cooperation and mutual decision-making between two sovereigns. The DEIS notes that the Nez Perce Tribe "expressed concerns that the project could affect fishery resources protected by tribal treaty rights." That much is correct. However, the Tribe's written response to the NOI also identifies other major concerns such as trust responsibilities, estuary degradation, dredging and fish contamination, and cultural resource protection. FERC does not acknowledge these concerns in the DEIS. The Tribe has co-management responsibility over the treaty resources within the project area, and therefore must be involved in deliberation and planning on issues that affect tribal treaty resources.

The Bureau of Indian Affairs echoed a similar concern regarding FERC's failure to consult on a government-to-government basis with tribes in its comments to the DEIS. The Tribe concurs with BIA's recommendation that FERC identify the appropriate Tribal staff liaison to receive meeting notices and information regarding the project, and be invited to meetings involving technical issues.

Impacts from Dredging Contaminated Sediment

NA1-7 The DEIS states that 700,000 cubic yards of sediment would be dredged to create the proposed ship maneuvering area in the Columbia River. The DEIS states further that "[a]lthough some contaminants were detected in samples of the material to be dredged, the concentrations were relatively low and none exceeded screening levels or threshold effects levels used to identify concentrations of concern." The Tribe remains concerned, nevertheless, that FERC did not consider the Tribe's previous request to account for tribal subsistence practices in assessing the tribal members' health risks of ingesting fish exposed to or containing contaminants. The DEIS provides no analysis or explanation addressing the potential effects of the project on Nez Perce Tribal fish consumption.

As the Tribe stated previously in response to FERC's NOI, based on the likelihood of human impacts caused by eating Columbia River salmon and steelhead, the Tribe requests that FERC use a fish consumption rate that accurately reflects actual fish consumption by Nez Perce Tribal members. A 1994 EPA funded study, "A Fish Consumption Survey of the Umatilla, Nez Perce, Yakama, and Warm Springs Tribes of the Columbia River Basin" indicates a much higher tribal fish consumption rate than what is reflected in the national average. The prevalence of

Native American Tribes

1

NA1-6 We have modified section 4.9.3 to acknowledge that the FERC has trust responsibilities to Indian tribes, as outlined in Order 635, our "Policy Statement on Consultations with Indian Tribes in Commission Proceedings," issued July 23, 2003. The EIS documents the FERC staff's consultations with the Tribe, and addresses potential impacts on cultural resources in section 4.9. The EIS also discusses project related impacts on the lower Columbia River estuary in section 4.3, and impacts on fish is also mentioned in sections 4.5 and 4.6. We address the concerns of the BIA in our responses to comment letter FA1. As an intervenor in this proceeding, the Nez Perce Tribe receives copies of all notices issued by the FERC. There are no meetings planned for the future.

NA1-7 The contaminants detected in the sediments to be dredged are very low and are generally characterized by low solubility. No measurable impact on water quality from contaminants is expected as a result of dredging and therefore, increased ingestion of contaminants by fish is highly unlikely.

K-381

December 21, 2007
Nez Perce Tribe Bradwood Landing DEIS Comments
Page 7 of 8

NA1-7
cont'd

chemical contaminants in Columbia River Basin fish (EPA PA 910/R-02-006) and the fish-centric subsistence practices of our tribal members (including our most susceptible populations of children, women of childbearing age, pregnant or nursing mothers and the elderly) creates an undue risk for cancer and non-cancer disease based on high levels of contaminants in fish and their food chain. As such, in assessing the impacts to Tribal members from contaminants being re-released by the dredging process, the Tribe requests that FERC use a fish consumption rate of *at least 65 grams/day*.

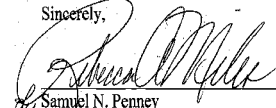

NA1-8

Moreover, there appears to be a discrepancy in the DEIS concerning concentrations within the dredge material. Under section 5.1.2 Soils and Sediments, contaminant concentrations are acknowledged, but in section 5.1.5 Wildlife and Aquatic Resources, contaminant concentrations are not acknowledged. The Tribe would like clarification regarding this discrepancy and mitigation measures addressed.

Conclusion

Thank you again for the opportunity to comment on this project. I look forward to working closely with your staff in addressing the many concerns that the Tribe has raised. I invite you to contact the Tribe to arrange a government-to-government consultation with the Nez Perce Tribe Executive Committee (NPTEC) so that our governments may initiate a dialogue regarding the proposed project. If you have any questions, please contact Michael Lopez, Nez Perce Tribe Office of Legal Counsel, at (208) 843-7355.

Sincerely,

Samuel N. Penney
Chairman

Native American Tribes

1

NA1-8

Section 5.1.2 states, "trace amounts of some contaminants were found in the sediment samples, but none exceeded threshold levels that would be considered a threat to human health or would have an adverse effect on aquatic species." Section 5.1.5 states, "sediment sampling and analysis did not detect any elevated contaminant concentrations within the proposed dredged materials and leave surface that could adversely affect aquatic species." We do not believe these statements represent a discrepancy that requires clarification.

K-383

Due to the length of the Columbia River Inter-tribal Fish Commission comment letter (comment letter NA2), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
NA2-1	The draft EIS repeatedly lists consultation and permitting procedures that must be completed, instead of reasonably evaluating and disclosing the impacts of the project as it will be implemented.	Our recommendations are used for outstanding issues that cannot be resolved prior to completing the final EIS. These include certain permits and approvals, surveys that require property access, detailed project plans, and detailed engineering specifications and plans. If the project is approved, these recommendations become conditions of the authorization.
NA2-2	The SEI is not guaranteed to be completed. Much of the habitat used for mitigation is too far distant to be "replacement" habitat as much of it is located in a different ecological zone in the estuary. The loss of mainstem rearing area will not be compensated. Why does the SEI not fall under FERC's regulatory authority? Why is the SEI program not required as part of the conditions to the license?	The adequacy of NorthernStar's proposed Compensatory Mitigation and the commentor's concerns regarding the SEI are discussed in the responses to comments FA2-10 and FA4-12, respectively.
NA2-3	It is not clear what the anticipated life of the NorthernStar Project is expected to be or whether the \$50 million is calculated in terms of today's dollars.	The life of the project is anticipated to be 40 years. The cost of the project is in today's dollars.
NA2-4	The mitigation plan that is required by regulations amounts to little more than avoidance, minimization, and reduction of impacts. The draft EIS must completely and reasonably disclose the likely impacts based on the measures taken and their limited effectiveness.	The adequacy and effectiveness of NorthernStar's Compensatory Mitigation Plan is discussed in the response to comment FA2-10. In addition, the potential impacts on federally listed species due to implementation of NorthernStar's Compensatory Mitigation Plan will be included in the revised BA and EFH Assessment.
NA2-5	No information was present to reflect the similar salinities and tidal influence as stated in the Mitigation Plan (page 44).	Since the issuance of the draft EIS, the Compensatory Mitigation Plan has been revised and no longer includes the statement referred to by the commentor. However, the baseline conditions at the Middle Svensen Island Mitigation Site are described in section 2.1.5 of the plan. See also the response to comment FA2-10.
NA2-6	In the draft EIS much of what is proposed as mitigation is already functional habitat and would likely reestablish itself by passive means. Because restoration is voluntary, there is no assurance that mitigation would actually occur according to some benefit ratio relative to the value of the current habitat that would be lost. Boundaries for the estuary are crude and inaccurate. Svensen Island is a brackish zone while the area lost is a freshwater zone. No reference to the spatial, ecological analysis of the values of habitats to be destroyed and created to determine whether all biological functions and life cycles affected are mitigated in place and kind.	See the response to comment FA3-3.
NA2-7	There should be annual mitigation requirements for the existing and proposed maintenance dredging that are not addressed in the draft EIS.	Maintenance dredging requirements would be addressed in future section 404 permits issued by the COE.
NA2-8	It is essential to have tables describing the mitigation measures that would be applied for each location and type of detrimental action.	The EIS is a summary document and based on CEQ guidelines presents a full and fair discussion of significant environmental impacts in a manner that is concise, clear, and to the point (see 40 CFR 1502.1). Where appropriate, the EIS describes the mitigation measures that would be implemented to minimize

Due to the length of the Columbia River Inter-tribal Fish Commission comment letter (comment letter NA2), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
NA2-9	All alternatives listed lack strengths and weaknesses, particularly the no action alternative. Most alternatives were discarded without full consideration required by NEPA and necessary to make a reasoned decision on this project.	potential impacts on environmental resources due to the proposed project. Therefore, we believe that the inclusion of additional tables to describe these measures is not warranted. We believe that our final EIS thoroughly examines alternatives, against the backdrop of the project's stated objectives. Please see the opening discussion in section 3.1.
NA2-10	The draft EIS analysis of dredging impacts on turbidity and suspended sediment is cursory and inadequate. The draft EIS failed to reasonably assess the likelihood and the effects of the use of other methods besides suction dredging for channel excavation.	We believe the potential direct and indirect impacts on water resources and aquatic resources as a result of dredging activities are adequately described in sections 4.3.2 and 4.5.2.1. Additional details on the extent and duration of the turbidity plume associated with dredging activities at the LNG terminal site are included in the Hydrodynamic and Sediment Transport Assessment conducted for the Bradwood Landing Project by WEST (2006). The EIS discussed the primary types of dredging in section 3.9.1.1. We agree that hydraulic cutterhead pipeline dredging is the most appropriate method for the placement sites of the LNG terminal and the Wahkiakum County Sand Pit site.
NA2-11	The draft EIS fails to note that initial and maintenance dredging will cause reduction of water surface profiles and shoreline riparian areas in and below the proposed project area. The draft EIS proposes an alternative that dumps dredge spoils back into the river. These impacts have not been thoroughly assessed.	Dredging of the berth and maneuvering area is not expected to cause significant change to water surface profiles and shoreline riparian areas. However, we have added text in section 4.1.3.3 that describes NorthernStar's Shoreline Monitoring Plan for the LNG terminal. This plan includes monitoring and proposed measures to reduce erosion of downstream banks should such erosion increase as a result of the dredging for the project. The Wahkiakum County Sand Pit site is a beach nourishment dredge material placement alternative. This site has been used previously by the COE for dredge material placement. All applicable permits and approvals would be obtained prior to use.
NA2-12	It appears highly likely that liquefaction of the loose fill at the facility site could occur and be mobilized by seismic activity.	Liquefaction would be unlikely to occur because the soils would be treated prior to construction by vibroflotation.
NA2-13	It is not clear how landslide hazards in steep terrain can be mitigated when there is a possibility of the pipeline being dislocated from a hill slope and spilling the contents into a local drainage. The Draft EIS includes no adequate analysis of the likely effects of pipeline construction and operation on sediment delivery to streams via mass failures.	Section 4.1.3.3 describes mitigation measures for unstable slopes, including avoidance and the use of HDD construction methods. Various slope stabilization and sediment control measures would be used to minimize sediment delivery to waterbodies, as detailed in the FERC staff's Plan and Procedures.
NA2-14	The potential environmental impacts from pipeline leaks caused by ground movement have not been thoroughly evaluated, nor has a means been explained to engineer the pipeline to safeguard it from rupture.	Risks to the pipeline from ground movement and mitigation are discussed in section 4.1.4.3.
NA2-15	It does not appear that any tests have been conducted on bed transportation relative to flow and bed disturbance in Clifton Channel.	Results of the Hydrodynamic and Sediment Transport Assessment conducted for the Bradwood Landing Project by WEST (2006) are discussed in section 4.2.2.2. As discussed in section 4.5.2.1, impacts on aquatic resources attributed to sediment transport and deposition may occur as a result of the

Due to the length of the Columbia River Inter-tribal Fish Commission comment letter (comment letter NA2), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
NA2-16	Dredging will greatly affect the area. Sedimentation of Clifton Channel is a significant risk and there appears to be very few protections to fish.	proposed project. Additional analysis of potential impacts on salmonids from alterations of sediment transport and deposition will be included in the revised BA and EFH assessment. As discussed in section 4.5.2.1, impacts on aquatic resources attributed to dredging and sediment transport and deposition may occur as a result of the proposed project. Additional analysis of potential impacts on salmonids from alterations of sediment transport and deposition will be included in the revised BA and EFH assessment.
NA2-17	Sediment Delivery <ul style="list-style-type: none"> The draft EIS fails to provide any credible cumulative estimate of the magnitude and persistence of sediment delivery from these multiple activities on water quality and aquatic habitat in Hunt Creek. Elevated sediment delivery from the impact of multiple activities in the Hunt Creek watershed will elevate turbidity in Hunt Creek and the Columbia River. The final EIS should clearly and fully analyze and disclose the cumulative impacts of all project activities that are likely to combine to produce adverse cumulative effects. 	With the implementation of our Procedures and NorthernStar's ESC Plans, impacts on water quality and aquatic resources in the Hunt Creek watershed and Columbia River would be less than significant; therefore, we believe that our analysis of cumulative impacts as it relates to these topics is adequate. See also the response to comment NA2-83.
NA2-18	The draft EIS does not address the possibility of contaminants being re-suspended again and again from ship traffic and maintenance dredging. Monitoring and research accomplished after additional dredging would make it impossible to measure the changes in ecological response to new dredging, as the opportunity to establish the baseline before dredging would be lost.	As discussed in section 4.2.2.2, no significant concentrations of contaminants were detected in the sediments to be dredged.
NA2-19	Decreased bank stability contributes to both stream sedimentation and channel widening. The persistent loss of bank stability associated with pipeline construction and maintenance at waterbodies will cause persistently elevated sediment delivery.	To minimize impacts on stream banks, NorthernStar would implement its Waterbody and Wetland Construction and Mitigation Procedures Plan, pipeline ESC Plan for Oregon, and SWPPP for Washington as well as our Procedures.
NA2-20	The draft EIS fails to disclose the amount, type, and proximity of land-disturbing activities within a distance to streams that will strongly and persistently contribute to elevated sediment delivery to streams. Elevated sediment delivery causes the loss of pool frequency, quality, and volume, increased width-depth ratio, elevated levels of fine sediment.	Section 4.3.2.4 describes the impacts of pipeline construction activities on waterbodies. To minimize impacts on waterbodies, NorthernStar would implement its Waterbody and Wetland Construction and Mitigation Procedures Plan, pipeline ESC Plan for Oregon, and SWPPP for Washington as well as our Procedures.
NA2-21	The draft EIS fails to note the limits of the effectiveness of mitigation measures and BMPs based on available scientific information and literature, including applicable case studies.	BMPs are generally accepted standard procedures and many are established by state or other agencies. We do not believe it is unreasonable to assume they would be effective. We have recommended in sections 4.3.2.4 and 4.4.1.2 that NorthernStar's Waterbody and Wetland Construction and Mitigation Procedures Plan and final Compensatory Mitigation Plan, respectively, be filed, along with agency approvals, with the Secretary prior to

Due to the length of the Columbia River Inter-tribal Fish Commission comment letter (comment letter NA2), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
NA2-22	It is speculative and irrelevant that the draft EIS states "...environmental inspectors could recommend restricting construction activities during unfavorable conditions (e.g., wet weather) to further reduce [soil] compaction and rutting." There is no requirement to restrict activities to limit such soil damage.	construction of the project. We do not believe that it is unreasonable to assume that agency-approved mitigation measures would be effective. Therefore, an analysis of the efficacy of the measures in the EIS is not warranted. As outlined in the FERC staff's Plan, one of the responsibilities of the environmental inspector is to advise the chief construction inspector when conditions (such as wet weather) make it advisable to restrict construction activities to avoid excessive rutting. The environmental inspector also ensures compaction testing is performed to determine the need for corrective action. We have clarified the text in section 4.2.3.1.
NA2-23	The draft EIS fails to disclose the limited effectiveness of measures to control erosion and sediment delivery to streams from pipeline construction and operation. The final EIS must provide the limits of the measures' effectiveness, disclose these limits, and factor it into an analysis of the effect of pipeline construction and maintenance on sediment delivery and its consequent impacts.	We believe the measures to control erosion and sediment delivery to waterbodies in our Plan and Procedures are effective.
NA2-24	The draft EIS fails to disclose that significantly elevated erosion in logged areas typically persists for at least 5 years.	As discussed in section 4.4.2.3, similar to scrub-shrub communities, impacts on forested communities (i.e., coniferous, deciduous, mixed, early seral, and riparian forests) would be considered long term because of the time required to restore the woody vegetation to its preconstruction condition. Impacts associated with construction and operation would be greatest on these cover types due to the change in structure and environment caused by the removal of the large tree canopy over the width of the construction right-of-way. The clearing of trees from the construction right-of-way could also affect the remaining trees along the edge of the right-of-way. Trees located on the edge of the right-of-way may be subject to mechanical damage to trunks and branches and root impacts from soil disturbance and compaction, all of which may result in the decreased health and viability of the remaining edge trees. Edge trees that were located within a dense stand of trees before construction may lack stability following removal of adjacent supporting trees, which may result in increased tree failures.
NA2-25	The draft EIS fails to adequately disclose that seed mixes that will likely be used to mitigate for wetlands, generally contain noxious weed seeds, such as cheatgrass.	We have recommended in section 4.3.2.4 that NorthernStar continue to consult with the COE, NMFS, FWS, and other appropriate federal and state agencies to finalize its Waterbody and Wetland Construction and Mitigation Procedures Plan. The final plan should include measures to prevent the spread of invasive species due to construction activities within waterbodies and wetlands and procedures for monitoring the success of the revegetation and weed control efforts.
NA2-26	The draft EIS suggests adding large woody debris into streams in an attempt to mitigate the impacts of clearing riparian areas for pipeline construction. However, information indicates that such wood additions are	We agree that the placement of LWD into streams could have temporary adverse impacts on water quality due to increased suspended sediment and turbidity levels. However, it should be noted that, as stated repeatedly in the

Due to the length of the Columbia River Inter-tribal Fish Commission comment letter (comment letter NA2), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
	often not only ineffective but also interfere with a variety of important stream processes and degrades aquatic habitat attributes.	commentor's letter and in agency correspondence, LWD is an essential fish habitat attribute and is important for both the survival and production of salmonids. Therefore, we believe that the benefits of using LWD as part of the proposed mitigation efforts outweigh any potential temporary impacts.
NA2-27	The draft EIS fails to adequately examine and disclose the impacts of detention ponds on water temperature.	As described in section 4.3.1.3, stormwater runoff from the terminal would be routed to stormwater retention ponds where it would be infiltrated to the ground and would not be released to surface waters. The retention ponds would be sized to hold runoff from a 100-year storm.
NA2-28	The draft EIS notes that construction mats will be used under heavy construction equipment operating in soft and saturated soils, but fails to disclose the degree, extent and persistence of soil compaction with these measures in place and consequent impacts on the infiltration rates, water holding capacity, runoff process, and other affected wetland functions, including the ability to absorb, store, and slowly release water. The draft EIS fails to disclose that the measure does not actually avoid water quality and aquatic habitat damage.	We believe section 4.4.1.3 adequately describes construction impacts to wetlands (temporary and permanent), restoration of wetlands, and measures taken to avoid spills in wetlands. NorthernStar is required to avoid impacts on wetlands to the maximum extent possible and must demonstrate that it has taken appropriate and practicable steps to minimize wetland impacts in compliance with the COE's section 404(b)(1) guidelines that restrict discharges of dredged and fill material where a less environmentally damaging alternative exists. This is consistent with the CEQ's Regulations for Implementing the Procedural Provisions of NEPA (40 CFR 1508.20), as further described in section 4.4.1.2.
NA2-29	Water quality effects are still an outstanding question that needs to be assessed. Water quality must be evaluated not as a river-wide average, but need to be calculated for their impacts to unique habitats. Discharges into Clifton Channel's shallow river margins and wetlands needs to be carefully analyzed. The water quality of Hunt Creek will be significantly impaired.	Within section 4.3.2.3, potential impacts on water quality are discussed for activities associated with construction and operation of the proposed project. In addition, potential impacts on unique or sensitive wildlife habitats due to construction of the LNG terminal are described in section 4.5.2.3. Therefore, we believe that potential impacts on Hunt Creek, Clifton Channel, and the mainstem of the Columbia River are discussed where appropriate. No discharges to Hunt Creek or Clifton Channel are proposed by NorthernStar.
NA2-30	The pipeline will result in many hazards, including enhancing landslide potential, increasing erosion, removing riparian cover to streams, and increasing the potential for frac-out and sedimentation. The unvegetated zone will be a constant source of sediment and stream heating.	See responses to comments IND35-7and IND106-53. Restoration of riparian areas is discussed in NorthernStar's Waterbody and Wetland Construction and Mitigation Procedures Plan. This document is available for viewing by the public on the FERC's Internet web page at www.ferc.gov , through the eLibrary link.
NA2-31	The draft EIS fails to adequately analyze the impacts of the 25-foot riparian strip which will not allow the area to revegetate with deep-rooted shrubs or trees more than 15 feet all over a 30-ft width of the center line. Studies have shown that impacts on water quality and aquatic habitats, including loss of: large wood recruitment, sediment detention from upslope sources, stream shading, and stream microclimate regulation can occur.	The EIS is a summary document; therefore, we believe that the level of detail of potential impacts on wetlands and waterbodies is appropriate. However, the revised BA and EFH Assessment will include additional analysis of potential impacts on wetlands and waterbodies, as they relate to potential impacts on federally listed species.
NA2-32	The draft EIS fails to adequately disclose the expected impacts of stormwater runoff and elevated erosion from the project with the cited measures in place.	NorthernStar has drafted a pipeline ESC Plan, and SWPPP, which are intended to meet the requirements of the respective Oregon and Washington stormwater discharge permits (see table 1.3-1 for a list of the major federal, state, and local codes, ordinances, statutes, rules, regulations, and permits

Due to the length of the Columbia River Inter-tribal Fish Commission comment letter (comment letter NA2), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
		that would apply to the project.)
NA2-33	No data is provided on the temperatures or current levels of sediment delivery from watersheds of any streams crossed by the pipeline. The draft EIS does not disclose the extent, location, and proximity of all areas that will be disturbed near waterbodies that will reduce stream shade and LWD recruitment.	All waterbodies crossed by the proposed pipeline are provided in table 4.3.2-4. Potential impacts to these waterbodies and aquatic resources are discussed in sections 4.3.2 and 4.5.3. Habitat Overlay Maps were submitted to the FERC on October 20, 2006 as part of a Supplemental Filing to Resource Report 3. This document is available for viewing by the public on the FERC's Internet web page at www.ferc.gov , through the eLibrary link.
NA2-34	The draft EIS fails to adequately assess the impacts to the area caused by water withdrawal for the water intake system.	Additional information discussing the potential impacts on water quality and aquatic resources due to water appropriations associated with construction and operation of the proposed project has been added to sections 4.3.2.3 and 4.5.2.1, respectively.
NA2-35	In streams that are already afflicted by high levels of sediment delivery and sedimentation, additional sediment delivery is likely to significantly and persistently add to existing problems. The draft EIS fails to disclose the magnitude of the effects on turbidity and suspended sediment caused by the construction of pipeline stream crossings.	Studies indicate that impacts on streams and rivers from typical pipeline construction would be temporary, and no long-term effects are expected.
NA2-36	The draft EIS does not adequately assess and disclose the impacts of stream crossings if methods other than HDD are used to cross streams. The draft EIS does not disclose the likely magnitude and frequency of frac-outs. The draft EIS fails to disclose that with frac-outs and the release drilling mud, it also will disrupt unconsolidated channel substrate, which will also generate downstream sediment delivery and turbidity. If the stream crossing method employed is HDD, the requirement to remove all riparian vegetation still exists, which will cause localized impacts to stream heating and sedimentation. The NorthernStar Mitigation Plan, for the HDD and boring methods, the stream crossings using the trenching method do not have any minimization procedures, pre-project baseline conditions, or post-project restoration conditions specified.	Non-HDD waterbody crossing techniques and potential impacts from, as well as discussion of potential frac-outs from HDDs are addressed in NorthernStar's Waterbody and Wetland Construction and Mitigation Procedures Plan, and its Attachment B, HDD Contingency Plan. This document is available for viewing by the public on the FERC's Internet web page at www.ferc.gov , through the eLibrary link. The only potential disturbance in the area between entry and exit points of the HDD would be limited to the temporary deployment of HDD guidance (telemetry) cables. Clearing would be done by hand tools, and allowed to revegetate once construction was completed. The right-of-way would not be maintained between the entry and exit points of the HDD, preserving the riparian area around the stream crossing.
NA2-37	The draft EIS fails to disclose that attempts to divert streams for construction of pipeline crossings fail with some frequency, and these failures greatly increase sediment delivery and consequent impacts on streams.	Crossing methods are determined on a site-specific basis, therefore minimizing the potential for failure. Through the implementation of the FERC staff's Procedures, NorthernStar's Waterbody and Wetland Construction and Mitigation Plan, and adherence to in-water work windows, potential impacts would be minimized.
NA2-38	It is highly probable that placement of the pipeline in the sloughs would be used in the future as justification for never restoring these lands, should they become available. The draft EIS fails to explore the critical value of these sloughs and the long-term loss to the Columbia River ecosystem's restoration by pipeline construction.	NorthernStar would restore the pipeline right-of-way to its preconstruction condition following construction. Following temporary wetland impacts resulting from construction of the proposed project facilities, habitat and ecosystem function would be restored in place. Permanent impacts on wetlands would be mitigated by restoring habitat with similar ecological function. Mitigation would occur in areas substantially larger than that lost to permanent impacts, and would be restored to a higher level of ecosystem function. No future planned restoration projects have been identified for

Due to the length of the Columbia River Inter-tribal Fish Commission comment letter (comment letter NA2), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
NA2-39	Placing the rail line within 30 feet of Hunt Creek would be a source of permanent and continuing degradation to the stream. Buffers are not sufficient as a means to reduce solar radiation and stream heating, reduce sediment delivery down-slope to the stream, or to protect the microclimate of the stream. The railroad has not been in use. Why is it being restored?	sloughs that would be crossed by the proposed project. We cannot require NorthernStar to alter its construction techniques based on speculative future projects. Section 2.1.3.6 addresses why the railroad is being restored. Discussion of the railroad realignment in section 4.3.2.3 has been updated.
NA2-40	The draft EIS fails to disclose all of the following aspects of project activities that will occur within 300 feet upslope of the Columbia River and all Hunt Creek tributaries, including intermittent channels and those that do not provide fish habitat: <ol style="list-style-type: none"> 1. The location and area of vegetation removal and soil disturbance, including soil compaction; 2. The type and amount of vegetation removed; 3. The nature and degree of soil impacts, including compaction, removal of soil cover, and alteration of soil properties 4. The distance to the nearest channel or waterbody 5. The type of activity 6. Activity duration and expected season(s) of occurrence; 7. Spatial connectivity of the nearest channel/waterbody to fish habitat and the fish populations using the habitats; 	Although we agree that potential impacts on waterbodies due to pipeline construction in upland areas should be addressed in the EIS (see sections 4.3.2.4 and 4.5.3.1), we believe that to quantify impacts within 300 feet of waterbodies would be arbitrary and capricious. The location, type, and amount of vegetation that would be disturbed due to the project are described in section 4.4.2.3 and in NorthernStar's Habitat Overlay Maps, which can be accessed through the FERC's eLibrary as described in the response to comment NA2-33. Potential impacts on soils due to pipeline construction are discussed in section 4.2.3.2. The cross-country and downstream distances to the nearest channel or waterbody from any point along the proposed route can be calculated using the Pipeline Location Maps (Appendix B). The proposed crossing method for each portion of the pipeline is shown on the Alignment Sheets for the Bradwood Landing Project, which can be accessed through the FERC's eLibrary as described in the response to comment LA3-31. Specific details regarding the duration of construction activities and season of occurrence in upland areas would be determined by the project contractor and cannot be predicted at this time.
NA2-41	The proposed LNG terminal site is located immediately adjacent to and upstream from the Julia Butler National Wildlife Refuge containing most of the remaining marshy tidelands in the estuary. This habitat is essential rearing habitat for salmon. The marsh grasses and other habitat here provide cover and food sources for these young salmon as they prepare for ocean entry.	Additional information has been added to sections 4.5.1.1 and 4.5.2.1 regarding potential impacts on unique and sensitive wildlife habitats, including the JBHNR.
NA2-42	The draft EIS does not adequately account for the current availability habitat for salmon fry and fingerlings within Reach C (NorthernStar) or Reach B (Svensen Island area) relative to historic conditions. The draft EIS does not clearly describe the effect of the project on these habitats.	A comparison of the current availability of habitat relative to historic conditions is outside the scope of the EIS. However, the revised BA and EFH Assessment will discuss potential impacts of the proposed project as they relate to the environmental baseline.

Due to the length of the Columbia River Inter-tribal Fish Commission comment letter (comment letter NA2), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
NA2-43	The draft EIS failed to disclose all important impacts associated with the construction and operation of the terminal infrastructure at the scale of the Hunt Creek watershed.	The known impacts that are described individually within section 4.5.2.1 of the EIS are not expected to result in significant cumulative impacts on the Hunt Creek watershed. The EIS is a summary document and based on CEQ guidelines presents a full and fair discussion of significant environmental impacts; therefore, we believe that our analysis of potential impacts on Hunt Creek is adequate.
NA2-44	The draft EIS does not analyze the hydrologic impacts of pipeline construction and maintenance. The draft EIS fails to disclose the total amount of soil compaction associated with pipeline activities in wetlands with 300 feet of streams. This is significant because soil compaction alters soil hydrologic processes, including infiltration, water holding capacity, surface runoff, and surface water interactions with ground water. These all influence the functionality of wetlands, because the ability of wetlands to absorb, store, and release water is one of their key ecological features.	See the response to comments IND35-7 and IND106-53.
NA2-45	The draft EIS fails to adequately disclose the magnitude, persistence, and ramifications of pipeline construction on other impacts to the hydrology of wetlands and riverine areas.	See the response to comment NA2-31.
NA2-46	No mitigation for the long-lasting effects of soils compaction in wetlands was described.	See the response to comment FA2-10.
NA2-47	The draft EIS does not reveal the riparian buffer width that would be affected, without which it is impossible to accurately determine riparian impacts. The shade values or potential recruitable LWD of riparian buffers lost are not provided.	<p>The width of the riparian buffer that would be impacted would be site-specific for each waterbody crossing. However, as described in section 4.4.2, riparian habitats that would be impacted by the project in Oregon were classified based on the Oregon Habitat Mitigation Policy. Although the State of Washington does not have a similar habitat classification system, riparian habitats have been identified by the WDFW as a priority habitat. Impacts on riparian habitats are described in section 4.4.2 and depicted in Appendix C of the final EIS.</p> <p>Because the EIS is a summary document, the inclusion of detailed descriptions of each riparian area impacted is not appropriate. However, waterbody crossings will be addressed in additional detail in NorthernStar's revised Waterbody and Wetland Construction and Mitigation Procedures Plan as well as in the revised BA and EFH Assessment.</p>
NA2-48	It is unclear what would be done to revegetate the construction areas. It is not clear that replacement of native vegetation would occur by means other than passive restoration or that tree planting would even be attempted. What is considered to be potential natural vegetation for the area?	Revegetation methods are described in detail in sections 4.4.1.3, 4.4.2.2, and 4.4.2.3.
NA2-49	The draft EIS notes that when available, certified seed would be used for revegetation of areas disturbed by pipeline construction. This indicates that this measure may not be implemented. What impacts will occur if this	We have included a recommendation in section 4.4.2.3 that NorthernStar continue to consult with the COE, FWS, NMFS, Oregon and Washington Departments of Agriculture, and other appropriate resource agencies to revise

Due to the length of the Columbia River Inter-tribal Fish Commission comment letter (comment letter NA2), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
	measure is not implemented.	its <i>Noxious Weeds and Soil-borne Plant Disease Control Plan</i> .
NA2-50	NorthernStar claims to replant more trees than the FERC requires, however no where is it mentioned what the FERC requires or how NorthernStar is exceeding those requirements. Is NorthernStar meeting the needed restoration quality of wetlands? Would it be more useful to refer to what the state considers needed and what is required to prevent environmental damage?	The FERC's revegetation requirements are described in our Plan and Procedures, which are available online at http://www.ferc.gov/industries/gas/enviro/uplndctl.pdf and http://www.ferc.gov/industries/gas/enviro/wetland.pdf , respectively. NorthernStar is proposing to replant forested communities in-kind. This would provide a higher level of mitigation than seeding, which is required by the Plan. The adequacy of NorthernStar's Compensatory Mitigation Plan is discussed in the response to comment FA2-10.
NA2-51	A longer monitoring plan is needed to assess revegetation. It is not clear that plant communities would replace what was lost in upland areas or what is considered to be the potential natural vegetation for the area. It would benefit disclosure interest to describe the minimal set of guidelines to know how far NorthernStar practices could potentially be degraded and what the consequences of this would be at sensitive sites and cumulatively.	Monitoring by NorthernStar would meet the requirements of the FERC staff's Plan and Procedures. Because the EIS is a summary document, inclusion of the Plan and Procedures would not be appropriate; however, these documents are available online as described in the response to comment FA2-51. Areas disturbed by construction activities would be restored; seeded with conservation grasses, legumes, native plant species, or other standard erosion control/cover species, where required; and allowed to naturally revegetate to preconstruction conditions, with the exception of upland forested communities which would be replanted in-kind with trees. As described in section 4.4.2.3, NorthernStar would monitor the success of revegetation efforts and employ reseeded, fertilizing, and other measures until herbaceous vegetative cover and density are similar to the adjacent areas not disturbed by construction. If there are excessive noxious weeds after the first or second growing season, an agronomist would determine the need for additional restoration measures that NorthernStar would implement, as necessary.
NA2-52	How will vegetation be kept from regrowing along the pipeline?	Per the FERC staff's Plan, NorthernStar would conduct maintenance clearing within the permanent right-of-way no more than once every 3 years.
NA2-53	The draft EIS fails to disclose the width of undisturbed vegetation on Hunt Creek. It is inadequate to maintain unimpaired riparian processes vital to water quality and fish habitat. It also fails to adequately disclose that the loss of riparian vegetation and its functions due to the railroad re-alignment measure will permanently maintain degradation of water quality and fish habitat.	Potential impacts on riparian habitat due to construction of the project are provided in table 4.4.2-1. The potential impacts on water quality within Hunt Creek and mitigation measures proposed by NorthernStar are described in section 4.3.2.3. Additional analysis of potential impacts on salmonids within Hunt Creek will be included in the revised BA and EFH Assessment.
NA2-54	Will the trees that are lost in construction of the pipeline, outside of the 15-foot riparian buffer to each side of the pipeline, be replaced?	As described in section 4.4.2.3, with the exception of the portion of the right-of-way within 15 feet of the pipeline (30 feet total), upland forested communities cleared for construction of the pipeline would be replanted in-kind with trees.
NA2-55	The EIS should include a mechanical cleaning system for the fish screens which will insure there is a back up to the air burst system or in the instance if the air burst system is overwhelmed. The draft EIS is unclear how and where LNG ship ballast, ship hull, and anchors would be treated to eliminate the threat of exotic organisms without contaminating the	As described in section 4.5.2.1, the NMFS has approved of NorthernStar's fish screen designs. Because the EIS is a summary document, specific details relating to cleaning system for the system would not be appropriate. However, the proposed water intake system will be described in additional detail in the

Due to the length of the Columbia River Inter-tribal Fish Commission comment letter (comment letter NA2), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
	Columbia River. More information must be provided on the berth-side intake system and the shop retro-fit and demonstrate that fish will not be adversely impacted by its use.	revised BA and EFH Assessment.
NA2-56	Additional erosion from ship wakes could accelerate sediment deposition downriver in rearing habitats.	See the response to comment FA4-14.
NA2-57	The draft EIS also needs to be revised to clearly define, in a quantitative sense, what is meant by its repeated use of "minimize". The draft EIS describes many significant and persistent impacts to aquatic resources as being "minimized" without any clear description.	The term "minimize," as it is used in the EIS, means to reduce or lessen potential impacts on a given resource. Quantification of the extent that each measure proposed would minimize potential impacts would be based on site specific field conditions and can not be effectively predicted at this time.
NA2-58	The draft EIS has failed to analyze the proposed project dredging impacts to temperature, and salinity, and water flow and velocity both from a short-term and long-term perspective.	See the responses to comments SA1-54 and IND100-2.
NA2-59	Although the draft EIS claims that different deep draft ships have different tendencies to strand fish, there was no information presented on the probable tendency of the LNG ships to cause such a problem.	See the response to comment FA2-19.
NA2-60	The project will pose significant and irreversible harm to anadromous fish which rear, transit and hold in the area. The project will also adversely affect habitat needed to support other treaty resources such as sturgeon and lamprey. Protection and restoration of estuarine habitat is a vital component for the recovery of 13 salmon stocks listed as threatened or endangered under the ESA as well non-ESA listed salmon stocks.	Potential impacts on non-listed and federally listed fish species due to construction and operation of the LNG terminal are discussed in sections 4.5.2.1 and 4.6.2.2. As described in section 4.6.3, the FERC would not allow construction to proceed until after we have concluded formal consultation with the FWS and NMFS.
NA2-61	Ballast and water intake is a great concern and will impact juvenile fish. There is still an open question as to whether the source of the intake will be on the berth or through the conventional method via the ship. Either choice is full of problems that were either ignored by the draft EIS or not adequately examined.	See the response to comment FA1-28.
NA2-62	The draft EIS fails to offer specific fish migratory and behavior data coupled with flow, physical and chemical habitat parameters in the vicinity of the site and within the project navigation corridor.	The papers cited in this comment (Truelove et al., 2007; Baptista et al., 2005) reference an environment and observation forecast system model which use river conditions to predict fish behavior in the estuary by linking it to behavioral observations in radio tagged fish. Sufficient behavioral data in the proposed project area is not available to make this type of analysis. Further, according to the CEQ Guidelines for the preparation of an EIS, the level of effort in addressing potential impacts from project activities should be commensurate with the expected level of impact. The cited papers do not seem to point to a level of impact on migrating fish which would warrant this level of analysis.
NA2-63	Permanent loss of essential salmon habitat at the Bradwood Landing site is known to be a planned part of the facility development. The extent of loss of associated shallow water habitats in creation of the ship berth is not well described. The habitat improvement on Svensen Island is	Potential impacts on designated critical habitat at the LNG terminal site are described in section 4.6.2.2. Section 4.5.2.1 has been revised to include a description of the potential impacts on shallow water habitat due to construction of the LNG terminal. Additional information on the Svensen Island

Due to the length of the Columbia River Inter-tribal Fish Commission comment letter (comment letter NA2), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
	unspecified. The draft EIS is deficient in its description of salmon life histories and critical habitat associated with the estuary and proposed project area and impacts.	Mitigation Sites will be included in NorthernStar's final Compensatory Mitigation Plan. The EIS is a summary document; although salmonid life history, critical habitat designations, and potential project impacts are included in sections 4.6.1.1 and 4.6.2, additional information will be included in the revised BA and EFH Assessment.
NA2-64	Dredging of a 58-acre turning basin next to the Columbia River navigation channel, frequent re-dredging of the turning basin, and filling of the log pond represent substantial impacts to estuary rearing habitats for salmon smolts and possible to spawning habitats. The use of habitats affected has not been evaluated.	Potential impacts on aquatic resources (including salmonids) due to the LNG terminal are discussed in section 4.5.2.1. See also the response to comment PM3-68.
NA2-65	The draft EIS fails to address the issue that the fall Chinook migrate and may rear in the proposed project turnaround lane that would be dredged. Chinook live in many tributaries that will be affected by the project (e.g. Westport Slough, the Clatskanie River, Abernathy Creek, Germany Creek, and the Cowlitz River. The draft EIS does not discuss habitat use by these species in the vicinity of the impact zones.	Potential occurrence of Chinook salmon in the vicinity of the LNG terminal site is described in section 4.6.2.2. Similarly, occurrence of Chinook in waterbodies impacted by pipeline construction are described in section 4.6.2.3 and in NorthernStar's Waterbody and Wetland Construction and Mitigation Procedures Plan, which is available through the FERC's eLibrary as described in the response to comment FA3-13.
NA2-66	How will Hunt Creek and Clifton Channel habitats be protected?	Impacts on aquatic habitats within Hunt Creek and Clifton Channel would be minimized through the implementation of the FERC staff's Plan and Procedures, NorthernStar's proposed mitigation measures and terminal ESC Plan, and our recommendations. In addition, NorthernStar is proposing to place the Hunt Creek Mitigation Site into a conservation easement that would be protected in perpetuity as part of its Compensatory Mitigation Plan.
NA2-67	Epidemiological studies for fish in the estuary are critical and should proceed and be included in the final EIS. The draft EIS did not consider the methodology for the study of the loss of reproductive success in Great Lakes trout due to exposure to toxic contaminants.	According to the CEQ Guidelines for the preparation of an EIS, the level of effort in addressing potential impacts from project activities should be commensurate with the expected level of impact. The assertion that bioaccumulative affects of pollutants resulting in long term effects to fish resulting from construction activity at the Bradwood site, can not be characterized with the best available science. Therefore, we believe that epidemiological or other field studies regarding bioaccumulation of toxins due to the proposed project are outside the scope of this EIS.
NA2-68	The draft EIS fails to discuss the potential efforts on Delameter Creek. The timing, nature, and location of actual measures along Delameter Creek are unspecified, not required, and uncertain to actually occur. The final EIS should clearly disclose these activities and measures.	See the response to comment FA2-10.
NA2-69	The draft EIS fails to include new field data regarding the potential impacts of the project on estuary health or fish health impacts from the proposed dredging activity or other proposed Bradwood Landing Project impacts. The draft EIS fails to offer specific fish migratory and behavior data coupled with flow, physical, and chemical habitat parameters in the vicinity	See the response to comment NA2-67.

Due to the length of the Columbia River Inter-tribal Fish Commission comment letter (comment letter NA2), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
	of the site and within the protect navigation corridor. The ecological effects of the proposed alternatives in the draft EIS are largely founded upon information and conclusions of physical modeling. The lack of field studies and data are identified as major deficiencies of the draft EIS.	
NA2-70	There is a lack of studies conducted or reviewed that would determine what effects would be caused by lighting problems during construction and operation of the terminal.	Potential impacts of terminal lighting on aquatic and terrestrial resources are discussed in sections 4.5.2.1 and 4.5.2.3, respectively. We have recommended in section 4.5.2.1 that NorthernStar continue to consult with the NMFS, FWS, ODFW, and other applicable agencies regarding its Lighting Plan. We believe that the development of the Lighting Plan in coordination with applicable agencies would identify and minimize potential impacts on sensitive species in the vicinity of the terminal.
NA2-71	The draft EIS fails to provide current conditions of the affected aquatic habitat attribute in streams that will be affected by the operation and construction of the terminal, pipeline, and transportation network, railroad re-alignment, and associated power line construction.	The EIS is a summary document; therefore, we believe that the information provided in tables 4.3.2-1, 4.3.2-2, and 4.3.2-4 adequately describes current conditions of the waterbodies impacted by the proposed project. However, a detailed description of the environmental baseline will be included in the revised BA and EFH Assessment.
NA2-72	The draft EIS fails to indicate what riparian buffer width was actually affected in pipeline corridors.	See the response to comment NA2-47.
NA2-73	The draft EIS misleads in its discussion of the impact of power line construction and maintenance, incorrectly stating that impacts on non-fish-bearing tributaries to the fish-bearing Hunt Creek are unlikely to have impacts on downstream fish habitat. The draft EIS must be revised to clearly identify all tributaries to fish-bearing streams that will be affected by project activities, and must clearly disclose that impacts to intermittent and/or non-fish-bearing streams have water quality impacts and contribute significantly to the degradation of downstream fish habitat.	Comment noted. Sections 4.3.2.3 and 4.5.2.1 have been revised to include additional information regarding potential impacts on water and aquatic resources, respectively, due to construction of the electric power line. Additional information on the waterbodies that would be crossed by the power line was filed with the FERC as part of the JPA, which can be accessed through the FERC's eLibrary as described in the response to comment PM1-4.
NA2-74	The draft EIS does not discuss how the alternatives could affect tribal socioeconomic factors or culture, and fails to assess how the proposed project will impact treaty and cultural resources. The proposed project will not benefit the protection of tribal trust resources.	The alternatives can not reasonably be studied to the same level of detail as the proposed site due to the time and cost that would be required. Our alternatives analysis focuses on the major factors that would result in the highest level of potential environmental impacts and for which data is readily available through published and public sources.
NA2-75	The proposal to construct and operate an LNG terminal in essential rearing habitat for salmonids, sturgeon and lamprey impacts treaty resources for which CRITFC was formed to protect.	Potential impacts on aquatic resources are included in section 4.5. Indian treaty fishing rights are discussed in section 4.8.1.7.
NA2-76	The draft EIS fails to address impacts from the alternatives on archaeological resources. The final EIS should contain the linkages between the fish populations, and their fate under the four alternatives and others presented in these comments with tribal cultural resources. It should also examine the issue of Environmental Justice with respect to all	See the response to comment NA2-74.

Due to the length of the Columbia River Inter-tribal Fish Commission comment letter (comment letter NA2), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
	alternatives analyzed.	
NA2-77	It is recommended that government-to-government basis be appropriated with CRITFC member tribes and become engaged in consultation with the tribes.	As discussed in section 4.9.3, the CRITFC has been included in our consultations with Native American tribes.
NA2-78	The nature of the CRITFC member tribes' treaty rights are mischaracterized (page 4-330).	Section 4.8.1.7 has been revised to provide additional discussion of the CRITFC member tribes' treaty rights.
NA2-79	Each LNG ship would maintain a Shipboard Oil Pollution Emergency Plan (SOPEP). It is not clear how carrying a plan on board would be effective in dealing with a spill or a leak. What materials are available on board that would actually assist in limiting the spill or leak? What materials would be required at the LNG terminal or at stations along the pipeline route to rapidly deal with major leaks or spills?	LNG carriers would be required to carry Coast-Guard approved vessel response plans and comply with state spill prevention and contingency plans, including the applicable requirements in Chapter 317-40 of the Washington Administrative Code – Bunkering Operations. Any materials used for leak and spill mitigation at the terminal would be detailed in the ERP.
NA2-80	The draft EIS must reasonably evaluate the efficacy of proffered mitigation measures based on available scientific information, together with the physical setting of the project's impacts, and use this to reasonably determine and disclose the direct, indirect, and cumulative impacts on aquatic and watershed resources in a clear fashion.	We have recommended in sections 4.3.2.4 and 4.4.1.2 that NorthernStar's Waterbody and Wetland Construction and Mitigation Procedures Plan and final Compensatory Mitigation Plan, respectively, be filed, along with agency approvals, with the Secretary prior to construction of the project. We do not feel that it is unreasonable to assume that agency-approved mitigation measures would be effective. Therefore, an analysis of the efficacy of the measures in the EIS is not warranted.
NA2-81	There is no cumulative effects analysis. For example, the pipeline impacts could result in cumulative sediment delivery for the multiple headwater tributary crossings that could affect sloughs and mainstream habitats.	We disagree. Cumulative effects are discussed in section 4.12 of the EIS. Cumulative impacts are defined in section 4.12 as those impacts resulting from other projects that are projects would be constructed at or close to the same time as the proposed project. In response to the example stated, with the implementation of our Procedures and NorthernStar's pipeline ESC Plan in Oregon and its SWPPP in Washington, impacts on water quality and aquatic resources in the waterbodies crossed by the proposed pipeline would be less than significant; therefore, we believe that our analysis of cumulative impacts as it relates to these topics is adequate.
NA2-82	The draft EIS lacks assessments of synergistic and cumulative impacts to salmon and critical habitat that could result from dredging.	Because dredging associated with the other projects described in table 4.12-1 is not expected to occur concurrently with either construction or maintenance dredging associated with the Bradwood Landing Project, cumulative impacts on salmonids from dredging activities are not expected.
NA2-83	The draft EIS does not meet the requirements of the NEPA with regards to the cumulative impacts analysis. 1. Catalogue past projects in the area 2. Assess the cumulative environmental impacts of those projects with the proposed project 3. Analyze the additive cumulative impact of all reasonable	We are not aware of past projects in the area of the project with similar types of impacts that would contribute significantly to cumulative environmental impacts. We interviewed representatives of local governments to determine projects that were planned in the area of the project. If projects have not been proposed and local officials are unaware of them, we do not believe they are reasonably foreseeable.

Due to the length of the Columbia River Inter-tribal Fish Commission comment letter (comment letter NA2), we have summarized the issues raised and include them in the following table along with our responses. A copy of the complete letter follows the response table.

Comment Number	Comment (Summary)	Response
	foreseeable federal and non-federal actions, whether or not they have actually been proposed.

**RE: Docket Nos. CP06-365-000 (Bradwood Landing LLC); CP06-366-000; CP06-376-000;
CP06-377-000 (NorthernStar Energy LLC).**

Dear Secretary Salas:

The Columbia River Inter-Tribal Fish Commission (CRITFC) appreciates the opportunity to provide FERC with comments on its Draft Environmental Impact Statement for the proposed Bradwood Landing LNG Project. We have reviewed the document and are attaching our general and specific comments to this letter. Likewise, we incorporate by reference comments filed by the Nez Perce Tribe as well as the Bureau of Indian Affairs (filed 9/2007). As the BIA noted, FERC has not consulted on a government-to-government basis appropriately with CRITFC member tribes on this action. We recommend that FERC engage in consultation with the tribes.

This project is substantial and complex and poses a myriad of potential negative impacts to our member tribes' treaty resources. We have attempted to address as many of our concerns as possible in the following comments, however we reserve the right to supplement our comments in the future as data gaps are filled and new information is released. Through our review of the proposed project and the DEIS, we have found that the DEIS has failed to meet the requirements of NEPA, including consideration of an adequate range of alternatives, provision of available or appropriate environmental analyses and a thorough and complete cumulative impacts analysis. Through our comments we have attempted to point out many of these specific problems. Because the DEIS fails in so many respects to fulfill the requirements of NEPA, we strongly recommend that FERC issue a Supplemental DEIS and solicit comments on this document prior to proceeding to an FEIS.

Consistent with FERC's consultation policy with tribal sovereigns, the CRITFC member tribes request a meeting with FERC staff to discuss and attempt to resolve these critical issues in the very near future.

Sincerely,

Olney Patt, Jr.
Executive Director

**CRITFC COMMENTS ON THE
BRADWOOD LANDING PROJECT
DRAFT ENVIRONMENTAL IMPACT STATEMENT**

The Columbia River Inter-Tribal Fish Commission (CRITFC) believes the construction and operation of the Bradwood LNG terminal will detrimentally and unavoidably impact important estuarine habitat, and that the construction of a gas pipeline along the Columbia River would similarly affect a great deal of habitat. We disagree with FERC's statement in its opening letter for the DEIS:

[I]f the project is constructed and operated according to applicable laws and regulations, and with implementation of NorthernStar's proposed mitigation measures, and additional measures recommended by the Agency Staffs, we believe that environmental impacts will be substantially reduced.

First, the statement is factually incorrect. The project will result in adverse impacts to the environment that will continue to exist regardless of the mitigation chosen. Mitigation simply attempts to purchase benefits, usually in another location, that may mirror the benefits lost from an activity. Based on our review of scientific materials, we believe that the project will pose significant and irreversible harm to anadromous fish which rear, transit and hold in the area. The project will also adversely affect habitat needed to support other treaty resources such as sturgeon and lamprey. Protection and restoration of estuarine habitat is a vital component for the recovery of thirteen salmon stocks listed as threatened or endangered under the Endangered Species Act (ESA), as well as other, non-ESA listed salmon stocks, *e.g.*, Pacific lamprey and sturgeon. A terminal such as this is at odds with state, federal and tribal efforts to protect and restore these estuary functions. As such, we recommend that FERC deny this permit outright.

The following comments are based on review of the Draft Environmental Impact Statement (DEIS) and salient scientific literature and information regarding the project's likely impacts on aquatic and watershed resources.¹ These comments focus on the adequacy of the analysis and disclosures in the DEIS of the project's direct, indirect, and cumulative impacts on aquatic and watershed resources. The comments describe some of the many significant defects in the DEIS that must be rectified in a Supplemental EIS and/or the final EIS in order to reasonably analyze and disclose these impacts. Due to time and space constraints, together with the manifold defects in the DEIS, these comments are not an exhaustive description and discussion of the document's many shortcomings with respect to reasonable disclosure of the project's direct, indirect, and cumulative impacts on aquatic and watershed resources. Instead, these comments describe only some of the more significant flaws in the DEIS disclosure of these impacts.

¹ In these comments, "aquatic resources" is used to denote biotic and abiotic in-channel elements and processes, including fish and macroinvertebrate populations, habitats for these populations, water quality, large woody debris, channel morphology, substrate, and streamflow, as well as the riparian processes and elements that strongly influence the condition of these aquatic resources. In these comments, "watershed resources" is used to denote processes and elements at the watershed scale that influence aquatic resources. These processes and elements include vegetation, soils, wetlands, erosion, sediment routing, surface runoff, and, groundwater-surface water interactions.

GENERAL COMMENTS

In 1977, CRITFC was formed by the four Columbia River treaty tribes: the Nez Perce Tribe, the Confederated Tribes of the Umatilla Indian Reservation, the Confederated Tribes of the Warm Springs Reservation of Oregon, and the Yakama Nation. The fish and wildlife committees of these tribes govern CRITFC. The four CRITFC member tribes have 1855 treaty rights to take fish that pass their usual and accustomed fishing places. CRITFC functions to protect, promote, and enhance the Columbia River Basin's anadromous fish resources consistent with the treaty-secured interests of its member tribes by formulating a broad, general fisheries program, and providing technical and legal support. Salmon, lamprey, sturgeon, water and other natural and cultural resources of the Columbia River Basin, including the Lower Columbia River Estuary, are critical to tribal culture, religion and economy. Consequently, CRITFCs' tribal members rely upon these resources in a manner that differs greatly from the non-tribal community.

The Bradwood Landing/NorthernStar LLCs proposal to construct and operate an LNG terminal in essential rearing habitat for salmonids, sturgeon and lamprey implicates treaty resources for which CRITFC was formed to protect. We strongly disagree with FERC's unsupported assessment that "no significant adverse impacts on Indian treaty fishing rights are anticipated as a result of the proposed project" or, even more significantly, that the project will have a "net benefit to fishery resources in the lower Columbia River." (4-330). This incredibly short-sighted notion that a large industrial development constructed right in the middle of the nursery for the most significant fish run for the tribal treaty fisheries would be beneficial is quite similar to old promises made to the tribes, such as when the U.S. Corps of Engineers promised that hatcheries would mitigate for fish lost to Bonneville Dam or that putting fish in barges and trucks would protect the fish. Today, with many fish stocks in serious decline and listed under the ESA, it is abundantly clear that these promises did not come to fruition.

Wy-Kan-Ush-Mi Wa-Kish-Wit (Spirit of the Salmon), CRITFC's guiding plan for fish recovery in the Columbia and Snake river basins, recommends: *Protect the remaining wetlands and intertidal areas in the estuary in which anadromous fish are particularly dependent.* The Bradwood site is located immediately adjacent to and upstream from the Julia Butler National Wildlife Refuge containing most of the remaining marshy tidelands in the estuary. This habitat is essential rearing habitat for salmon, including salmon that originate more than 500 miles upstream in Idaho, Oregon, and Washington. The marsh grasses and other habitat here provide cover and food sources for these young salmon as they prepare for ocean entry. This area is critical to the salmon's lifecycle and is a key component to the recovery of salmon stocks that have sustained tribal peoples for millennia. Contrary to characterizations of this project in this, and other permitting forums, this project is a large-scale development that is wholly inappropriate for the Bradwood location. The storage tanks themselves would be as tall as high-rise buildings (approximately 15 stories high) and the amount of dredging required (700,000 cubic yards) in a riverbed area considered for aquatic conservation, is immense. The ships that will visit the site two to three times each week will be the largest ships on the river to date. Their consumptive ballast water requirements are equivalent to a new large (unscreened) irrigation development. The DEIS notes that this site was formerly a mill, however, in the interim fifty (or more) years, much of the property has restored itself to be functional marsh habitat for a variety of aquatic species, including those in the mill pond which would be filled for this development.

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

It is important to note, however, that we are not opposed to the use of natural gas as a source of energy for the region. The Tribal Energy Vision (Vision) was created to “reduce the pressure of energy demand on Columbia Basin fish and wildlife resources” – in effect, to “take energy policy off the backs of salmon and the environment that supports them.” (Vision, pg. v). In addition to other recommendations, the Vision supports “strategically placed” gas-fired power generation as a part of a diversified energy portfolio for the region. Natural gas, a “bridge” fuel to seeking alternative sources energy, is still a fossil fuel, meaning it is non-renewable and has many limitations. While we support sources of energy that decrease reliance on hydropower, we are also wary of those projects that may result in more harm to aquatic wildlife which already face innumerable challenges throughout their life stages in the Columbia River. The Bradwood LNG project would not fit under the goals of the Tribal Energy Vision in that it once again supplants energy acquisition over salmon recovery.

The Lower Columbia River Estuary has been subjected to a great deal of industrial and other development over the past century which has harmed fish populations that are crucial to tribal fisheries. Recently, the Estuary, and its value to the ecology of the entire basin, has been receiving more notice and evaluations from agencies, tribes and legislators. In 2006, the Affiliated Tribes of the Northwest Indians (ATNI) and the National Congress of American Indians (NCAI) both passed resolutions opposing the Bradwood project as an inappropriate development and supporting efforts to preserve and protect the Lower Columbia River Estuary as an essential sanctuary and refuge for preserving aquatic life that is integral to tribal treaties. The Environmental Protection Agency recently listed the Columbia River as a “Great Water Body” as part of its Strategic Plan. The estuary is noted as a priority for restoration under this plan. In addition, there is a bill³ on the United States Senate’s calendar to consider studying the feasibility of naming the lower Columbia River estuary as a National Heritage Area.

In the ongoing litigation, *National Wildlife Federation v. National Marine Fisheries Service*,³ the National Marine Fisheries Service (NMFS, or NOAA Fisheries) was ordered to revisit its Biological Opinion (BiOp) on the operations of the Federal Columbia River hydropower system (FCRPS) and work with resource managers to develop a plan that would protect and recover the fish that are lost to the hydropower system (the so-called “Remand Process”). In fall of 2007, NOAA Fisheries released its 2007 draft BiOp which contains many provisions focusing on the value and importance of the estuary in the recovery of salmon. In its Supplemental Comprehensive Analysis, NOAA Fisheries notes that how ever they attempt to increase the Smolt-to-Adult Return (SAR) of fish, the success of the program depends on a variety of factors; including “biological productivity in the estuary/near shore ocean environment.” NOAA Fisheries Draft Supplemental CA, at 8-6. Throughout its analysis, NOAA Fisheries repeatedly notes that “key limiting factors” for ESA-listed salmonids include the estuary. *Id.*, at 8.2-4. Notably, for Snake River Fall Chinook, NOAA Fisheries notes that if “habitat actions” to improve quality and access are undertaken in the estuary, there is a survival benefit of approximately 9%, but that recovering estuarine habitat would result in “positive effects” that “will be long-term”. *Id.*, at 8.2-4 to 8.2-5. The BiOp pays particular attention to the dramatic changes in the estuary over the course of the last century.

Historically, the downstream half of the Columbia River estuary was a dynamic environment with multiple channels, extensive wetlands, sandbars, and shallow areas. ... Today, navigation channels have been dredged, deepened and maintained, jetties and pile-dike fields have been constructed to stabilize and concentrate flow in navigation channels, marsh and riparian

³ H.R. 401, the Columbia-Pacific National Heritage Area Study Act

³ See, e.g., *National Wildlife Federation v. National Marine Fisheries Service*, 254 F. Supp.2d 1196 (D. Or. 2003).

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

habitats have been filled and diked, and causeways have been constructed across waterways...More than 50% of the original marshes and spruce swamps in the estuary have been converted to industrial, transportation, recreational, agricultural, or urban uses. More than 3,000 acres of intertidal marsh and spruce swamps have been converted to other uses since 1948 (Lower Columbia River Estuary Program [LCREP] 1999). Many wetlands along the shore in the upper reaches of the estuary have been converted to industrial and agricultural lands after levees and dikes were constructed.

NOAA Fisheries Draft Supplemental CA, § 5.3.1, at 5-19. While several pages in the DEIS were given to explaining how the Bradwood site was a mill site fifty years ago, the DEIS gives little credence to the fact that the property has self-restored and is important viable marsh habitat. Reading the NMFS’ supplemental CA and other trends noted by other resource managers, it is clear that stepping backwards and allowing industrial development anew on this property is contrary to recovering aquatic species.

NEPA Requirements

The National Environmental Policy Act (NEPA) requires FERC staff to articulate its proposed action and then analyze the environmental impacts of and alternatives to this action. 42 U.S.C. § 4332(C). NEPA also makes clear that FERC is required to discuss in detail all appropriate alternatives to its recommended course of action. *Id.* The Council on Environmental Quality’s implementing regulations emphasize that the discussion of alternatives constitutes the “heart” of the environmental impact statement and explain that FERC is required to “rigorously explore and objectively evaluate” the environmental impacts of all reasonable alternatives. See 40 C.F.R. § 1502.14.

NEPA’s implementing regulations require that FERC present the environmental impacts of its proposed alternative and alternatives in comparative for, “thus sharply defining the issues and providing a clear basis for choice among options.” See 40 C.F.R. § 1502.14. By eliminating alternatives before truly analyzing them, FERC staff has avoided conducting a rigorous analysis of the environmental impacts and benefits of these alternatives and has failed to provide reviewers with a clear, comparative way of evaluating all options.

Furthermore, NEPA requires a cumulative impacts analysis to: (1) catalogue past projects in the area; (2) assess the cumulative environmental impacts of those projects with the proposed project; and (3) analyze the additive cumulative impact of all reasonably foreseeable Federal and non-Federal actions, whether or not they have actually been proposed. See *City of Carmel-By-The-Sea v. United States Dep’t of Transp.*, 123 F.3d 1142, 1160 (9th Cir. 1997) (rejecting cumulative impacts analysis that referred generally to other past “development projects” and did not discuss the additive impacts of foreseeable future projects); *Fritiofson v. Alexander*, 772 F.2d 1225, 1243 (5th Cir. 1985) (agency must consider reasonably foreseeable actions regardless of whether they have yet formally been proposed). NEPA requires that a cumulative impacts analysis provide “some quantified or detailed information” because “[w]ithout such information, neither courts nor the public . . . can be assured that the Forest Service provided the hard look that it is required to provide.” *Cuddy Mountain*, 137 F.3d at 1379.

This DEIS falls far short in satisfying all these requirements. Throughout the Draft Environmental Impact Statement (DEIS), FERC continuously downplays the likelihood for negative effects that this project could have on fish and wildlife. At the same time, FERC inaccurately emphasizes the positive “benefits” of the project without much substance to back its conclusions. Simply put, the facts found do not support the conclusions made.

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

While recognizing the need to assess cumulative impacts, the DEIS contains no analysis of such impacts. For example, with regard to aquatic resources, the DEIS merely lists a few factors in addition to the proposed Bradwood Project that affect the species and asserts that the effects of such additional factors is included in the baseline description of the species. A review of this section illustrates the complete lack of any meaningful cumulative impacts assessment. That section merely provides a description of the current status of some species affected by the project. In no way does it meet the requirements of NEPA to (1) catalogue past projects in the area; (2) assess the cumulative environmental impacts of those projects with the proposed project; and (3) analyze the additive cumulative impact of all reasonably foreseeable Federal and non-Federal actions, whether or not they have actually been proposed. In fact, there is no discussion of specific actions, whether past or reasonably foreseeable, as required by NEPA. Therefore, we recommend that, at a minimum, FERC require the applicant, NorthernStar to conduct further studies and gather more substantive information prior to issuing a final EIS.

Summary List of Problems with the Proposed Project

Following is a summary list of the some of the deficiencies we discovered in the DEIS as well as with the Bradwood LNG project generally. These are not comprehensive, but provide guidance to our concerns.

- Alternatives analysis is severely deficient. It lacks the strengths and weaknesses of all alternatives, particularly the no action alternative. Most alternatives were discarded without full consideration required by NEPA and necessary to the FERC to make a reasoned decision on this project.
- Mitigation is seriously inadequate, and there is no analysis of its effectiveness. In the case of the “voluntary” SEI (upon which FERC appears to rely a great deal), the mitigation is not guaranteed to be completed. In addition, much of the habitat used for mitigation is too far distant to be “replacement” habitat as much of it is located in a different ecological zone in the estuary. Also, the loss of mainstem rearing area will not be compensated.
- There is no cumulative effects analysis. One example; the pipeline impacts could result in cumulative sediment delivery for the multiple headwater tributary crossings that could affect sloughs and mainstem habitats.
- Ballast and water intake is a great concern and will impact juvenile fish. There is still an open question as to whether the source of the intake will be on the berth or through the conventional method via the ship. Either choice is full of problems that were either ignored by the DEIS or not adequately examined.
- Hunt Creek will be significantly impaired.
- Dredging (during construction and thereafter) will greatly affect the area. Sedimentation of Clifton Channel is a significant risk and there appears to be very few protections to fish.
- Water quality effects is still an outstanding question that needs to be assessed. To start, water quality must be evaluated not as a river-wide average, but need to be calculated for their

CRITFC DEIS COMMENTS

7

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

impacts to unique habitats. Discharges into Clifton Channel’s shallow river margins and wetlands needs to be carefully analyzed.

- Impacts to sloughs are significant. Change in groundwater flow, sedimentation, turbidity, increased temperature. It will result in forgoing restoring these habitats for the life of the project, rendering their potential restoration value to zero. Soil compaction will be severe and permanent. Potential for channeling flow, causing erosion.
- The pipeline will result in many hazards, including enhancing landslide potential, increasing erosion, removing riparian cover to streams, and increasing the potential for frac-out and sedimentation. The unvegetated zone will be a constant source of sediment and stream heating.

PROBLEMS WITH THE DEIS

The DEIS is devoid of substantive analysis and full of unsupported conclusory determinations. There is a serious lack of information within the actual document such that it was exceptionally difficult to review and analyze. There are several general types of recurrent defects in the DEIS that need rectification in order to reasonably disclose the project’s impacts on aquatic and watershed resources. These recurrent problems are listed below.

The DEIS has some major factual inaccuracies as well. For one, FERC mischaracterizes the nature of the CRITFC member tribes’ treaty rights:

{Pg. 4-330} Comments were received during scoping regarding potential impacts of the project on Indian treaty fishing rights. Four Indian tribes hold treaty fishing rights for ceremonial, subsistence, and commercial purposes in the Columbia River above Bonneville Dam. Although the court has approved the 2005-2007 Interim Management Agreement providing that the Treaty Tribes and the States of Oregon and Washington may agree to a fishery for the Treaty Tribes below the Bonneville Dam, no agreement has been negotiated that would authorize Indian treaty fishing in the area adjacent to the proposed site. No Indian treaty fishing sites have been identified along the waterway for LNG marine traffic. However, salmon migrating to and from sites above Bonneville Dam could be affected by the passage of LNG ships during operation of the proposed project. As discussed in section 4.5.1.1, NorthernStar would avoid, minimize, reduce, rectify, and compensate for impacts on fishery resources during construction and operation of the project. Therefore, no significant adverse impacts on Indian treaty fishing rights are anticipated as a result of the proposed project. In fact, implementation of NorthernStar’s SEI is expected to result in a net benefit to fishery resources on the lower Columbia River.

As we noted above, we do not agree with FERC that there will be no significant adverse impact to fishery resources and more important, no impact to tribal treaty fishing rights. Furthermore, it is important to note that the four CRITFC member tribes hold “the right to take fish at all usual and accustomed fishing places” through their respective treaties. This right has been affirmed by a long line of court precedent. In the case, *United States v. Oregon*, the court stipulated that each tribe held at least one usual and accustomed fishing place in river Zone 6, i.e., the mainstem Columbia River from Bonneville to McNary dams. However, this stipulation does not define the geographical extent of any of the tribes’ usual and accustomed fishing places, nor does any subsequent agreement. We recommend that FERC correct this paragraph.

Data Deficiency in Model Predictions

The ecological effects of the proposed alternatives in the DEIS are largely founded upon information and conclusions of physical modeling. The lack of field studies and data are identified as

CRITFC DEIS COMMENTS

8

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

major deficiencies of the DEIS. Despite the fact that physical models were constructed, no new field studies or data were produced for the DEIS. Other than some cursory sediment sampling, the DEIS fails to include new field data regarding the potential impacts of the project on estuary health or fish health impacts from the proposed dredging activity or other proposed Bradwood LNG impacts. The DEIS fails to offer specific fish migratory and behavior data coupled with flow, physical and chemical habitat parameters in the vicinity of the site and within the project navigation corridor, even though such an approach is available (Truelove et al. 2007; Baptista et al 2005). McComas et al. (2007) have begun juvenile salmon acoustic telemetry work and habitat assessment work from Cathlamet Bay to Tenasillahe Island which covers the proposed LNG site. Further, there is only limited information in the DEIS regarding ship wake impacts on EFH.

ESA: Lack of Analysis of Impact to Listed Species

The DEIS describes some potential impacts to 13 ESUs of Columbia and Snake River salmon, but fails to mention or list, much less address, proposed project impacts to other non-listed salmon and other fish species. Mid-Columbia summer Chinook, Mid-Columbia Sockeye, Mid-Columbia coho, Deschutes River fall Chinook and the last great North American wild stock of fall Chinook that originates in the Hanford Reach all depend upon critical habitat, including the Columbia River Estuary, and all pass through and may directly utilize the proposed project site. In addition, Pacific lamprey that are severely depressed and Columbia River white sturgeon migrate and may rear in the proposed site. These are all treaty trust resources of CRITFC's member tribes.

Tribal Socio-Economic Resources

The DEIS does not discuss how the alternatives could affect tribal socioeconomic factors or culture, and fails to assess how the proposed project will impact treaty and cultural resources. The FEIS should analyze the continuing and cumulative impacts of the DEIS alternatives to the socioeconomic factors for tribal communities using methods and data described in Meyer Resources (in CHM2Hill 1999). The Meyer Resources analysis describes the transfer of river wealth from tribal communities to non-tribal communities from actions such as dredging for navigation. Loss of tribal wealth with respect to loss of fish and wildlife resources from the river has resulted in disproportionate rates of poverty and mortality to tribal communities compared to non-tribal communities.

With respect to tribal cultural resources, the DEIS fails to address impacts from the alternatives to archaeological resources. The health and abundance of anadromous fish, including salmon, steelhead, Pacific lamprey and sturgeon are also critical tribal cultural resources and have been since time immemorial. The FERC has not consulted with the tribes about impacts to cultural resources from the proposed alternatives. The FEIS should contain the linkages between these fish populations, and their fate under the four alternatives and others presented in these comments with tribal cultural resources. The FEIS must examine the issue of Environmental Justice with respect to all alternatives analyzed. The proposed project will not benefit the recovery of Columbia Basin fish populations or protection of tribal trust resources.

Mitigation Options

The mitigation plan that is required by regulations amounts to little more than avoidance, minimization, and reduction of impacts. This type of mitigation, as described, is highly discretionary in its consideration of what impacts are actually avoidable. Some aspects that are available (e.g., suspension of work during adverse weather) are not even required but merely suggested. Impacts are

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

disclosed only in the most qualitative manner (e.g., riparian vegetation removal is apt to result in increases in water temperature and avoidance of some of the impact could be facilitated by minimizing riparian loss to the extent possible). Quantitative impact analysis was not conducted, nor was a cumulative evaluation of impact at a basin scale, where a basin is the habitat unit supporting populations of listed or sensitive species.

• **Salmon Enhancement Initiative (SEI)**

We are encouraged by NorthernStar's "Salmon Enhancement Initiative" (SEI) as a step in the right direction. We would like to see more private industry step up and contribute for their respective impacts on aquatic resources in the region. But we are also troubled by the grand predictions made by both the applicant and FERC of the results of this program which we know to be overly optimistic and unrealistic. The SEI, if implemented correctly, *could* be beneficial to the recovery of salmonids. However, we disagree with FERC's assertion that it "would potentially contribute significantly to the conservation and recovery of salmonids (and other species) protected under the ESA." (pg. 2-242).

The SEI is addressed *no less* than eleven times in the DEIS, and its proposed composition and processes given several pages of discussion. FERC continually refers to the SEI as something that will be implemented throughout the life of the project, (e.g., 4-151, 4-162, 4-453), and would be "above and beyond" the usual set of mitigation measures (2-32). Yet FERC emphasizes that the initiative is merely voluntary (e.g., 2-32, 4-271, 5-7) while noting that the SEI is an interrelated and interdependent action (e.g., 2-28). First, it is not entirely clear why the SEI does not fall under FERC's regulatory authority; and second, why, if FERC intends to give it so much credence, doesn't FERC require the SEI program as part of FERC's conditions to the license?

If FERC is using this program to demonstrate that the LNG project will adequately mitigate for its impacts to fish, then it is inconceivable why FERC claims it has no jurisdiction over the program. On the other hand, if FERC does not, in fact, have jurisdiction, then the DEIS should not include the benefits of this mitigation within the framework of analyzing the LNG project. There is virtually no assurance anywhere that SEI will be implemented once FERC issues the license. If the license is transferred to a third party to take control of construction and/or operations, again, without the SEI as part of conditions of licensure, there is zero assurance that the provisions of the initiative will be respected. Indeed, in the applicant's IPO filing with the SEC, there is no mention of the SEI as a commitment or a liability, whereas other (smaller) donations to other organizations were listed. We recommend that FERC address the SEI as either a required condition of the license, or remove the SEI from consideration as a certain-to-occur mitigation for the project's damages.

• **Limits of Effectiveness of Mitigation Measures Relative to "Minimization" of Impacts**

The DEIS fails to take a hard look at the limits of the effectiveness of mitigation measures and BMPs based on available scientific information and literature, including applicable case studies. Instead of reasonably considering the limits of mitigation and BMP effectiveness, the DEIS makes sweeping, arbitrary assumptions about the impacts of activities in the complete absence of a hard look at the limited efficacy of mitigation measures. This recurrent defect precludes reasonable disclosure of the project's impacts and ignores the best available scientific information.

This type of defect occurs throughout the DEIS in its discussions of many aspects of the project's impacts on aquatic and watershed resources. For instance, in discussing the significant impacts of heavy machinery and construction on wetland soils, the DEIS merely describes measures

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

that might be taken to somewhat limit soil damage (compaction, disruption, loss of infiltration rates, and water-holding capacity) relative to what would occur in the absence of these measures, but without any disclosure of the degree, extent, and persistence of soil damage that will occur to soils with these measures in place. As a specific example, the DEIS notes (p. 4-46) that construction mats will be used under heavy construction equipment operating in soft and saturated soils, but fails to disclose the degree, extent and persistence of soil compaction with these measures in place and consequent impacts on the infiltration rates, water holding capacity, runoff process, and other affected wetland functions, including the ability to absorb, store, and slowly release water. In this specific example, the arbitrary approach thoroughly precludes reasonable impact disclosure because wetland soils will still be compacted under machinery operating over mats, resulting in direct, indirect, and cumulative impacts on wetland functions that are not reasonably disclosed in the DEIS. In this specific instance, the DEIS also fails to reasonably disclose that wetland impacts from widespread soil compaction are extremely persistent, usually requiring more than 50 years for complete recovery.

In discussions of the impacts of pipeline construction and operation of streams, the DEIS repeatedly asserts (e.g., p. 4-168) that "... to **avoid impacts on aquatic habitat water quality (sic)**..." a riparian strip with a width of at least 25 feet from the mean high water mark would be allowed to revegetate after construction, although not with deep-rooted shrubs or trees more than 15 feet tall over a 30-ft width centered over the pipeline. However, the DEIS utterly fails to disclose that a legion of studies have documented that this is inadequate to avoid impacts to water quality and aquatic habitats, and, instead creates many significant negative impacts on water quality and aquatic habitats, including loss of: large wood recruitment, sediment detention from upslope sources, stream shading, stream microclimate regulation (e.g., Rhodes et al., 1994; CWWR, 1996; USFS et al., 1993). In this specific example, the DEIS fails to reasonably disclose impacts and the limited effectiveness of a purported mitigation measure. The DEIS fails to reasonably disclose that the measure does not actually avoid water quality and aquatic habitat damage, but instead perpetuates it.

Another example is that the DEIS repeatedly and baselessly asserts that measures to manage stormwater runoff and erosion from project activities will "minimize" project impacts. However, these assessments are made without any hard look at the effectiveness of the cited measures, based on available scientific information. These assertions are also made without any clear definition as to what the DEIS deems to be a "minimized" impact. There is abundant scientific information that such measures do not eliminate the significant and numerous impacts associated with the project, which the DEIS completely fails to factor into its analysis. In so doing, the DEIS fails to adequately disclose the expected impacts of stormwater runoff and elevated erosion from the project with the cited measures in place, based on thorough analysis of available scientific information on the limits of the effectiveness of proposed measures. The DEIS cannot merely cite measures together with an unsupported assessment that they will effectively "minimize" impacts to a wholly undefined degree. Instead, it must take a hard look at available scientific information related to the impacts of the project with cited measures in place.

In this vein, the DEIS also needs to be revised to clearly define, in a quantitative sense, what is meant by its repeated use of "minimize." This is warranted because the DEIS currently describes many significant and persistent impacts to aquatic resources as being "minimized," without any clear description of the criteria used to determine what constitutes a "minimized" impact.

This type of defect is repeated throughout the DEIS and is not relegated to the previous examples. The DEIS uses this same flawed approach regarding numerous impacts, including chemical spills, wetland damage and destruction, noxious weed spread, deposition of dredge spoils, and, erosion

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

and sedimentation from the construction and operation of the terminal, pipeline, power line, and railroad re-alignment.

These flaws in the DEIS must be rectified by reasonably evaluating the efficacy of proffered mitigation measures based on available scientific information, together with the physical setting of the project's impacts, and using this to reasonably determine and disclose the direct, indirect, and cumulative impacts on aquatic and watershed resources in a clear fashion. In order to remedy this problem in the DEIS, in all cases where the FEIS discusses its assessment of the efficacy of measures to ameliorate impacts, it must thoroughly disclose the scientific basis for that assessment. The FEIS must also disclose scientific information that supports a conclusion that is contrary to those made in the FEIS regarding the effectiveness of measures aimed at limiting impacts. Absent such rectification, the assessments of the effectiveness of mitigation measures and resulting impacts are arbitrary, baseless, and inadequate for impact disclosure.

• Listing of Mitigation Measures is Not Analysis of Impact and Effectiveness

In many of the discussions of the project's impacts, the DEIS repeatedly merely lists mitigation measures and plans aimed at addressing impacts, instead of analyzing and disclosing the impacts on aquatic and watershed resources with the listed measures and plans in place. This is not adequate for reasonable disclosure of impacts because the magnitude, extent, intensity, and persistence of impacts to aquatic and watershed resources that still accrue are not disclosed. Examples of defects of this ilk occur with great regularity throughout the document. But a few examples of this common flaw include discussions of the impacts from wetland damage and destruction, mitigation of permanent destruction of wetlands, revegetation measures, noxious weed spread, and water quality impacts.

The DEIS must do more than repeatedly list measures that will be taken in effort to somewhat ameliorate impacts; it must completely and reasonably disclose the likely impacts based on the measures taken and their limited effectiveness based on taking a hard look at the available scientific literature related to these issues. Merely listing project measures is not a credible surrogate for taking a hard look at the likely impacts of the project and disclosing them as required in an EIS.

• Impacts Associated with Mitigation

The DEIS fails to reasonably evaluate and disclose the likelihood and significance of negative collateral impacts from proposed mitigation measures. For instance, the DEIS suggests adding large woody debris to streams in an attempt to mitigate the impacts of clearing riparian areas for pipeline construction. However, the DEIS fails to take a hard look at available information that indicates that such wood additions are often not only ineffective but also interfere with a variety of important stream processes and degrade aquatic habitat attributes (Beschta et al., 2004).⁴

As another example of the DEIS's failure to examine collateral damage, the DEIS suggests (p. 4-96) that vegetation seeding in areas proposed as mitigation for wetland destruction would use seed mixes that "... would be certified weed free..." However, the DEIS fails to adequately disclose that

⁴ The DEIS completely fails to reasonably disclose that Beschta et al. (2004) also expressly noted that it should not be assumed that the addition of instream wood mitigates the negative effects of management practices that accelerate sediment delivery to streams. Although inadequately disclosed in the DEIS, pipeline construction and operation will persistently and significantly elevate sediment delivery to streams. This is one of the many examples where the DEIS failed to examine and disclose available scientific information that indicates that proposed mitigation measures are likely to be ineffective.

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

despite certification, such seed mixes often contains noxious weed seeds, such as cheatgrass (Karr et al., 2004).

Stormwater detention ponds, which are proposed to reduce erosion and runoff from the terminal construction site, will cause stored water to be heated during the summer months, contributing to increases in downstream water temperature. However, the DEIS fails to adequately examine and disclose the impacts of detention ponds on water temperature. Similarly, the project will introduce a concrete berm during the construction period. Studies have documented that such runoff from impermeable areas, such as the berm, is considerably warmed during critical summer months, increasing water temperatures in receiving streams (USGAO, 1990). However, the DEIS includes no adequate analysis of the impact of this stormwater management measure on water temperatures.

The DEIS also fails to reasonably disclose that attempts to actively restore systems often fail, these efforts can also set back restoration and cause additional ecosystem damage that sets back ecosystem restoration (Kaufman et al., 1997). The DEIS needs to remedy this general defect by reasonably examining and disclosing the potential of mitigation measures to exacerbate, rather than ameliorate impacts, based on a thorough analysis of available scientific literature and information.

• FERC Lists its Recommended Refinements in Actions but Impacts are Not Analyzed

Instead of reasonably evaluating and disclosing the impacts of the project as it will be implemented, the DEIS repeatedly suggests the development of additional measures and refinements for numerous aspects of the project, including those that will affect aquatic and watershed resources by damaging and destroying wetlands, and creating levels of noise that injure fish. This is obviously inadequate. Reasonable analysis and disclosure of project impacts require analyzing the impacts of the project as it will be implemented. Recommending refinements is not a surrogate for such analysis.

If FERC believes there will be substantive changes in impacts in response to its recommendations, then it must not issue the EIS until its recommendations have been met, analyzed for their impacts, and thoroughly disclosed. It is not reasonable for FERC to make assumptions about the efficacy of its recommendations until they have been fully addressed, formalized as part of project requirements, and evaluated in detail. The recommendations for project refinements are not salient to impact analysis until a response has been finalized, made mandatory, and analyzed.

• Permanent Losses, Uncertain Gains

Permanent loss of essential salmon habitat at the Bradford Landing site is known to be a planned part of the facility development. The extent of loss of associated shallow water habitats in creation of the ship berth is not well described. The frequent dredging of the 52-acre turning basin combined with the propeller wash will ensure that this habitat will be first degraded and then never allowed to recolonize to the extent that it will be functional habitat.

The DEIS suggests that permanent habitat loss at the facility site be exchanged for future, but unspecified, habitat improvement on Svensen Island. Much of what is proposed as mitigation is already functional habitat and would likely reestablish itself by passive means. Other habitat would undergo restoration via passive means if dikes were removed. Because restoration is voluntary, there is no assurance that mitigation would actually occur according to some benefit ratio relative to the value of the current habitat that would be lost. In addition, the location of the Svensen Island is miles downriver in Reach B. Svensen Island is located in the estuary mixing zone, while the habitat to be

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

impaired and lost near the LNG facility is in Reach C (generally a freshwater rearing zone). These ecological types are different, so it is not clear that brackish water rearing areas to be produced in a mitigation program would be an equal exchange for freshwater habitats lost. In fact, there has been no spatial, ecological analysis of the values of habitats to be destroyed and created to determine whether all biological functions and life cycles affected are mitigated in place and kind.

p. 2-32. *NorthernStar proposes to implement an SEI to contribute to the recovery of salmon and the lower Columbia River ecosystem. The SEI would be entirely voluntary and would be above and beyond the mitigation measures used to avoid, minimize, rectify, reduce, and/or compensate for environmental impacts that are required by the regulations. NorthernStar's SEI would entail providing funding for salmon preservation, enhancement, and restoration projects on the lower Columbia River that would likely total more than \$50 million over the life of the Bradford Landing Project. The National Fish and Wildlife Foundation's Western Partnership Office in Portland, Oregon would serve as the fiscal agent for SEI funds. The long-term implementation of this voluntary SEI is outside of FERC's regulatory authority.*

The basic mitigation measures are simply to avoid or reduce impacts, probably to the extent considered feasible. The voluntary nature of mitigation measures that could be considered as compensation for known, planned damage to the Columbia River environment is unacceptable. It is not clear what the anticipated life of the Bradford Landing Project is expected to be or whether the \$50 million is calculated in terms of today's dollars. Loss of habitat to the facility will be permanent and may not be truly compensated if all cumulative effects were to be accounted.

p. 43. *NorthernStar Mitigation Plan (Aug. 1, 2007). The driving factor in selecting a site for restoration was the ability of a given site to replace estuarine functions that would be lost at the Terminal. An estuarine functions assessment of the impact site (URS 2006b) determined that providing rearing habitat for anadromous fish species (ESA-listed Chinook, coho, and chum salmon in particular) was one of the most important functions provided by the impact site. To this end, the mitigation site selection process placed finding sites with the opportunity to restore fish habitat as the highest priority.*

p. 44. *NorthernStar Mitigation Plan (Aug. 1, 2007). The middle Svensen Island site met all the search criteria and was deemed suitable for replacing estuarine habitat in Oregon. The site is located 14 river miles west of the Terminal impact site within the portion of the Columbia River designated as estuarine by the Department of State Lands (DSL). Salinity and tidal influence are similar at both the impact and mitigation sites, and both are within the lower Columbia River watershed.*

Although it was apparently the intent was to find mitigation opportunities that matched the salmon rearing environments being destroyed in building the terminal, the classification of these estuarine habitats would argue against this being the case. No information was presented to reflect the similar salinities and tidal influence.

p. 44. *NorthernStar Mitigation Plan (Aug. 1, 2007). In addition, preservation of the estuarine wetland adjacent to the Terminal at the confluence of Hunt Creek and Clifton Channel will protect and maintain high-value estuarine wetland habitat. This site serves the same ESA-listed salmon as the Terminal impact site.*

It is not clear how the Hunt Creek and Clifton Channel high-value habitats will actually be protected, despite the statement that they will be protected. It appears to be far more likely that with high levels of terminal activity, continued dredging, and prop wash of bottom sediments, that there will be persistent sedimentation of these habitats.

Some parts of the estuary (e.g. the Clifton channel off the northern tip of Tenasillahe Island) show relatively larger amplitude currents than at surrounding grid points, thus these regions may be subject to increased erosion and sediment transport due increased bottom stresses and dispersion due to large horizontal velocity shears. (CREST 1984).

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

The potential for increased rates of erosion in the Clifton Channel (CREST 1984), combined with the proposed terminal and the inherently high fishery potential for Clifton Channel, make activities in this area biological hazardous. Among a number of Columbia River estuary habitats sampled in a test fishery, the Clifton Channel had among the highest catch rates for Chinook, steelhead, shad, and sturgeon (Hirose et al. 1998). There have also been more recent surveys by NOAA research staff in upper Clifton Channel and other locations throughout the estuary of the use of key habitats by juvenile salmon. Bottom (2006) reported that in this sampling network, peak Chinook catches were broadly distributed from February through July, while abundances of chum and coho were spatially and temporally restricted. Chum occurred mostly from February to May. The FEIS contains only the most general life history and habitat use information. No data or studies were presented on the estuary habitats most likely to be affected. No information was provided on the spawning or rearing use of the Clifton Channel, the mainstem Columbia, the sloughs, mouth of Hunt Creek, Tenasillake Island, or Puget Island. This represents a serious data gap, making all estimates of impact ambiguous.

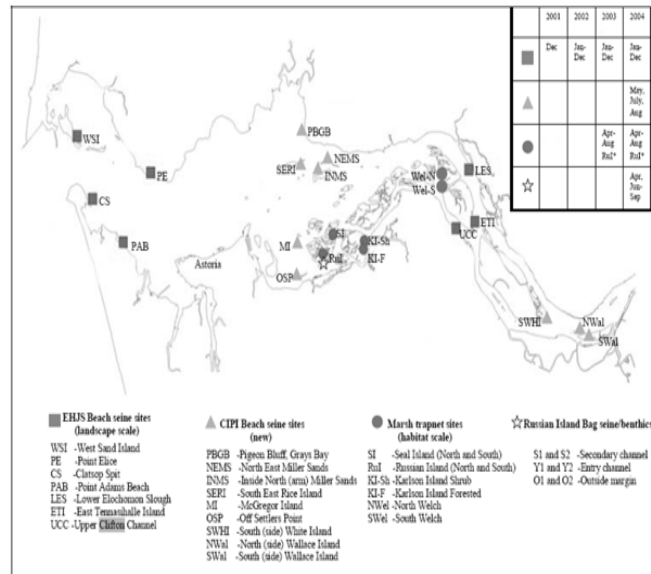

Figure 0. NOAA Fisheries monitoring project sampling locations. (EHJS=Estuarine Habitats for Juvenile Salmon, CIPI=Channel Improvement Project Investigation). LCREP (2004).

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

• Significant Uncertainties in Plans Cannot be Ignored in a NEPA Disclosure Document and Deferred to Future Planning

The Bradford LNG plans are filled with uncertainties concerning plans and environmental effects. Any project with likely environmental impacts would undoubtedly involve a level of uncertainty in its full impact. However, the LNG DEIS tends to offer little more than the most general types of environmental disclosure. For example, see the following:

p. 4-84. *The impacts of the open-cut construction method on the minor intermittent and perennial streams along the pipeline routes would generally be localized and short term. Clearing, grading, and trenching within and adjacent to these streams would have the greatest effect on water quality. Clearing of trees and vegetation in and around streams could lead to an increase in water temperature. Sediments would be resuspended by in-stream construction activities or by erosion of cleared stream banks and riparian areas. Turbidity resulting from the resuspended sediments could reduce light penetration and the corresponding photosynthetic oxygen production. Resuspension of deposited organic material and inorganic sediments could cause an increase in consumption of biological and chemical oxygen, decreasing available dissolved oxygen.*

p. 4-84. *Clearing and grading of streambanks, in-stream trenching, backfilling, and trench dewatering could affect surface water quality through increased sedimentation, increased turbidity, decreased dissolved oxygen concentrations, and stream warming.*

Impacts will generally be localized and short term, of course, unless they are widespread and long term. To say that clearing trees from riparian areas could lead to an increase in water temperature is certainly an understatement. It also does not resolve at all what the level of impact is. If the impact is relatively small, one would need to know what this really means. No data are ever given on the temperatures or current levels of sediment delivery from watersheds of any streams crossed by the pipeline. Without such information, the generalities offered are not of use in estimating the local or cumulative effects of all actions proposed in the pipeline. It is obvious that turbidity could result from suspension of sediments, both from dredging and ship wakes, and from pipeline corridors and construction.

• Reference to Miscellaneous External Documents that Could Govern Mitigation but which are Undecided

The DEIS alludes to external plans that represent some kind of melding of FERC guidelines, proposed NorthernStar impact reduction plans, and state requirements. See quotations below for a significant cross-section of the references to ESC plans, SWPPP Plans, FERC procedures, JPA, and JARPA plans. Given the large volume of the DEIS, it is essential to have tables describing the mitigation measures that would be applied for each location and type of detrimental action. It is not feasible to sift through 350 Mb of miscellaneous reports posted on the FERC website to attempt to piece together the mitigation that is assured and which is merely recommended but optional. It appears that none of this is at all reasonably certain to occur, given that final mitigation would only be decided after a contractor is selected. It is not clear why selection of a contractor has anything to do with measures needed to protect the environment. If a contractor is incompetent, this should be no excuse for downgrading the measures required.

p. ES-3. *Potential impacts on soils, wetlands, and water resources would also be minimized through measures specified in NorthernStar's Erosion and Sediment Control (ESC) Plans and Stormwater Pollution Prevention Plan (SWPPP), and the FERC's Wetland and Waterbody Construction and Mitigation Procedures (FERC's Procedures).*

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

p. ES-8. *NorthernStar would implement its project-specific ESC Plans and a SWPPP, and follow the FERC Procedures to mitigate impacts on soils, wetlands, and water resources;*

p. 2-39. *NorthernStar has also drafted an Erosion and Sediment Control Plan for Oregon – Bradwood Landing Pipeline (pipeline ESC Plan) and a Construction Stormwater Pollution Prevention Plan for Washington – Bradwood Landing Pipeline (SWPPP).² These plans incorporate elements of the FERC's Plan and Procedures, state and county requirements and provisions, stormwater pollution prevention plans, and spill prevention and response procedures. Drafts of these plans were included in NorthernStar's JPA and JARPA. The pipeline ESC Plan and SWPPP are discussed further in section 4.2.3.2.*

p. 2-39. *NorthernStar included its terminal ESC Plan and pipeline ESC Plan as part of its JPA, and included its SWPPP as part of its JARPA. NorthernStar's JARPA was filed with the FERC on November 6, 2006, and supplemented with a filing on November 22, 2006. NorthernStar also filed its JPA on November 22, 2006, and filed revisions to the JPA with the FERC on April 5, 2007. These documents are available for viewing by the public on the FERC's Internet web page at www.ferc.gov, through the eLibrary link, selecting "General Search," entering the docket number minus the last three digits (i.e., CP06-365), and putting in the proper date range. The FERC's Plan and Procedures are also available to the public on the FERC's Internet web page by clicking on Industries, Gas, Environment, Guidelines.*

p. 2-48. *The restored construction right-of-way would be revegetated in accordance with NorthernStar's pipeline ESC Plan for Oregon and SWPPP for Washington, FERC staff's Plan, other permit requirements, and site-specific landowner requests.*

p. 4-44. *NorthernStar would use prescribed erosion control devices (e.g., silt fence, hay bales) and construction practices as specified in its pipeline ESC Plan for Oregon and SWPPP for Washington to minimize erosion during and after construction activities (see section 2.4).*

p. 4-45. *NorthernStar would minimize impacts on prime farmland by constructing the pipelines in accordance with its ESC Plan and SWPPP.*

p. 4-45. *NorthernStar would minimize rutting of hydric soils by using construction mats where hydric soils cannot support equipment and/or by employing low-ground-weight equipment according to its ESC Plan and SWPPP and our Procedures.*

p. 4-46. *NorthernStar would minimize compaction and rutting impacts by using measures outlined in its pipeline ESC Plan and SWPPP and our Procedures (e.g., construction from timber mats, or low-ground-weight equipment) during construction in soft or saturated soils.*

p. 4-48. *NorthernStar's pipeline ESC Plan and SWPPP incorporate elements of the FERC's Plan and Procedures, state and county regulations and provisions, stormwater pollution prevention plans, and spill prevention and response procedures. Drafts of these plans were included in NorthernStar's JPA and JARPA. Final versions of these plans would be developed after a construction contractor has been selected prior to construction. We have reviewed NorthernStar's pipeline ESC Plan and its SWPPP and find that in many cases they lack specific procedures, and are less detailed than or do not provide equivalent or greater protections to the environment compared to our Plan. On the other hand, the pipeline ESC Plan and SWPPP contain BMPs and mitigation measures for items outside the scope of our Plan, such as spills prevention and cleanup, wind erosion and dust control, and project-specific seasonal work restrictions. To ensure that potential impacts on soils as well as vegetation are effectively minimized, we recommend that:*

• *NorthernStar should conduct a comparative analysis of the FERC's Plan and its pipeline ESC Plan and SWPPP to demonstrate that NorthernStar's plans provide equal or greater protections to the environment. If the analysis determines that specific aspects of NorthernStar's plans do not provide equal or greater protections, NorthernStar should revise its plans to include the measures from the FERC's Plan or should provide proposed alternative measures that would provide equal or greater protections. The results of the comparative analysis and NorthernStar's revised plans (if applicable) should be filed with the Secretary for the review and written approval of the Director of OEP prior to the end of the draft EIS comment period.*

p. 4-86. *To reduce impacts on vegetation within the construction and permanent rights-of-way and improve revegetation potential for open-cut waterbody crossings, NorthernStar would implement its SWPPP in*

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

Washington. Following construction, all work areas would be restored, seeded with conservation grasses, legumes, native plant species, or other standard erosion control/cover species, where required, and allowed to naturally revegetate to preconstruction conditions.

p. 4-116. *To reduce impacts on riparian vegetation within the construction and permanent rights-of-way, NorthernStar would implement the measures included in its pipeline ESC Plan and SWPPP, as well as utilize the HDD or bore methods at 19 waterbody crossings (see section 4.3.2.4). NorthernStar would reduce the size of waterbody crossing staging areas and place these staging areas at least 50 feet from the water's edge whenever topographic conditions permit. Additionally, NorthernStar would allow a riparian buffer at least 25 feet wide, as measured from the waterbody's MHHW mark, to permanently revegetate with native woody plant species across the entire right-of-way; however trees greater than 15 feet tall, or deeprooted shrubs that could damage the pipeline's protective coating, obscure periodic surveillance, or interfere with potential repairs, would not be allowed to grow within 15 feet (30 feet total) of the pipeline.*

The procedures in the SWPPP are not specified so it is unclear what would really be done to revegetate construction areas. It also appears that revegetation will typically be only via scattering of grass seed to control erosion. It is not clear that replacement of native vegetation would occur by means other than passive restoration or that tree planting would even be attempted.

• Estuary Habitat and Mitigation: Loss of Estuary Habitat

Dredging of a 58 acre turning basin next to the Columbia River navigation channel in the vicinity of Bradwood, frequent (every 2-4 years) re-dredging of the turning basin, filling of the log pond that is connected by channel to the Columbia, represent substantial impacts to estuary rearing habitats for salmon smolts and possibly to spawning habitats. The use of habitats affected has not been evaluated..

The Bradwood facility site and pipeline through the Oregon sloughs toward the vicinity of the Columbia River cross-channel HDD location is within what has been designated as Reach C of the estuary (NOAA 2006). The LNG facility lies just upriver from Reach B.

Reach B has been referred to as the mixing zone of the estuary. This is an area of mid-channel shoals and flats with high salinity variation due to interaction of tidal cycles and river flows. Reach B is where the estuarine turbidity maximum (ETM) occurs (NOAA 2006). Over the course of development of the mainstem Columbia River (hydropower development) and diking and filling of the estuary, there has been a loss of 65% of the tidal marshes and swamps (i.e., 121.6 km²) that existed prior to 1870 below Jones Beach at Rkm 75 in Oregon (Bottom et al. 2005). This loss has been associated with channel deepening, loss of large wood debris, shoreline armoring, logging and agriculture, and deliberate filling of the tidal marshes and swamps themselves (Bottom et al. 2005).

These changes in the river caused a shift from a macrodetritus-based food web to a microdetritus-based food web. The microdetritus food base derives from phytoplankton originating from the upriver reservoirs and supplies the energy base to calanoid copepods and other pelagic organisms, which unfortunately are not consumed to any extent by juvenile salmon (Bottom et al. 2005). This organic material that passes through Reach C and enters the Reach B mixing zone, becoming transferred to copepods, is used by pelagic fish such as anchovy, smelt, shad, and herring, but the food base for juvenile salmon associated with shallow water habitats has become impoverished (Bottom et al. 2005). This places much greater emphasis on maintaining and expanding the productive capacity of those estuarine habitats (tidal marshes, swamps, mud flats, and shallow habitats with emergent vegetation) that support the portion of the food web that direct energy toward juvenile salmon. Salmon fry and fingerlings occupy habitats preferentially that are between 10 cm and 2 m

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

deep (Bottom et al. 2005). The DEIS does not adequately account for the current availability of these habitats within Reach C (Bradwood) or Reach B (Svensen Island area) relative to historic condition. The DEIS does not clearly describe the effect of the project on these habitats. Even the historic condition of the shallow water habitats in the vicinity of the proposed Bradford Landing LNG facility was not described. What is known is that functional shallow water habitat in the log pond will be filled to create a base for the facility.

• NorthernStar Estuary Classification Scheme

The Plan adopts crude and inaccurate descriptions of the boundaries of the estuary that enable it to justify finding mitigation sites that suffice as replacement for habitat that is to be obliterated.

p. 9. NorthernStar Mitigation Plan (Aug. 1, 2007). *Oregon mitigation sites (specifically Svensen Island) are located in the lower Columbia River estuary ("Estuary means a body of water semi-enclosed by land and connected with the open ocean, within which salt water is usually diluted by fresh water derived from the land. In the general sense, 'estuary' includes all estuarine waters, tidelands, tidal marshes and submerged lands extending upstream to the head of tidewater. However, the Columbia River Estuary has been more narrowly defined to extend to the western edge of Puget Island [ORS 54.605])."*

p. 47. NorthernStar Mitigation Plan (Aug. 1, 2007). *The estuary is the transitional area between fresh and salt water. Downstream flow plus significant tidal fluctuations create a complex array of currents, salinities and bathymetry and a great diversity of potential habitats. This complexity is captured in several related classification schemes. The NPCC (2004) scheme is based on Simenstad et al. (1984) and has been used in the NOAA salmon recovery plans (NOAA Fisheries 2006). The areas in Figure 2-3 are grouped into two major subsystems defining the estuary proper and upriver tidally influenced areas. The estuarine subsystem is the lower 46 miles up past Puget Island (and Bradwood Landing). Areas in Figure 2-3 above Puget Island are classed as the tidal freshwater subsystem.*

p. 48. NorthernStar Mitigation Plan (Aug. 1, 2007). *Svensen Island lies along the south edge of Cathlamet Bay approximately 14 miles downstream of Bradwood Landing (Figure 1-1). Cathlamet Bay is a distinct reach of the river in the Simenstad et al. (1984) scheme (reach "B" in (NOAA Fisheries 2006)) shown in Figure 2-3.*

It is not discussed in the mitigation plan that Bradwood Landing is in NOAA's Reach C, as opposed to Svensen Island, which is in Reach B. See Figure 1 below for the biological zonation of the Columbia River estuary and Figure 2 for the relationship of Bradwood Landing to Svensen Island.

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

Figure 1. Lower Columbia River Estuary Reaches. Reprinted from Lower Columbia River Estuary Partnership (2004). Also, see NOAA (2006) for a similar presentation of this chart.

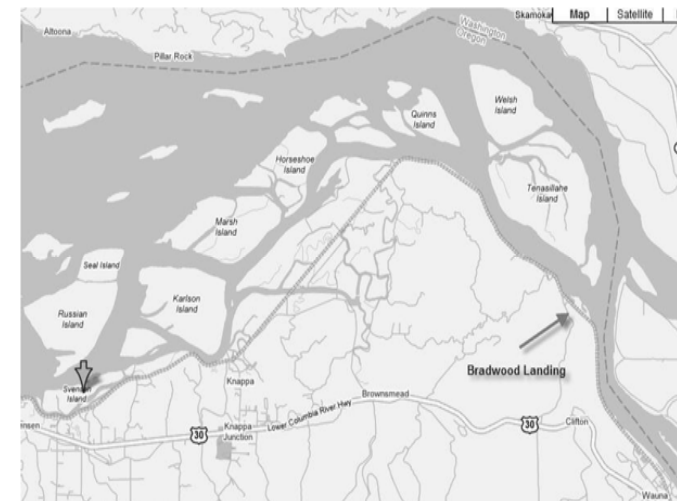

Figure 2. Location of Bradwood Landing and Svensen Island downstream on the Columbia River.

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

Bottom et al. (2005) indicated that the estuary was classified by Simenstad into the following reaches:

We define the Columbia River estuary (Figure 1) to include the free-flowing waters that are influenced by oceanic tides: a reach spanning 235 river kilometers (Rkm) [146.0 RM] from the mouth to the base of Bonneville Dam. Relative to juvenile salmon migration along the estuarine gradient, this system includes three physiographic subsystems:

- the tidal freshwater portion or fluvial region (Simenstad et al. 1990a) from Bonneville Dam to the maximum upstream extent of salinity intrusion (≈ 55 Rkm [34.2 RM] from the entrance),
- the brackish-mesohaline region above the open expanse of the main estuary (≈ 30 –55 Rkm [18.6–34.2 RM] from the entrance), and
- the broad, euryhaline region in the lower 30 Rkm [18.6 RM] of the estuary. Ecological studies in the estuary during the early 1980s further partitioned the euryhaline region into seven subareas (Simenstad et al. 1990a):

- 1) entrance,
- 2) Trestle and Baker bays in Oregon,
- 3) Youngs Bay in Oregon,
- 4) estuarine channels,
- 5) mid-estuary shoals of the estuarine mixing zone,
- 6) Grays Bay in Washington, and
- 7) Cathlamet Bay in Oregon.

Svensen Island is located 36.4 km [22.6 RM] upstream of the Columbia River mouth, while the proposed terminal site at Bradwood Landing is located at 61 km [38 RM, see p. ES-1] upstream. According to Simenstad's classification, Svensen Island is located in the lower brackish-mesohaline region, which extends upstream as far as Rkm 30. The terminal site, on the other hand, is located in the tidal freshwater region. Rather than two subregions as stated in the Mitigation Plan (Aug. 1, 2007), the estuary is subdivided by Simenstad into three regions. The mitigation site is in a different region than the site being obliterated.

The likelihood of being able to restore Svensen Island to a condition expected to be useable as a replacement for habitats lost as a result of the project has not been revealed. Parts of Svensen Island have been separated from the estuary for many years. Typically, these kinds of former habitats maintain their elevations by interaction with river flows, production of organic matter, accretion of sediments, etc. Disconnection from the river over the long term results in subsidence. Restoring connection may initially result in creation of mudflats or other types of habitats, depending upon the elevation of the island in relation to the tidal elevations. None of this information was discussed.

Salinity conditions are significantly different between the Svensen Island portion of the Columbia River and upstream at Woody Island, which is downstream of Bradwood Landing. At Svensen Island, the maximum salinities are 6.6 ppt, while at Woody Island, maximum salinities are 0.2 ppt. (See <http://www.ccalmr.ogi.edu/CORIE/>). At Bradwood, salinities would be even less, much closer to freshwater conditions. Consequently, even though restoration of Svensen Island is a worthy project for the overall estuary ecosystem, the destruction of rearing habitat at Bradwood Landing represents a permanent loss of important lower river estuary habitat that is especially significant for chum and fall Chinook salmon. This is a permanent loss that is not mitigated.

FERC Fails to Fully Assess the Problems Associated with Ballast Withdrawals

Approximately 125 LNG ships are expected to enter the river per year, and approximately 6.3 billion gallons of Columbia River water per year will be used by these ships as ballast. A smaller

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

amount of water would likewise be withdrawn and used for engine cooling. The design proposals for ballast intake for this project have changed dramatically over the course of the pre-filing and post-application phases of the proposal. At this time, we understand that the current "live" design for intake for the purposes of ballast/engine cooling will be on the berth, noted on Figure 2.1.3-3. In reviewing this proposal, we have come up with essentially four issues that the DEIS and the applicant must address before the project is licensed.

First, this proposal necessitates a third-party provider (the ship owners) to take affirmative actions to retrofit its ships to meet the design of the terminal. Currently, the only mechanism apparently available to "enforce" this requirement is the applicant's assertion that it would offer "contract incentives" (pg. 2-7) for these third-party providers to obtain the retrofit. Recently, the U.S. District Court in Oregon in *National Wildlife Federation v. National Marine Fisheries Service*, determined that NOAA Fisheries could not rely on actions that were "not reasonably certain to occur." See, *National Wildlife Fed. v. National Marine Fish. Serv.*, 254 F. Supp.2d 1196, 1215 (D. Or. 2003). While this is an ESA standard, it bears notice to FERC in this case because it is clear that it is unreasonable to rely on the applicants' promise to contract with third party entities which do not fall under FERC or NOAA Fisheries' enforcement authority. There is no guarantee, at this point, that NorthernStar would turn away a non-retrofitted ship should one show up at its terminal.

Second, we are unconvinced that this is technologically available or even testable at this time. FERC and the applicant must provide more information on the berth-side intake system and the ship retro-fit and demonstrate that fish will not be adversely impacted by its use. Similarly, our third issue is the concerns about the use fish screens (and cleaning pump) to avoid entrainment and impingement of fish traveling through Clifton Channel [comments below in a subsequent section].

Fourth, after examining the plans for a berth-side water intake system, it appears that NorthernStar will likely have to obtain a water right. The immense amount of water that will be withdrawn – on the magnitude of a small agricultural operation – is of great concern with regard to resulting temperature and flow effects on the river, and subsequently, on fish. The DEIS fails to adequately assess the impacts to the area from this water withdrawal.

If the project once again changes its ballast water withdrawal system design to rely on the conventional ship-side intake system, we will have greater concerns as the risk to small juvenile fish which are in the area for much of the year would be very high.

Permitting and Compliance Processes are Not a Substitute for Analysis

In its assessments of many of the project's impacts, the DEIS repeatedly lists consultation and permitting procedures that must be completed, instead of reasonably evaluating and disclosing the impacts of the project as it will be implemented. Description of permitting, compliance processes, and consultation requirements are not a surrogate for a full description of the project's impacts. If FERC believes that these required procedures will have a substantive effect on the project's impacts, then FERC must not issue an FEIS until these procedures have been fully completed with the results analyzed and disclosed in the FEIS. Until then, listing consultation and permitting procedures is largely irrelevant regarding disclosure of the project's impacts.

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

Speculative Actions and Speculative Assessments of Impacts

The DEIS repeatedly makes arbitrary and conclusory assessments of measures that are highly speculative in terms of implementation and outcomes. This repeated flaw is compounded by the DEIS's consistent failure to reasonably consider and disclose the project's impacts if these speculative and optional measures are not implemented. For instance, the DEIS (p. 4-46) notes that for activities in wetlands and other soils susceptible to compaction "...environmental inspectors *could* recommend restricting construction activities during unfavorable conditions (e.g., wet weather) to further reduce [soil] compaction and rutting." (Emph. added). This is plainly speculative and largely irrelevant. There is no requirement to restrict activities to limit such soil damage.

Similarly, the DEIS repeatedly asserts that the use of HDD to place pipelines across waterbodies will limit impacts on riparian vegetation and the waterbodies. However, HDD may not be used to cross any waterbody. The DEIS (p. 4-84) notes that, instead, other methods besides HDD may be used for stream crossings by the pipeline. However, the DEIS does not adequately assess and disclose the impacts of stream crossing if methods other than HDD are used to cross streams.

As another example, the DEIS (p. 4-117) notes that when available, certified seed would be used for revegetation of areas disturbed by pipeline construction. This clearly indicates that this measure may not be implemented, depending on availability. The DEIS includes no assessment of impacts that will occur if this speculative measure is not implemented.

Similarly, the DEIS includes discussions of the potential measures that might be taken under the SEI, although the timing, nature, and location of actual measures that might be taken under the SEI are currently unspecified and entirely optional. Therefore, the potential effectiveness of SEI measures is unknown and cannot be reasonably determined, although this is not adequately disclosed in the DEIS.

The DEIS (pp. 4-106, 4-107) also discusses the potential efforts on Delameter Creek that might be taken in an effort to mitigate the permanent damage to forested wetlands. However, the timing, nature, and location of actual measures along Delameter Creek are unspecified, not required, and uncertain to actually occur. The DEIS fails to adequately disclose this ambiguity or the project's impacts if these speculative measures are not implemented. Space constraints preclude listing the many other numerous instances where the DEIS evaluates the effects of measures that are not required, specified, or sure to occur.

In order to remedy these defects in its discussions of impacts, the FEIS must focus solely on activities that are required with a degree of specificity that allows evaluation of their impacts. If discussions of optional, unspecified measures are retained in the FEIS, the FEIS must clearly disclose that these activities and measures that are not required and may not occur. It must also reasonably evaluate the consequences if such optional, speculative measures are not implemented. The FEIS needs to rectify all such defects in the DEIS, not just the specific instances cited in the foregoing.

FERC Fails to Analyze Cumulative Effects

The DEIS fails to assess the project's cumulative effects on aquatic resources in several ways. It primarily provides piecemeal analysis of individual impacts or activities. For instance, the project activities will significantly elevate sediment delivery to Hunt Creek due to a variety of impacts from numerous activities, including the construction and maintenance of railroad re-alignment, power lines,

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

bridge work, road activities, and the LNG terminal. However, the DEIS fails to provide any credible cumulative estimate of the magnitude and persistence of sediment delivery to Hunt Creek and the Columbia River from these cumulative sources and activities. Similarly, the DEIS fails to assess and disclose the cumulative impacts of cumulative sediment delivery from these multiple activities on water quality and aquatic habitat in Hunt Creek. In so doing, the DEIS fails to adequately disclose the cumulative effect of activities in Hunt Creek on fish survival and production.

In a similar vein, elevated sediment delivery from the impact of multiple activities in the Hunt Creek watershed will elevate turbidity in Hunt Creek and the Columbia River. However, the DEIS fails to reasonably disclose how this cumulative sediment delivery from all project activities in the Hunt Creek watershed, in combination with terminal construction, deposition of dredge material, and dredging will cumulatively affect turbidity in the Columbia River. The piecemeal, qualitative, and cursory assessments of individual activities on sediment delivery and turbidity in the DEIS are not adequate to disclose these cumulative impacts.

Similarly, as discussed later in these comments, the DEIS also fails to reasonably analyze and disclose the cumulative impacts of pipeline construction on sediment delivery to streams. It also fails to adequately disclose the total impacts of this cumulative sediment delivery on water quality, and fish habitats at the watershed scale. The DEIS also failed to reasonably disclose the impacts to the Columbia River from cumulative delivery from pipeline construction and maintenance activities.

Pipeline construction and maintenance will persistently remove stream shade and contribute to channel widening via elevated sedimentation in many streams. However, the DEIS fails to disclose the cumulative effects of these impacts on water temperature in affected watersheds, or in the Columbia River, which will ultimately receive the water with elevated temperature.

The DEIS is riddled with so many other examples of this recurrent type of defect that space does not allow a complete listing of their occurrence. It is critical that the DEIS be revised so that the FEIS clearly and fully analyzes and discloses the cumulative impacts of all project activities that are likely to combine to produce adverse cumulative effects.

Disclosure requirements are not the only reason that cumulative impacts must be clearly and thoroughly analyzed. Although there are many reasons that it is unlikely to be realized, the DEIS (e.g., pp. 2-27, 4-95) repeatedly asserts that the applicant purportedly aims for the project to have an overall environmental benefit to the lower Columbia ecosystem. In order to reasonably assess the veracity of this claim, it is obvious that negative cumulative impacts of all aspects of the project must be fully determined and disclosed. Notably, because the negative cumulative impacts of the project have not been adequately determined in the DEIS, FERC has no basis for asserting that the project meets this purported goal.

Existing Condition of Affected Aquatic and Watershed Resources

Existing conditions of affected aquatic and watershed resources exert a strong influence on the significance and persistence of impacts to these resources, although the DEIS fails to adequately disclose this. For instance, in streams that are already afflicted by high levels of sediment delivery and sedimentation, additional sediment delivery is likely to significantly and persistently add to existing problems (Rhodes et al., 1994). Similarly, in streams afflicted by a lack of large in-channel wood and high water temperatures, any additional exacerbation of these problems is ecologically significant. Notably, many of the stream attributes that will be affected by the project activities are already

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

significantly degraded (e.g., WDFW, 2000), although the DEIS fails to adequately disclose this. The currently degraded state of stream and watershed attributes that will be affected by the project is also acknowledged, albeit inadequately, in the project's Biological Assessment (BA) (FERC, 2007).

Although it is not reasonably disclosed in the DEIS, additional habitat damage that affects weak populations of salmonids in degraded watersheds increase the likelihood of extirpation (USFS and USBLM, 1997a; 1997c; Karr et al., 2004). Such impacts can be profound. Extirpations and habitat degradation decrease population connectivity, increasing the likelihood of extinction or additional extirpations.

Other stream attributes also influence the magnitude and persistence of habitat degradation associated with the projects impacts. Many types of low gradient streams are extremely susceptible to persistent sedimentation problems associated with the elevated sediment delivery that will be caused by project activities (Rhodes et al., 1994; Espinosa et al., 1997; Montgomery and Buffington, 1998). Many types of higher gradient streams are extremely susceptible to degradation due to loss of channel stability from vegetation removal and have very poor prospects for recovery from such degradation (Rosgen, 1996).

Although it is inadequately disclosed in the DEIS, the project will significantly degrade aquatic habitat conditions and water quality by elevating sediment delivery, removing stream shade, reducing the recruitment of large woody debris (LWD), and reducing bank stability in numerous streams that are either tributary to or provide habitat for a significant number of salmonids that are highly imperiled. These impacts will reduce the survival and production of these salmonids in many ways, including reductions in pool quality and volume, degradation of stream substrate, channel widening, loss of stream complexity, loss of LWD, increased suspended sediment, and elevation of stream temperatures. However, the DEIS fails reasonably disclose the current condition of these affected aquatic habitat attributes in streams that will be affected by the operation and construction of the terminal, pipeline, transportation network, railroad re-alignment, and associated powerline construction. The DEIS also fails to reasonably disclose the existing conditions of affected populations at the watershed scale that will be affected by the project. The DEIS also fails to analyze and disclose the attributes of affected streams and waterbodies that influence aquatic impacts.

These significant flaws must be rectified in the FEIS. The FEIS must disclose the existing condition of affected aquatic resources at the watershed scale for all affected streams and waterbodies, including those that will have tributary impacts. At a minimum, this must include a description, at the watershed scale, of the status of affected fish populations, substrate, channel width, the frequency and quality of pools, water temperature, LWD, bank stability, stream shade, channel width/depth ratios, turbidity, and sediment delivery. The FEIS must also include a description of the attributes of water bodies affected by the project, including identification of sensitive reaches, based on available scientific information.

Magnitude, Type, and Location of Impacts That Will Affect Water Quality and Fish Habitat

There is a considerable body of information indicating that ground-disturbing activities that occur within several hundred feet upslope of streams and waterbodies have numerous negative and enduring impacts on the waterbodies and streams. These impacts include alteration of groundwater-surface interactions from soil compaction, elevated sediment delivery, loss of bank stability, loss of thermal regulation, loss of the capacity to detain sediment from upslope sources, and loss of LWD (USFS et al., 1993; Rhodes et al., 1994; CWW, 1996). These impacts cumulatively degrade adjacent

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

and downstream aquatic habitats and water quality in ways that reduce the survival and production of salmonids. However, the DEIS completely fails to reasonably disclose the extent of project activities within the area along streams and waterbodies that causes degradation.

Given available information on impacts to aquatic systems as a function of their proximity to waterbodies and streams, the DEIS should be revamped to disclose *all* of following aspects of all project activities⁵ that will occur within at least 300 feet upslope of all stream channels and waterbodies, including intermittent channels and those that do not provide fish habitat⁶:

- 1) the location and area of vegetation removal and soil disturbance, including soil compaction;
- 2) the type and amount of vegetation removed;
- 3) the nature and degree of soil impacts, including compaction, removal of soil cover, and alteration of soil properties;
- 4) the distance to the nearest channel or waterbody;
- 5) the type of activity;
- 6) activity duration and expected season(s) of occurrence;
- 7) spatial connectivity of the nearest channel/waterbody to fish habitat and identification of the fish populations using the habitats;

The foregoing information must not only be disclosed, but also factored into disclosure of the project's impacts on aquatic resources, including all essential fish habitat attributes (LWD, substrate, channel morphology, etc), the survival and production of fish populations, channel erosion, bank stability, sediment delivery, and all affected aspects of water quality.

Notably, for more than a decade, the sort of information listed above has been routinely included in EISs for logging and road construction activities in watersheds with imperiled salmonids, indicating that it is both tractable and necessary to include. The project will have impacts on aquatic resources and the areas along streams that will be more severe, extensive, recurrent, and persistent than those from most logging and road activities.

The current discussions of impacts to riparian areas in the DEIS are highly inadequate for several reasons. First, they do not describe the amount of area occupied by activities occurring within the distance to streams that strongly influences impacts on water quality and fish habitat. Second, the DEIS fails to clearly identify and disclose stream crossings by the pipeline that do not supply fish habitat, but are tributary to fish habitats. For instance, the DEIS's (pp. 4-79 to 4-82) summary listing of waterbodies crossed by the pipeline fails to clearly identify tributaries and intermittent stream that will be crossed by the pipeline that may not supply fish habitat but do influence fish habitat conditions because they are tributary to fish-bearing streams. This is insufficient because impacts to upstream segments lead to the degradation of downstream fish habitats and water quality.

The DEIS similarly misleads in its discussion of the impact of power line construction and maintenance, incorrectly stating that impacts on non-fish-bearing tributaries to the fish-bearing Hunt Creek are unlikely to have impacts on downstream fish habitat (DEIS, p. 4-154). This is in direct

⁵ At a minimum, these aspects should include all areas that are subject to heavy machinery operation, soil compaction, vegetation removal, grading, filling, and/or excavation, including the construction, operation, and maintenance of the terminal, pipeline, railroad alignment, roads and bridges, and power line.

⁶ Impacts to intermittent streams and streams without fish need to be included because impacts to these parts of the stream network are translated downstream to fish habitats, affecting habitat conditions and downstream water quality. Water quality and fish habitat conditions are strongly influenced by upstream impacts and conditions (e.g., USFS et al., 1993; Rhodes et al., 1994; CWW, 1996).

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

conflict with available scientific information. Simply enough, impacts to streams and water bodies are translated downstream.

These significant defects must be thoroughly rectified. The DEIS must be revised to clearly identify all tributaries to fish-bearing streams that will be affected by project activities. The DEIS must also be revised to completely and clearly disclose that impacts to intermittent and/or non-fish-bearing streams have water quality impacts and contribute significantly to the degradation of downstream fish habitat.

Risks and Hazards

• Gas Spillage to the River

The LNG facility is proposed for the Bradwood Landing site, 39 miles upriver within the estuary zone. This facility siting creates several problems. The ecological risk incurred by tankers of flammable liquid the size necessary to transport LNG under the Astoria Bridge is high. Because the LNG ships have such a high freeboard, making their maneuverability treacherous at low speeds (p. 2-3), there is additional reason for concern in these ships passing under the Astoria Bridge. LNG ships that would lose their liquid cargo in the river or from pipeline leaks could compromise much greater extents of habitat than would facilities sited close to the river mouth. Trapping of gas in marginal estuarine habitats could cause intense localized damage to rearing salmon populations.

Each LNG ship would maintain a Shipboard Oil Pollution Emergency Plan (SOPEP). (p. 4-67). It is not clear how carrying a plan on board would be effective in dealing with a spill or leak. What materials are available on board that would actually assist in limiting the spill or leak? What materials would be required at the Bradwood Facility or at stations throughout the course of the pipeline to rapidly deal with major leaks or spills?

• Spread of Exotic Organisms

The Columbia River food web has become highly altered by spread of exotic organisms, likely transported to the Columbia by ship traffic (NPPC Return to the River, Williams et al. 1996). The DEIS (p. 4-124) states that it is unlikely that the LNG ships would introduce exotic species because the Coast Guard has a plan for conduct of ships entering the Columbia. The DEIS is not at all clear how LNG ship ballast would be treated to eliminate this threat or where ship hulls and anchors would be treated to eliminate exotics without contaminating the Columbia.

• Fish Screens

The DEIS discusses the use of fish screens for various water intakes. While the NOAA criteria are generally acceptable, we are concerned about NothemStar's use of an air burst system for cleaning. These systems may or may not meet the NOAA criteria of a "proven" cleaning system. A mechanical cleaning system should be included in the design to insure there is a back up to air burst system or in the instance if the air burst system is overwhelmed. Aquatic weeds and wood chip both present in the estuary have been shown to overwhelm systems at fish facilities on the Columbia.

Further it is unclear if the temporary pumps meet the passive screen criteria the NOAA has developed. If the screens do not meet the passive standard then a "proven" screen cleaning system

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

would need to be added to the diversion screens. The NOAA criteria for passive pump system appears to conflict with the system proposed in the DEIS:

Passive pump intake screens have no cleaning system and should only be used when the debris load is expected to be low, and

- 1) if a small screen (less than 1 CFS pump) is over-sized to eliminate debris impingement, and
- 2) where sufficient sweeping velocity exists to eliminate debris build-up on the screen surface, and
- 3) if the maximum diverted flow is less than .01% of the total minimum streamflow, or
- 4) the intake is deep in a reservoir, away from the shoreline.

See NMFS 1996. NOAA Screen Criteria Addendum: Juvenile Fish Screen Criteria for Pump Intakes. The Bradwood location is likely not expected to be in a low debris location, the required pumping rate will not be conducive to using a small screen because the pumps required will be >>1 CFS capacity, and the sweeping velocity is purely site location.

Moreover, due to the location of the Bradwood site, *i.e.*, 38 miles upriver, the size of most of the salmonids who will be rearing in the area will be small. FERC must consider this issue as impacts will be greater to smaller sized fish and probably less able to adequately quantify the impact.

• Fish Stranding

Shipwake stranding is potentially a significant problem in the lower Columbia. NOAA (2006) reported that:

A study in 1977 by the Washington Department of Fisheries estimated that more than 150,000 juvenile salmonids, mostly chinook, were stranded on five test sites as a result of ship bow waves striking shorelines (Bauersfeld 1977). Additional studies since the Bauersfeld study have not documented the same level of mortality. Results from a new study by the University of Washington and the Portland District of the U.S. Army Corps of Engineers indicate mortality from ship wakes; however no existing research has been directed to extrapolating the results to pertinent reaches of the lower river. (Pearson et al. 2006).

The DEIS, however, states:

(Pg. 3-28) *The wakes of LNG ships may result in the stranding of juvenile fish at specific locations and contribute to river bank erosion (see sections 4.6.2.1 and 4.1.3.3, respectively).*

(Pg. 4-122) *LNG marine traffic during operation of the Bradwood Landing Project has the potential to impact aquatic species through fish strandings, increased shoreline erosion, introduction of exotic species, vessel strikes, and releases of LNG. Much of the impact discussion included below applies to the salmonids protected under the ESA, which are described in detail in section 4.6.1.1.*

(Pg. 4-123) *It is noteworthy that the three sites chosen for the Pearson et al. (2006) study are located upstream of Bradwood and the portion of the river that the LNG ships would transit to reach the proposed LNG terminal. Reported strandings are greater upriver of the proposed LNG terminal compared to down river. Only one record of wake stranding (on Tenasillake Island at about CRM 37) was found for the lower river downstream of the proposed LNG terminal site. There would appear to be important differences in the lowermost 38 miles of the Columbia River, compared with the portions of the river above the proposed LNG terminal site. The lower part of the river is broader, and distances from the navigation channel to beaches are generally greater than in the upriver segment. The sampled densities of juvenile salmon are lower in the lower river shallows. Further, the effects of tides, currents, and winds may be more variable in the lower Columbia River.*

The comments in the DEIS conflict with what was reported by NOAA (2006). If there have been no significant studies of stranding in the lower Columbia, it is not possible to conclude that strandings in the lower river would be less than in the upper. Also, the claim that the lower river is wide so would have less problem with stranding doesn't apply to the full travel of the LNG ships to

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

Bradwood. The channel becomes very narrow upon passing Welsh and Tenasillahe Islands and stranding here could be great. Although the DEIS claims that different deep draft ships have different tendencies to strand fish, there was no information presented on the probable tendency of the LNG ships to cause such a problem.

In a study of ship wake erosion in the Columbia River, it was estimated that ship wake could account for 4 to 24 percent of the total erosion observed at the Puget Island disposal site. (Abbe 1989). With the impact of ship traffic passing Puget Island adding to natural erosion rates on Puget Island, it is likely that erosion from dredge deposits made around this island taken from near the Bradwood terminal could accelerate sediment deposition downriver in rearing habitats. The ongoing dredging might make such deposits accumulate at greater rates.

- **Hazards at the Bradwood Facility**

(Pg. 4-12) The final engineering design for the LNG terminal would incorporate detailed seismic specifications and other measures to mitigate the impacts of seismic hazards.

Loosely deposited dredged fill and alluvium along the shoreline of the lower Columbia River are typically susceptible to liquefaction. Damage due to liquefaction may be manifest in several ways, including temporary loss of bearing support leading to liquefaction-induced settlement and differential settlement of structures; temporary loss of bearing support and subsequent ground subsidence;

The foundation for the LNG facility will be placed on unconsolidated sand and gravel from the river and detailed seismic investigations will not be made until very late in the process, after the facility is already permitted. It appears highly likely that liquefaction of the loose fill at the facility site could occur and be mobilized by seismic activity. The plan is to place 350,000-400,000 yd³ of dredged fill on the LNG terminal site to raise the elevation by 20 ft. This would place 19.7 acres of the terminal site that are currently within the 100-year floodplain above the 100-year floodline (p. 4-70). Corps of Engineer standards for estimation of 100-year floodplains have changed substantially in recent years. It is very likely that a terminal in the floodzone would easily become destabilized by flood waters.

Details of seismic studies are not planned until the early design phase (p. 4-13). This disclosure of potential fatal flaws in the plan would come only after approval of the plan.

- **Hazards along the Pipeline**

Seismic studies have not yet been done along the route of the pipeline, even though it crosses various fault lines. The potential environmental impacts of leaks from pipeline leaks caused by ground movement have not been thoroughly evaluated, nor has a means been explained to engineer the pipeline to safeguard it from rupture.

p. 4-20. NorthernStar identified 110 potential landslide areas in table 4-1 of NorthernStar's Geohazards Report, and ranked each feature by the confidence level that it may be a significant area of unstable slopes.³ The proposed pipeline would cross 31 potential landslide areas; however, some of these are considered lower confidence features that may require no mitigation following field confirmation.

It is not clear how landslide hazards in steep terrain can be mitigated when there is a possibility of the pipeline being dislocated from a hillslope and spilling the contents into a local drainage. In addition, if the pipeline is planned for hazardous slopes, it is not clear why avoidance of these slopes would not be

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

the first priority. Local impact to salmon-bearing streams is of concern, both for destabilization of the slope from pipeline placement and from damage to the pipeline from upslope activities from forestry.

- **Effects of Continuous Lighting on Neighboring Wetlands**

FERC acknowledges some problems with lighting – both during construction and operation of the terminal – on aquatic species, yet there is a lack of studies conducted or reviewed that would analyze what those effects would be. Some potential issues to consider would be increased predation by limiting the amount of refuge, increased stress, loss of food sources, etc. FERC needs to fill this information gap.

FERC'S Analysis of Alternatives Lacks Substance

The DEIS conducts a superficial assessment of alternatives that is wholly inadequate for the scope of this project. There is a desperate need for a regional needs-based assessment in order for FERC to make a reasoned, educated decision on whether to license this project and to ascertain whether the goal of providing LNG to the region is a necessary one. FERC needs to assess the viability of other sources of energy, including wind and conservation. In addition, FERC needs to examine alternative LNG sites in the region much more thoroughly than in the current DEIS.

FERC must consider alternative energy sources as part of its "no action" alternative. Alternative energy sources exist and need to be examined, particularly renewables. As Lazarus (2002) found in their report, "efficiency, fuel switching, and combined heat and power (CHP) measures could reduce grid electricity demands by 12% in 2010 and 24% in 2020." Furthermore, the report found that just three renewables: wind, biomass and geothermal, could potentially provide 35% of the region's energy needs. As for cost analysis, the report concluded that investing in renewable resources (solar, wind, biomass and geothermal) "can provide an important hedge against volatile electricity markets" something that LNG can never claim, as it must deal with the value-added costs associated with supply (and demand from other energy-starved countries), shipping and extra labor.

The DEIS summarily reviews proposed LNG terminal sites in the region and likewise summarily concludes that these sites do not appear "environmentally superior" to the Bradwood project. We are not advocating for one LNG project over the other, but we strongly disagree with FERC's unsupported and conclusory dismissal of what may be very viable sites. For example, Oregon LNG's proposed location may have far less impact on the aquatic resources upon which the CRITFC tribes depend. FERC correctly notes that the Oregon LNG sendout pipeline will be longer than the Bradwood project,⁷ but we are equally concerned with Bradwood's 36 mile pipeline that runs adjacent to the Columbia River for many miles and crosses no less than ninety-four waterbodies, many of which are tributaries of the Columbia. This poses a far great risk to the river and its resources.

While the Tansey Point proposal has not progressed in the FERC process (and thus may not be a viable project at this time), FERC contends that it is disadvantaged because of the close proximity of the navigation channel to the berth. It is incongruous to us that this would be a disadvantage compared to the Bradwood site in which less than one half mile separates Bradwood and Puget Island, giving

⁷ Unless, of course, the Palomar Pipeline, becomes the primary sendout for the Bradwood; a likely occurrence considering the news that the Williams Northwest Pipeline at Longview, Washington, is at capacity and currently unavailable to Bradwood. According to the company, they have long-term contracts with domestic gas providers and they are "unlikely to disrupt the relationships we already have with our customers right now." Cassandra Proffitt, *Who Knows Where the Gas Will Go?* Daily Astorian, Nov. 27, 2007.

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

very little space for the Bradwood berth and the navigation channel. Again, we are not advocating for one specific terminal over another, but this is yet another example of FERC's simplification – for the benefit of the Bradwood project – of what should be a very complex analysis.

SPECIFIC IMPACTS

Fish Biology

- **Salmon Life History**

The DEIS is deficient in its description of salmon life histories and critical habitat associated with the estuary and proposed project area and impacts. Juvenile salmonids, including chinook, coho, and steelhead are found in the estuary all year around, in migration corridors, and tidal flats and marshes (Fresh et al. 2004; Bottom et al. 2001). Currently studies are being conducted in the estuary to determine the estuarine lifecycle of these fish, however, major data gaps continue to exist warranting further research. In addition, information on sturgeon and lamprey populations need to be developed as these have been taking major hits upriver. The following discussion examines research that was directed at chinook populations, however, there are likely many parallels to (at a minimum) steelhead lifecycles, as well, as coho.

Because of the nature of tributaries directly entering the lower river and estuary (i.e., Lewis River), as well as fish populations from the mainstem Columbia River, fry, subyearling and yearling Chinook may be present in the proposed project site during much of the year (Dawley 1985 in Fresh et al. 2004). A recent study indicated that 70% of juvenile salmon sampled in the estuary had resided in the estuary from 2-6 weeks and that subyearling Chinook salmon attained 20-66% of their fork length in the estuary (McComas et al. 2007).

Subyearling salmon enter the Columbia River estuary as fry or fingerlings and occupy shallow water habitat predominantly (10 cm-2 m depth), although they are known to also extend their range into deeper waters (Bottom et al. 2005). Among the shallow-water habitats used by subyearling salmon are emergent marshes, forested wetlands, peripheral floodplain channels, and beaver ponds (Bottom et al. 2005). Fall Chinook from above Bonneville Dam (e.g., Hanford Reach fall Chinook, Snake River fall Chinook, Deschutes River fall Chinook) are essential to the Columbia River Tribes' ability to exercise their treaty rights to fish. These fish populations utilize habitats that would be directly affected by the Bradwood LNG proposed activities, involving impacts at the terminal, downstream in Clifton Channel, in the turning basin, on littoral habitats of Puget Island, downstream in the shipping channel, in sloughs of the Columbia River, and associated wetlands. Impacts to these habitats arise from disturbance from dredging, sedimentation from terminal and pipeline construction, dredging, and spoils deposition; water temperature increases in these special habitats due to a combination of riparian harvest, sediment deposition, and shoreline reconfiguration.

- **Salmon Viability and the ESA**

According to the NMFS Cumulative Risk Analysis (CRI) in the 2000 FCRPS Biological Opinion and conclusions from Kareiva and Marvier (2000), survival of listed juvenile salmon in the estuary and near shore environment must be increased to 11-14% in order to prevent jeopardy of listed salmon in the Columbia River and that increasing estuarine survival is key to recovery of stocks (Fresh

CRITFC DEIS COMMENTS

31

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

et al. 2004). Current juvenile estuarine survival estimates range from about 46-89% (Schreck et al. 2004; Schreck et al. 2006). Much of the mortality is due to the loss of productive estuarine habitat, particularly tidal and shallow water habitat and avian predation which is exacerbated by stress that produces poor juvenile fish condition. Analysis by Bottom and Jones (1990) and NMFS researchers (Dawley, pers. comm. 2000) and Congleton et al. (2001) indicate that juvenile salmon in the Columbia estuary have less food in their stomachs than juvenile salmon in other Oregon and British Columbia estuaries. Percy (1992) noted that smaller juvenile salmon (from the lack of food) have higher ocean mortality rates.

The proposed project will degrade Essential Fish Habitat (EFH) and have the potential to directly impact all of the basin's listed and unlisted fish in the estuary. Truelove et al. (2007) note that changes in salmonid movements and salmonids' abilities to disperse in the face of existing, fragmented estuary habitats need to be better defined. The proposed project would create more habitat fragmentation and likely will result in negative changes to fish behavior which will impact fish survival. These impacts cannot be mitigated by the applicants' speculative benefits of creating new habitat. Thus, the proposed project is not considered in the DEIS in context with overall actions in the basin to promote basinwide salmon recovery.

- **Salmon Habitat Use--Mainstem**

Available juvenile radio tracking data indicate that Columbia River fall Chinook migrate and may rear around the north end of Puget Island near Cathlamet, Washington (Schreck et al. 2002). This is directly in the proposed project turnaround lane that would be dredged. The DEIS fails to address this issue.

In radio and acoustic telemetry studies of juvenile salmon migrating through the CR Estuary, Schreck et al. (2005) and Truelove et al. (2007) found that migration speeds were enhanced by outgoing tides. All fish showed a positive relationship between travel velocity and water flow during outgoing tides. Fish migration, behavior and location is also significantly influenced by estuarine physical parameters, such as temperature and salinity (Fresh et al. 2004). The DEIS has failed to analyze the proposed project dredging impacts to these critical parameters, both from a short-term and long-term perspective. Deepening the shipping channel for the turnaround area has the potential to cause the saltwater intrusion to shift upstream. This could cause changes to the Estuary Turbidity Maximum (ETM) and impact tidal regimes, possibly causing delay to outmigrating salmonids and longer smolt development rates.

Deepening the shipping channel for the turnaround area will likely increase the salinity wedge upstream which could cause fish to move higher in the water column to avoid the increased salinity (See Lower Columbia Channel Deepening FEIS). Delay of salmonid migration can cause increased exposure to avian predators, a key mortality factor for juvenile salmonids migrating through the estuary (Schreck et al. 2005). Avian mortality estimates have been cited from 11-17% of all Columbia River smolts (Schreck et al. 2006) and as high as 23% for yearling Chinook and 29% for steelhead (Schreck et al. 2005). For 2002, NMFS estimated that some 126.5 million juveniles arrived at the estuary, indicating that some 7.6-15.2 million were consumed by avian predators, the majority using habitat created by existing dredging spoils. The DEIS has not identified, much less addressed this issue.

Data from High and Bjornn (2001) and Goniera and Bjornn (2001) indicate that adult salmon below Bonneville Dam migrate as deep as sixteen meters below the surface and seek cool

CRITFC DEIS COMMENTS

32

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

temperatures. Adult salmon at these depths would be at risk from proposed project dredging activities including contact with the dredging machinery and contact from turbidity plumes. Hydroacoustic studies by Ploskey et al. (2001) and sampling by Backman (2000 pers. com.) indicate that juvenile salmonids can be found migrating in the water column at depths of 30-40 feet in the impounded river and in the free flowing river below Bonneville Dam. Juvenile salmon tagging studies indicate that tracked fish through the Columbia River estuary could be detected at depths greater than 5 meters below the surface, although the study authors recommended additional studies to confirm this (Truelove et al. 2007). Thus, juveniles would be subjected to mechanical and turbidity plume impacts of dredging as well as exposure to toxics in sediments. Schreck et al. (2004) and Schreck et al. (2005) noted that most radio-tagged juvenile steelhead migrate through the navigational channel, near the area that is proposed for additional dredging. This fact was not noted in the DEIS. The DEIS assumption that salmon do not actively migrate below 20 feet is not supported by any scientific literature.

- **Salmon Habitat Use--Tributary**

The proposed pipeline runs south from Bradwood Landing, either up Hunt Creek or up to a ridge above Hunt Creek, upriver along the southern border of the Columbia River, through approximately 19 km of Oregon slough habitat, crosses under the Columbia River near Abernathy Creek, Washington, and then runs eastward in Washington approximately 12 km through low to moderate slope instability terrain, then through approximately 12 km of moderate to high slope instability terrain to a terminal north of Longview (Figure 4).

Along this path fall Chinook-bearing tributaries are crossed at Westport Slough, the Clatskanie River, Abernathy Creek, Germany Creek, and the Cowlitz River (Figures 5 and 6). The Cowlitz also provides habitat for spring Chinook. The DEIS does not discuss habitat use by these species in the vicinity of the impact zones. Cameron Creek is a major tributary crossed that drains to Abernathy Creek.

Coho habitat is affected in Hunt Creek, Westport Slough, Clatskanie River, Abernathy Creek, Germany Creek, and the Cowlitz River (Figures 7 and 8). Steelhead habitat is affected in Westport Slough, Clatskanie River, Cameron Creek, Abernathy Creek, Germany Creek, and the Cowlitz River (Figures 7 and 8). Coastal cutthroat habitat is affected in Hunt Creek, Driscoll Slough, Westport Slough, Clatskanie River, Cameron Creek, Abernathy Creek, Germany Creek, Coal Creek, the Cowlitz River, and Ostrander Creek (Figures 7 and 8). The extensive coho, steelhead, fall Chinook, and coastal cutthroat distributions in the Clatskanie River and Cowlitz River, and the additional spring Chinook distribution in the Cowlitz make these tributaries to the Columbia River especially of great concern in downstream impacts of the pipeline on migratory habitat and spawning/rearing habitats.

When examining the small tributaries crossed at a map scale of 1:24K in Washington alone, as an example, it is clear that the number of crossings becomes magnified greatly (Figure 9). Superimposing a map layer of the slope instability hazards on the pipeline route, where the pipeline is mapped at a corridor width of 100 ft and the stream courses have a uniform 50-ft width assigned to them, it is clear that there is a large impact area (Figure 10). The western half of the pipeline run through the forests of Washington have a high concentration of uniformly distributed high hazard slopes (Figure 11) while the eastern half has a sparser distribution of high hazard slopes but a large number of moderate hazards (Figure 12). Although the DEIS failed to indicate what riparian buffer width was actually affected in pipeline corridors, it would make sense to consider a minimum of 200 ft on each side of each tributary as being affected in ways that would contribute sediment to the drainage system, affect stream heating, or alter LWD inputs. The extensive sloughs on the Washington side of

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

the Columbia downstream from these hazardous slope areas that could experience elevated erosion and mass failure incidence due to pipeline construction could be at risk of degradation.

The pipeline route extends for considerable distance in terrain with high land instability problems. Although some judicious placement could avoid some of these hazards, it does not appear that it would be feasible to avoid placing the pipeline in terrain with a high hazard for landslides, excessive erosion, and pipeline rupture hazards when traversing the mountainous region north of Longview, Washington. Rupturing of a natural gas pipeline has been reported in the mountainous region of Cowlitz County, leading to gas ignition and fire (Wegmann and Walsh 2001). Even the NSNG Geohazard Map (p. 4-20) provided in the DEIS package of submitted materials indicates that there are 7.13 miles of unstable terrain that the pipeline rests on and 27 separate highly unstable areas of note (p. 4-20). However, a count of the areas ranked as "high" or "medium-high" hazard totals 31. Many other areas are listed as medium hazard.

- **Epidemiology**

Allen and Hardy (1980) note that after construction, the new channel becomes a sink for toxic contaminants that are re-suspended again and again from ship traffic and maintenance dredging. This was not addressed in the DEIS. Much more detailed and specific baseline information on the ecological status of the estuary through field studies is necessary before determining new impacts. This includes fish migration studies, rearing and holding studies, wake studies and additional sediment studies for toxic entrainment. Monitoring and research accomplished after additional dredging would make it impossible to measure the changes in ecological response to new dredging, as the opportunity to establish the baseline before dredging would be lost.

Epidemiological studies for fish in the estuary are critical and should proceed and be included in the FEIS. The DEIS did not consider the methodology of Mac and Edsal (1991: in Ewing 1999) for the study of the loss of reproductive success in Great Lakes trout due to exposure to toxics. Ewing (1999) notes that toxics can affect fish behavior such as schooling, temperature selection, seawater adaptation, endocrine disruption and sexual development to the detriment of the population. The DEIS did not address possible sub-lethal effects that would compromise salmon populations. The current contaminant loading of fish in the lower Columbia and estuary is already excessive. The DEIS did not address heavy metal, other herbicide and insecticide impacts on salmon or their habitat, nor effects of wave action that will re-suspend toxics in shallow water habitat where organic sediments are likely to contain toxics and where salmon rear and rest. The applicant should conduct toxic contaminant screening, bioassay and bioaccumulation studies of sediments and biota along the proposed channel dredging sites and backwaters that will be disrupted by ship wakes. The results from these tests should be included in the FEIS. The FEIS should also contain the updated EPA/Corps Dredged Material Evaluation Framework.

The DEIS lack assessments of synergistic and cumulative impacts to salmon and critical habitat that could result from dredging. These include oil spills from larger vessels and more frequent shipping, bilge dumpings, further toxic contamination from increased shipping and industrial activity and introduction of exotic species that could directly or indirectly impact listed species. Because larger ships are less maneuverable than smaller ships the risk of an accident would be increased. These issues are not adequately addressed in the DEIS.

Sediment Delivery (Surface erosion and Mass Wasting) and Pipeline Construction

20071221-5145 PERC PDF (Unofficial) 12/21/2007 03:12:21 PM

- **The DEIS fails to reasonably disclose the impacts of pipeline construction and maintenance on cumulative sediment delivery to streams and consequent impacts to fish habitats and water quality.**

The DEIS has many defects related to the impacts of pipeline construction and maintenance on sediment delivery to waterbodies. First, the DEIS's assessments fail to incorporate the existing conditions that will be affected by sediment delivery and influence the type, significance, and persistence of these impacts on fish habitat attributes, the survival and production of fish, and water quality.

Second, the DEIS failed to disclose the amount, type, and proximity of land-disturbing activities within a distance to streams that will strongly and persistently contribute to elevated sediment delivery to streams. This defect is compounded by the DEIS's failure to adequately factor these impacts into a credible disclosure of the magnitude and persistence of elevated sediment delivery from pipeline construction and maintenance.

Third, the DEIS failed to reasonably disclose the persistence of elevated sediment delivery from pipeline construction and maintenance. The DEIS (4-166) incorrectly and baselessly asserts that elevated sediment delivery from stream crossings by the pipeline will be "temporary." However, this is contradicted by available information. The DEIS (p 4-166) concedes, "...clearing the pipeline right-of-way would be analogous to, but on a much smaller scale than, timber harvest and associated road construction, which have been found to increase the frequency and magnitude of soil destabilization, erosion, and eventually stream sedimentation..." However, the DEIS fails to reasonably disclose that significantly elevated erosion in logged areas typically persists for at least five years.

Pipeline clearing and resulting disturbance will be more akin to road construction than logging due to associated soil impacts from excavation and heavy machinery. Roads undergo elevated erosion for decades, even after obliteration (Rhodes et al., 1994; CWW, 1996; Beschta et al., 2004). The soil compaction from pipeline construction activities is likely to persist for at least several decades, contributing to elevated surface erosion. The DEIS also fails to disclose that at and near stream crossings, efforts to prevent delivery of eroded sediment are not typically completely effective, as is the case with road crossings (Kattelman, 1996).

The DEIS fails to reasonably disclose that stream crossings by the pipeline will have several other impacts that will cause persistent increases in sediment delivery. An area 30 feet in width, centered over the pipeline will be kept free of deep-rooted vegetation and trees greater than 15 feet high (DEIS, p. 168). This recurrent removal of vegetation will likely have impacts akin to logging. Therefore, this repeated removal of vegetation will periodically elevate erosion and sediment delivery in a persistent fashion proximate to streams where sediment delivery will be significant.

This periodic removal of ecologically important vegetation will also prevent full recovery of bank stability at stream crossings, because trees and deep-rooted vegetation are critically important to bank stability (USFS et al., 1993; Rhodes et al., 1994). Decreased bank stability contributes to both stream sedimentation and channel widening. The persistent loss of bank stability associated with pipeline construction and maintenance at waterbodies will cause persistently elevated sediment delivery.

The DEIS also fails to reasonably disclose the magnitude of the effects on turbidity and suspended sediment caused by the construction of pipeline stream crossings. These impacts on

CRITFC DEIS COMMENTS

35

20071221-5145 PERC PDF (Unofficial) 12/21/2007 03:12:21 PM

turbidity and suspended sediment are typically acute, well in excess of regulatory limits, and at levels that significantly degrade aquatic habitat conditions and adversely affect fish and macroinvertebrate populations (Lévesque and Dubé, 2007), although the DEIS fails to adequately disclose these impacts.

The DEIS also fails to reasonably disclose that attempts to divert streams for construction of pipeline crossings fail with some frequency (Lévesque and Dubé, 2007). In so doing, the DEIS fails to reasonably disclose that these failures greatly increase sediment delivery and consequent impacts on streams. These fatal flaws must be corrected in the FEIS.

The DEIS has multiple defects regarding the impacts of sediment delivery from HDD crossings of waterbodies. Although the DEIS (p. 4-83) concedes there is the potential for "frac-out" with HDD crossings, resulting in releases of drilling mud to streams, the DEIS fails to reasonably disclose the likely magnitude and frequency of frac-out. The DEIS fails to reasonably disclose that frac-outs are likely to result in severe increases in sediment delivery and turbidity. While the DEIS concedes that frac-outs release drilling mud, it fails to clearly disclose that the release of drilling mud creates high turbidity. It also fails to disclose that the frac-outs will not only release drilling mud, but also disrupt unconsolidated channel substrate, which will also generate downstream sediment delivery and turbidity in addition to that from drilling mud. The DEIS also fails to disclose that frac-outs from HDD crossings are relatively common (Reid et al. 2002). These defects preclude reasonable disclosure of HDD impacts. These defects must be completely rectified in the FEIS in order to reasonably disclose the project's impacts on aquatic and watershed impacts.

• **Sediment Impacts of HDD Pipeline Crossings**

The DEIS also fails to disclose that HDD crossings will have other impacts that will significantly and persistently increase sediment delivery to streams. The DEIS fails to disclose the location of HDD entry and exit points and reasonably describe the associated ground-disturbing activities including their proximity to waterbodies. It is highly likely that the impacts to staging areas for HDD crossings will involve significant disturbances, including the clearing of vegetation (DEIS, p. 4-84) in close proximity to waterbodies. These impacts of HDD crossings will persistently and significantly elevate sediment delivery to streams. Notably, these impacts are not reasonably analyzed and disclosed in the DEIS. These defects must be thoroughly remedied in the FEIS.

The DEIS (4-84) concedes that locations, activities, and affected area that will be disturbed for the staging of HDD crossings have not been determined. Plainly, this precludes reasonable disclosure of the impacts of these crossings on sediment delivery and conditions that influence both aquatic habitat conditions and water quality. As previously discussed, location of these activities and their impacts must be determined, analyzed, and disclosed as part of the FEIS in order to reasonably determine the impacts on affected aquatic resources.

Importantly, the use of HDD to cross waterbodies is not required for any waterbody and may not occur (DEIS, p. 4-84). However, the DEIS fails to reasonably disclose the impacts of other stream crossing methods that may be used instead of HDD to cross streams. These other stream crossing methods are likely to have significant impacts that must be disclosed. The FEIS must also disclose the likelihood that waterbodies will be crossed by methods other than HDD and reasonably estimate and disclose their impacts on sediment delivery and consequent impact on affected aquatic resources.

• **Limited Effectiveness of Measures to Control Sediment Delivery Via Surface Erosion or Mass Failure**

CRITFC DEIS COMMENTS

36

20071221-5145 PERC PDF (Unofficial) 12/21/2007 03:12:21 PM

Another overarching problem is that the DEIS fails to reasonably disclose the limited effectiveness of measures to control erosion and sediment delivery to streams from pipeline construction and operation. This problem must be corrected. Reasonable disclosure of impacts requires more than the listing of measures and arbitrary assumptions regarding their efficacy. The FEIS must take a hard look at the available scientific information regarding the limits of these measures' effectiveness, disclose these limits, and factor it into a credible analysis of the effect of pipeline construction and maintenance on sediment delivery and its consequent impacts to aquatic resources.

The DEIS includes no adequate analysis of the likely effects of pipeline construction and operation on sediment delivery to streams via mass failures. Although the DEIS (4-169) states that "Most of the unstable slopes near sensitive waterbodies would be crossed by the HDD construction method" this may not actually be the case, because HDD crossing of these slopes is not required and may not occur, as the DEIS (p. 4-84). Further, the DEIS provides no reasonable analysis that HDD crossings do not contribute to slope instability. Although the DEIS (4-169) asserts that there are no other locations, besides those that are initially assumed to be crossed by HDD, where the pipeline would cross an unstable slope within 200 feet upslope of a waterbody, mass failures from unstable slopes frequently travel much farther than 200 feet. Plainly, the DEIS has not taken a reasonably hard look at the potential for pipeline activities to elevate sediment delivery to streams via mass failure. This must be rectified.

- **Cumulative Impacts to Sediment Delivery**

Another major and severe defect in the DEIS is that it fails to reasonably estimate the cumulative magnitude and persistence of sediment delivery to streams from the combined impacts of pipeline construction and maintenance. This is tractable and has been part of many EISs involving land disturbing activities affecting water quality and imperiled fish populations. This failure must be rectified in the FEIS by reasonably estimating the total increase in sediment delivery to affected streams at the scale of both reaches and watersheds. In so doing, the FEIS must also disclose key uncertainties, potential sources of error in estimates, and their ramifications for water quality, fish habitat conditions and fish populations.

The DEIS also fails to reasonably disclose that the construction of multiple stream crossings by pipelines within a watershed has the potential for permanent cumulative effects on aquatic resources (Lévesque and Dubé, 2007). Persistent impacts from elevated sediment delivery are typical in degraded streams susceptible to sedimentation (Espinosa et al., 1997). Notably, the pipeline will cross multiple stream segments in watersheds with degraded streams, although this is not adequately disclosed in the DEIS.

All of the waterbodies that will be crossed by the pipeline drain into the Columbia River. Therefore, all of the pipeline crossings will cumulatively affect water quality and fish populations in the Columbia River. However, the DEIS fails to adequately assess these cumulative effects. The FEIS must rectify these significant flaws by adequately disclosing the cumulative effects of pipeline activities on sediment delivery based on a hard look at the total impacts at the multiple scales at which cumulative impacts will accrue.

- **Linkage of Sediment Impacts to Fish Habitat Conditions**

CRITFC DEIS COMMENTS

37

20071221-5145 PERC PDF (Unofficial) 12/21/2007 03:12:21 PM

The DEIS also fails to reasonably disclose the effects on aquatic habitats from elevated sediment delivery from pipeline construction and maintenance. Although it is not adequately disclosed in the DEIS, elevated sediment delivery has numerous adverse impacts on waterbodies and water quality, including: the loss of pool frequency, quality, and volume (USFS et al., 1993; Rhodes et al., 1994; Buffington et al., 2000); increased width-depth ratio (Richards, 1982); elevated levels of fine sediment in substrate (Rhodes et al., 1994; Waters, 1995); and elevated turbidity and suspended sediment (Waters, 1995). Notably, these impacts singly, but especially in concert, degrade aquatic habitats in ways that significantly reduce the survival and production of salmonids and other aquatic organisms (Meehan, 1991; Waters, 1995). Although wholly undisclosed in the DEIS, available research indicates that any increase of fine sediment harms steelhead trout production (Suttle et al., 2004).

Due to the nature of pipeline construction and maintenance, these impacts to water quality, fish habitat, and fish populations will accrue at multiple scales for multiple species. However, the DEIS fails to adequately disclose these impacts on these aquatic resources at ecologically relevant scales, including the watershed scale and at the scale of habitats used by the affected fish populations. These defects must be rectified in the FEIS.

The DEIS also fails to reasonably disclose that the elevated sediment delivery from pipeline construction and maintenance is likely to contribute to increased water temperatures. Scientific information amply indicates that impacts that elevate width-depth ratios of waterbodies contribute significantly to increases in water temperature (Beschta et al., 1987; Rhodes et al., 1994; McCullough, 1999; Bartholow, 2000) even in the absence of the loss of stream riparian cover density (Rhodes et al., 1994; Bartholow, 2000). The DEIS fails to adequately disclose this impact on water temperatures from elevated sediment delivery based on reasonable assessment of likely cumulative impacts, existing conditions, and available information. This is a significant defect because many streams affected by pipeline construction and maintenance are afflicted with water temperature problems and/or are listed as water quality limited for water temperature (e.g., DEIS, p. 4-63, 4-64). Water temperatures in the Columbia River do not meet water temperature standards (DEIS, p. 1-140). Figure 1 presents annual water temperature trends for the Columbia River at Tenasillahe Island, just downstream of Bradwood Landing. This shows that summertime temperatures are 5°C above the standards for Oregon and Washington and are at the incipient lethal level. Although it is feasible for salmonids to sound or to move to river margins to escape the high surface temperatures for those fish rearing in the estuary during the summer, deep water could subject the fish to dredging impingement and rearing in the margins could subject the fish to even higher temperatures. River margins are typically warmer than the mid-river flows. Margins are the preferred rearing habitats, but these are the most likely areas to be affected by warming impacts from the terminal or pipeline (Dauble 2000). In the Snake River, fall Chinook preferentially use the river margin for rearing until temperatures reach about 18-20°C, after which they move to mid-river (USACE 2002). Actions that make river margins warmer could reduce the effective rearing capability of margins. Food availability is lower in mid-river than in margins.

The Columbia River will be cumulatively affected by temperature impacts in its tributaries. Therefore, the DEIS clearly fails to reasonably disclose an important impact from sediment delivery from the pipeline construction and maintenance. This must be thoroughly rectified in the FEIS.

Hydrologic and Wetland Impacts of Pipeline Construction and Maintenance.

The DEIS does not take a reasonably hard look at the total hydrologic impacts of pipeline construction and maintenance. For instance, the DEIS fails to reasonably disclose the total amount of

CRITFC DEIS COMMENTS

38

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

soil compaction associated with pipeline activities in wetlands and within 300 feet of streams. This is significant because soil compaction alters soil hydrologic processes, including infiltration, water holding capacity, surface runoff, and surface water interactions with ground water. These all influence the functionality of wetlands, because the ability of wetlands to absorb, store, and release water is one of their key ecological features. These flaws in the DEIS must be rectified in the FEIS, by disclosing not only these impacts but also their consequences for wetland and stream hydrology.

The DEIS also fails to adequately disclose the persistence of impacts from compaction. Under most conditions, at least 50-80 years are required for recovery from soil compaction in soils with lower clay content (Beschta et al., 2004). Wetland soils typically have higher levels of clays, significantly extending the time needed for recovery from compaction. There is almost no potential for mechanical restoration of compaction in saturated soils.

The DEIS fails to adequately disclose the magnitude, persistence and ramifications of pipeline construction on other impacts to the hydrology of wetlands and riverine areas. The pipeline will cause a permanent loss of the ability of soil to absorb and store water, because the pipeline is impermeable. Based on the pipeline length and diameter specifications in the DEIS, the pipeline itself will result in the permanent loss of about 225,374 cubic feet of water storage capacity in affected soils, which includes soils in wetlands and riparian areas. This obvious and enduring hydrologic impact of the pipeline will persist for as long as the pipeline is in place, although this is not adequately disclosed in the DEIS.

LWD, Stream Shade, and Water Temperature and Consequent Impacts on Fish Populations and Fish Habitat

- **Cumulative Impacts of Pipeline Construction and Maintenance**

In several ways, the DEIS does not reasonably disclose the many impacts of the pipeline maintenance and construction on elements and processes critical to fish habitat and water quality. One of the prime problems on this front is that the DEIS fails to disclose the extent, location, and proximity of all areas that will be disturbed near waterbodies that will reduce stream shade and LWD recruitment. The DEIS also fails to disclose the amount of stream shade that will be removed by pipeline activities at the scale of reaches, watersheds, and fish populations that use affected streams. Similarly it also fails to reasonably estimate the amount of LWD lost due to pipeline construction and maintenance at ecologically meaningful scales including at the scales of reaches, watersheds, and fish populations that use affected streams. These problems are compounded by the failure to assess these impacts within the context of the existing condition of LWD and stream shade.

Such an analysis is necessary for several reasons. First, it is necessary to reasonably determine and disclose impacts at the watershed scale. Second, it is needed in order to determine impacts to the various fish populations that inhabit the affected watersheds. Third, the DEIS (e.g., pp. 2-27, 4-95) repeatedly asserts that the applicant purportedly aims for the project to have an overall environmental benefit to the lower Columbia ecosystem. In order to reasonably assess the veracity of this claim, it is critical that all of the negative cumulative impacts of all aspects of the project and their spatial distribution must be fully determined and disclosed. Notably, because the negative cumulative impacts of the project have not been adequately determined in the DEIS, FERC has no basis for asserting that the project meets this purported goal. Therefore, it is critical that these defects be remedied in the FEIS.

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

- **Thermal Impacts on Rivers and Streams**

p. 4.62. *The portion of the Columbia River between CRMs 35 and 98 has been on ODEQ's 303(d) water quality-limited list for temperature (summer only) since 1998, in addition to exceeding total maximum daily loads (TMDL) for arsenic, dichlorodiphenylchloroethylene (DDE), and PCBs year-round. The Clatskanie River is listed for dissolved oxygen levels, fecal coliform, and temperature.*

p. 4.63. *Cameron Creek, Abernathy Creek, Germany Creek, Tributary 5 to Coal Creek, Coal Creek, and Ostrander Creek are listed for temperature variations outside the water quality standards. A discussion of the potential impacts on waterbodies that would be crossed by the proposed pipeline route is provided in section 4.3.2.4.*

It is anticipated that there will be a total of 94 waterbody crossings (Table 4.3.2.4) by the pipeline with extensive travel of the pipeline through wetlands on the Oregon side of the river. Westport, McLean, Uncle Tom, Larson Slough, Whiskey Joe, Ludviksen Slough, Kelli, Randa, Beaver, and Dobbins Sloughs will all be significantly impacted by trenching and removal of native vegetation. Some of these sloughs are listed as perennial and connected to the river. Others are listed as non-fish-bearing and intermittent. It is unclear what their connection is to the river and their potential for use by salmon for rearing. Restoration of use by the system of sloughs would be an appropriate additional increment of mitigation. A total of 98 acres of disturbed land in the wetlands is envisioned. The potential for disruption of subsurface flow direction and drainage through the sloughs has not been significantly considered. Sediment and compaction impacts of heavy machinery operating in these areas have not been considered. Compaction itself could impair the throughflow of water for decades. Even though the sloughs specifically have not been identified as water quality limited, the Columbia River is listed for temperature. Its river margin habitats are the most likely areas to experience elevated temperatures. For this reason, temperature impacts from all pipeline construction should be evaluated for local impacts in rearing areas and not by simply averaging on a flow-temperature weighted basis the runoff from project areas with the entire Columbia River flow. Because these marginal areas are also essential as rearing areas for salmon smolts from the entire Columbia River upstream of Bradwood, it is essential to disclose the impacts of the pipeline in these habitats.

Probably the most egregious aspect of trenching a pipeline through the numerous sloughs on the Oregon side of the river, followed by pouring concrete into the trench to hold down the pipeline, is that future restoration options for these sloughs would be foregone forever. Greater than 60% of historic wetlands have been disconnected from the estuary by construction of tide gates and building of levees. This type of past action degraded the condition of the sloughs and removed their connectivity with the estuary. There is enormous potential for improving salmon production in the entire Columbia River by improving the rearing capability in these types of wetlands. It is highly probable that placement of the pipeline in these sloughs would be used in the future as justification for never restoring these lands, should they become available. This is far too great a price to pay. The DEIS fails to explore the critical value of these sloughs and the long term loss to the Columbia River ecosystem's restoration by pipeline construction.

The right-of-way for the pipeline will create a 100-ft wide clearcut swath. Within this corridor, a 30-ft path centered on the pipeline will never be allowed to revegetate with trees taller than 15 ft. At stream crossings, a stream buffer of 25 ft would be allowed to regrow, but a buffer of this small extent is insufficient to reduce sediment and temperature impacts from vegetation removal in the streamside zone. Numerous studies indicate that buffers of ≤ 25 ft are insufficient to prevent degradation of aquatic resources (e.g., Knutson and Naef 1997).

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

The means of keeping vegetation from regrowing along the pipeline has not been discussed. If herbicides are planned for keeping trees from becoming re-established, the potential impairment to aquatic resources could be severe. The current temperature regimes of any of the streams being crossed or paralleled by the pipeline have not been presented. Likewise, the impact of temperature increases that can be expected from riparian clearcuts along the affected streams has not been calculated.

Even if the stream crossing method employed is HDD, the requirement to remove all riparian vegetation still exists, which will cause localized impacts to stream heating and sedimentation.

It is expected that there would be 17 waterbodies crossed by the pipeline using the HDD method, which can require a very large staging area (p. 4-84). In addition, 6 waterbodies would be crossed with the bore method. All others are planned for open trenching. There is some likelihood that if a decision is made that the HDD method or bore method is not feasible, the trenching method would be used. The impacts of the various methods obviously vary substantially. Given the uncertainty about which method actually will be used, disclosure of impact should reveal the impacts of all methods potentially employed. Because there is no requirement that any specific method should be used, it should be considered likely that other methods would actually be implemented in the field.

p. 4-85. In addition to using the HDD or bore methods for crossing waterbodies, NorthernStar also would use an open-cut technique for waterbody crossings. Clearing and grading of streambanks, in-stream trenching, backfilling, and trench dewatering could affect surface water quality through increased sedimentation, increased turbidity, decreased dissolved oxygen concentrations, and stream warming. A majority of the open-cut crossings would use a standard dry-trench method including either the dam and pump or flume method.

The impacts of the open-cut construction method on the minor intermittent and perennial streams along the pipeline routes would generally be localized and short term. Clearing, grading, and trenching within and adjacent to these streams would have the greatest effect on water quality. Clearing of trees and vegetation in and around streams could lead to an increase in water temperature. Sediments would be resuspended by in-stream construction activities or by erosion of cleared stream banks and riparian areas. Turbidity resulting from the resuspended sediments could reduce light penetration and the corresponding photosynthetic oxygen production. Resuspension of deposited organic material and inorganic sediments could cause an increase in consumption of biological and chemical oxygen, decreasing available dissolved oxygen. To minimize impacts on surface waters, NorthernStar would implement its pipeline ESC Plan for Oregon and its SWPPP for Washington as well as our Procedures.

The list of potential impacts from the various methods of constructing the pipeline is extensive, but this does not really constitute a disclosure of impacts. The commentary provides only the most general description of impacts. It offers no quantitative assessment of temperature impacts or sediment delivery estimates. In addition, it does not indicate which fish species are at risk in the affected streams, what their current condition is, the current condition of their habitat, or what the impact would be of changes in their habitat condition. For example, many of the streams affected by the pipeline are on the 303(d) list for water quality impairment. While temperature is a common type of impairment, no data on existing temperatures are given, no estimate of the increase in water temperature due to activities, or impact on fish populations.

- **Thermal Impacts of Pipeline**

Pipelines will be installed across streams using either the HDD, boring, or trenching/cofferdam approaches and 30-m clearcuts will be implemented at each crossing. This will result in cumulative opening of canopy on the affected stream systems. Because it is the intent of the project not to revegetate the sites with trees that could restore shade, this impact will be a permanent level of stream

CRITFC DEIS COMMENTS

41

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

warming. NorthernStar plans to simply employ BMPs as a means to supposedly avoid all impacts of pipeline crossing (p.13. NorthernStar Mitigation Plan, Aug. 1, 2007). There is no indication what these BMPs consist of or how the removal of shading vegetation will be mitigated.

The rate of stream heating on a linear basis has been reported as between 0.7°C/100 m in SE Alaska to 15.8°C/100 m in the Oregon Cascades (Beschta et al. 1987). Moore et al. (2005) indicated that the literature documents downstream warming of 7°C/46 m in Oregon (Brown et al. 1971), and 2°C/50 m, 1.4°C/30 m, and 0.4°C/20 m (Herunter et al. 2003) in various cross-channel right-of-ways. For clearcuts of various dimensions, stream temperature increases have ranged from 0.5 to 11.6°C (Beschta et al. 1987, Moore et al. 2005). Despite arguments often made by the timber industry that streams cool rapidly when they pass into shaded reaches, this is not necessarily the case (Beschta et al. 1987, Moore et al. 2005, SER 2000, NOAA 2005). This means that each increment of warming from the combined road, logging, utility, or pipeline corridor crossings in a watershed produces a further degradation of water quality.

Several wetlands and stream crossings located on the Wauna Mill property will be temporarily disturbed due to trenching to install the Pipeline. (p.61. NorthernStar Mitigation Plan, Aug. 1, 2007).

Although avoidance and minimization procedures are described in Table 1-2 (Avoidance and Minimization Actions for Bradwood Landing Project on p.13. of the NorthernStar Mitigation Plan, Aug. 1, 2007) for the HDD and boring methods, the stream crossings using the trenching method (such as noted for the wetlands and streams on the Wauna property above) do not have any minimization procedures noted. Likewise, there are no pre-project baseline conditions or post-project restoration conditions specified. This is a significant oversight. All that is indicated that may refer to the use of trenching (although it is not specifically stated) is: *Use BMPs for crossings where boring is not feasible to minimize effects on salmonids and other aquatic organisms; restore habitat features* (p.13. of the NorthernStar Mitigation Plan, Aug. 1, 2007). Presumably if boring is not feasible, trenching would be used. The BMPs are not specified, which may simply equate to "try to resist mucking it up as much as you can." BMPs to protect against effects of trenching appear to consist only of use of hay bales and silt fencing. There needs to be a set of detailed BMPs for there to be any assurance that impacts will be restricted to some known level. These BMPs should have some documentation of known effectiveness. This information is totally lacking.

p. 4-78. The proposed pipeline route would result in 94 waterbody crossings in Oregon and Washington. Of these, 65 are located in Oregon and 28 are located in Washington; the remaining waterbody is the Columbia River, which is located in both states. These waterbodies and their proposed crossing methods are listed in table 4.3.2-4.

With a total of 65 water crossings in Oregon and 28 in Washington, the cumulative effect of thermal and sediment impacts to sensitive streams and wetlands will be large. Several of these streams are listed for temperature and/or sediment impairments. It is not discussed how further impacts to these streams will be mitigated. Even the HDD method applies only to the stream channel itself. Riparian trees will be cleared outside the channel boundaries, opening up the sideslopes to additional stream heating and sediment input. At a scale of 1:24K it is easy to count at least 31 tributaries that will be crossed in Washington alone. Some tributaries are paralleled for significant length which would have even greater riparian effects that are not described. Even so, the number of smaller order tributaries would be increased significantly if the analysis were done at a larger scale. This could magnify the true extent of the impact significantly.

Impacts of Terminal Construction and Operation on Hunt Creek and the Columbia River

CRITFC DEIS COMMENTS

42

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

- **Impacts at Hunt Creek**

p. 4-9. *Debris flows or landslides initiated within the Hunt Creek drainage would proceed northward through the wetlands and mitigation areas west of the terminal and could not reach the terminal facilities.*

p. 2-27. *NorthernStar would also preserve and enhance about 62 acres at the mouth of Hunt Creek within the 411-acre parcel it controls at the Bradwood Landing terminal site as an additional wetland and habitat mitigation site. The compensatory mitigation sites were identified only after all other forms of impact mitigation (i.e., avoidance, minimization, rectification, and reduction) were considered and, when appropriate, implemented. In developing these sites, it was NorthernStar's intent to provide an overall net benefit to the environment of the lower Columbia River ecosystem. The locations of the sites are illustrated on figure 2.1.5-1, and they are described in greater detail in sections 4.4.1 and 4.5.*

Although it may be NorthernStar's intent to provide a net benefit to habitat of the lower Columbia River estuary, it is unclear what extent of benefit is actually targeted. Targeting a benefit that is simply equal to the value of the habitat lost is very risky. First, there is no concept that the FEIS has accurately identified the values of habitats being impaired and lost. The extent of use by various species is revealed only in the crudest manner. It appears that very little of value may be developed at the mouth of Hunt Creek that does not already exist. Further, there are more reasons to believe that ongoing activity at the terminal will compromise the habitat values present in this location. Hunt Creek is a significant natal stream for lower Columbia River coho and coastal cutthroat.

p. 2-41. *An existing PWR line runs through the proposed LNG terminal site. NorthernStar would need to remove a 4,200-foot-long portion of the existing tracks and relocate the railroad up to 250 feet south of its current alignment, still within the parcel controlled by NorthernStar. The right-of-way for the new railroad alignment would be 100 feet wide (i.e., 50 feet on each side of the centerline), consistent with the current right-of-way. Existing or new ballast would be moved or placed in the new right-of-way location and old tracks would be moved or replaced by new tracks. An undisturbed vegetation buffer zone would be maintained between the railroad realignment construction activities and the edge of Hunt Creek that would be at least 30 feet wide. The railroad line is in service, but not currently in use, which would allow for the possibility of delivering construction materials for the project by train. The extent of potential habitat damage focused at Hunt Creek is not confined to the terminal area.*

Placing the rail line within 30 feet of Hunt Creek would be a source of permanent and continuing degradation to the stream. Buffers of only 30 feet are not sufficient as a means to reduce solar radiation and stream heating, reduce sediment delivery downslope to the stream, or to protect the microclimate of the stream (Beschta et al. 1987, Moore et al. (2005), Krutson and Naef 1997). The railroad has not been in use, so it is not clear why this railroad would be restored at all except for purposes of supplying the terminal only during construction. Damage caused to Hunt Creek by development of this needless rail line cannot be justified.

p. 4-74-75. *During construction, the existing railroad line would be rerouted and would parallel Hunt Creek for approximately 2,000 feet. For most of this length, the creek and the edge of the railroad right-of-way would be between 50 and 400 feet apart. Hunt Creek would not be directly affected by railroad construction; however, for about 50 feet, the edge of the railroad right-of-way and Hunt Creek would be less than 50 feet apart. The railroad tracks would occupy approximately 22 feet at the center of the 100-foot-wide railroad right-of-way, and would have approximately 5-foot-wide ditches maintained along both sides of the railroad tracks. An undisturbed vegetated buffer of at least 30 feet would be maintained between the railroad tracks and the creek. NorthernStar's terminal ESC Plan describes measures that would be taken to prevent railroad bed ballast, other construction materials, and eroded soil from entering Hunt Creek during construction.*

Railroad corridors along stream channels create conditions whereby loss of riparian vegetation significantly contributes to stream habitat deterioration. Reduced canopy will increase solar radiation

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

inputs. Steep hillslopes from the railway corridor will increase the sediment transport to the channel. It will be virtually impossible to prevent the mobilization of these sediments during and after construction. This railway should not be reconstructed. If needed at all it should not be a new source of impact to Hunt Creek, but should be kept out of this drainage.

p. 2-27. *NorthernStar would also preserve and enhance about 62 acres at the mouth of Hunt Creek within the 411-acre parcel it controls at the Bradwood Landing terminal site as an additional wetland and habitat mitigation site.*

The terminal construction area butts up directly adjacent to Hunt Creek (p. 2-34). It is not possible to conceive how Hunt Creek wetland areas can be protected or enhanced when the terminal encroaches so dramatically on the stream. Given the Clifton Road traffic, railroad line construction along Hunt Creek, ship wake disturbance, dredging, powerline construction, maintenance of the power line 100-ft corridor cleared of vegetation, maintaining any natural qualities of Hunt Creek is difficult to conceive and is devoid of technical support in the EIS. It appears that this coho and coastal cutthroat habitat will simply be a sacrifice zone. The cumulative impact of all actions (e.g., solar loading, sediment loading, loss of LWD) on Hunt Creek were not disclosed.

p. 4-112. *NorthernStar's railroad right-of-way revegetation plan consists of two vegetative zones. The width of the zones would be variable, depending on the distance from the railroad tracks to Hunt Creek. The majority of the planting zone would be vegetated with low-growing herbaceous species in order to maximize visibility and minimize fire fuel. Low-growing herbaceous species, including lupine species and native grass species, would have a mature height less than 5 feet. Where the railroad right-of-way approaches Hunt Creek, near the center of the rail realignment, upland shrubs would be installed. Upland shrubs would have a mature height of 10 feet and greater.*

The railway revegetation plan along Hunt Creek emphasizes only low-growing herbs and short shrubs. Mature trees that have a chance of providing shade to Hunt Creek are not considered. This would likely result in warming of Hunt Creek or maintenance of already warm conditions. In addition, bank stability and erosion control would likely be significantly greater with tree planting than merely shrubs and grasses.

- **The DEIS Fails to Reasonably Assess the Cumulative Effects of Combined Project Impacts of the Terminal Infrastructure on Water Quality and Fish Habitat**

The various aspects of the project will have numerous negative impacts that will cumulatively affect water quality and aquatic habitats in Hunt Creek and the Columbia River. These impacts are not reasonably assessed and disclosed in the DEIS. These activities include work on existing transportation corridors, dredging, deposition of dredge spoils, and the construction and maintenance of a power line, railroad re-alignment, and the terminal. These activities will have numerous impacts including the removal of vegetation, loss of LWD, removal of stream shade, loss of bank stability, alteration of groundwater-surface interactions due to soil compaction, elevated sediment delivery, and loss of thermal regulation. However, the DEIS fails to adequately disclose these cumulative impacts.

The defects on this front are many. As previously discussed the DEIS fails to disclose all of the following aspects of all project activities⁸ that will occur within at least 300 feet upslope of the

⁸ At a minimum, these aspects should include all areas that are subject to heavy machinery operation, soil compaction, vegetation removal, grading, filling, and/or excavation, including the construction, operation, and maintenance of the terminal, pipeline, railroad alignment, roads and bridges, and powerline.

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

Columbia River and all Hunt Creek all tributaries, including intermittent channels and those that do not provide fish habitat:

1. the location and area of vegetation removal and soil disturbance, including soil compaction;
2. the type and amount of vegetation removed;
3. the nature and degree of soil impacts, including compaction, removal of soil cover, and alteration of soil properties;
4. the distance to the nearest channel or waterbody;
5. the type of activity;
6. activity duration and expected season(s) of occurrence;
7. spatial connectivity of the nearest channel/waterbody to fish habitat and the fish populations using the habitats;

This information must be factored into disclosure of the project's impacts on aquatic resources, including all essential fish habitat attributes (LWD, substrate, channel morphology, etc), the survival and production of fish populations, channel erosion, bank stability, sediment delivery, and all affected aspects of water quality in Hunt Creek and the Columbia River.

This problem is compounded by the DEIS's failure to reasonably disclose the very limited effectiveness of many measures touted to reduce impacts. For instance, the DEIS states that various widths of vegetation between project activities and Hunt Creek and the Columbia will be maintained undisturbed, allowed to revegetate, and/or replanted after activities. However, the DEIS fails to reasonably disclose that these widths are inadequate to prevent degradation or maintain unimpaired riparian processes.

As a specific example, the DEIS states that an "...undisturbed vegetation buffer zone would be maintained between the railroad realignment construction activities and the edge of Hunt Creek that would be at least 30 feet wide." However, the DEIS fails to reasonably disclose that available information amply indicates that a 30 foot wide buffer of undisturbed vegetation will not prevent degradation from elevated sediment delivery from re-alignment construction, the loss of LWD, thermal regulation by riparian vegetation, and many other impacts. The DEIS also fails to reasonably disclose that this width of undisturbed vegetation is inadequate to maintain unimpaired riparian processes vital to water quality and fish habitat. It also fails to adequately disclose that the loss of riparian vegetation and its functions due to the railroad re-alignment measure will permanently maintain degradation of water quality and fish habitat in Hunt Creek, and downstream in the Columbia River.

The foregoing is but one example of the DEIS's failure to reasonably disclose how the project's impacts associated with the terminal's infrastructure⁹ will cumulatively and permanently degrade riparian conditions and functions essential to the maintenance of water quality and aquatic habitat in Hunt Creek and the Columbia River. These defects must be rectified by analyzing and disclosing the magnitude, persistence, and consequences of the impacts of construction and maintenance of terminal infrastructure on riparian functions in Hunt Creek and the Columbia River. At a minimum, these functions and their consequences must include: LWD supply, ability to prevent sediment delivery from upslope sources, stream shade, stream thermal regulation, and bank stability.

The DEIS also failed to reasonably disclose all important impacts associated with the construction and operation of the terminal infrastructure at the scale of the Hunt Creek watershed. For

⁹ In these comments, "terminal infrastructure" includes all aspects of the terminal, including the areas to be dredged, areas affected by dredge spoils, the terminal, power line, railroad, and transportation corridors.

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

instance, the DEIS does not disclose the amount of compaction and vegetation removal at the scale of the Hunt Creek watershed. This is critical because soil compaction reduces soil permeability. All areas of reduced permeability, and not just those that are totally impermeable, contribute to increasing peak streamflows and reducing low flows (Booth, 2002). The DEIS fails to reasonably disclose that hydrologically and biologically, there are no negligible amounts of clearing or watershed imperviousness (Booth et al., 2002). Similarly, the DEIS includes no adequate assessment in cumulative alterations in low flows and high flows that will be caused by all project activities in Hunt Creek, although clearing, compaction, and impervious surfaces will alter low and high flows in affected streams (Booth et al., 2002; Booth et al., 2004).

• Assessments are Piecemeal and Cursory and Lacking in Cumulative Effects Analysis

Similar to the defects related to pipeline impacts, the DEIS fails to reasonably disclose the cumulative effects of the construction and operation of terminal infrastructure on sediment delivery to Hunt Creek and the Columbia River and its consequent impacts, including those on turbidity levels, channel width, pool conditions, substrate conditions, and macroinvertebrate populations. This is a critical defect because the project will persistently and significantly elevate sediment delivery to Hunt Creek and the Columbia River.

Instead of quantitatively and cumulatively assessing the impacts of the construction and operation of sediment delivery, the DEIS instead only provides piecemeal qualitative assessments of the impacts of individual activities such as dredging, the placement of dredge spoils, power line construction and maintenance, bridge reconstruction. This is highly inadequate for disclosing the cumulative impacts on sediment delivery and consequent effects.

First, the piecemeal assessments are cursory and are not based on taking a hard look at available information. For instance, the DEIS asserts that most stormwater runoff from the terminal is expected to infiltrate on site due to existing infiltration rates. However, this is not a reasonable assumption, because grading and compaction will greatly reduce infiltration rates. Surface sealing of bare soil surfaces is likely to further reduce infiltration rates. It is also likely that during and after prolonged sequences of larger storms that are common to the areas, soils will be persistently saturated and unable to absorb water via infiltration. Therefore, the DEIS fails to adequately consider and disclose these impacts. In so doing, the DEIS fails to disclose the impacts of stormwater runoff from terminal construction and operation on sediment delivery.

Dredging at the Terminal and In-River

• Dredging Impacts at the Terminal

The DEIS analysis of dredging impacts on turbidity and suspended sediment is cursory and inadequate. The DEIS's analysis of this impact is based on the assumption that suction dredging will be the only method used, but other methods may be needed in order to excavate the area proposed for dredging. These methods have greater impacts than the hydraulic dredging analyzed in the DEIS. The DEIS failed to reasonably assess the likelihood and the effects of the use of other methods besides suction dredging for channel excavation. In so doing, the DEIS failed to reasonably assess the likely impacts of dredging on sediment delivery and turbidity in the Columbia River.

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

Another obvious problem with the analysis of dredging effects on turbidity and sedimentation is that the DEIS failed to take a hard look at the assumptions and results of the modeling of changes in suspended sediment from dredging. The DEIS (p. 4-69, 4-70) indicates that only spillage from dredging was considered in modeling the effect of dredging on turbidity and suspended sediment. In contrast, several other factors are likely to contribute to turbidity elevation, including disruption, mobilization, and suspension of sediments disturbed during dredging. The DEIS also fails to adequately assess the veracity of modeling assumptions and sediment size characterization. The modeling was clearly based on assumed spillage rate that may not be reasonable or reflect actual spillage during dredging.

Although the DEIS asserts that modeling of dredging impacts on suspended sediment indicates that there is likely a limited effect, the DEIS fails to reasonably assess the likely accuracy of the analysis. Uncalibrated models that are based on limited information often are more than an order of magnitude in error, although this is not reasonably disclosed in the DEIS.

An additional problem with the analysis of dredging impacts is that the DEIS fails to adequately and quantitatively assess erosion, sediment delivery, and turbidity impacts from the deposition of dredge spoils. In fact, the DEIS (p. 4-71) concedes that no effort has been made to estimate erosion, sediment delivery and resulting turbidity from the 300,000 to 350,000 cubic yards of dredged material that would be placed at the Wahkiakum County Sand Pit site. In so doing, the DEIS clearly fails to assess a significant source of sediment delivery and turbidity that will combine with other sources of elevated turbidity in the Columbia River caused by the construction and operation of terminal infrastructure.

Second, the DEIS's qualitative assessment of individual impacts do not reasonably account for the limited effectiveness of measures aimed at somewhat limiting the project's impacts on sediment delivery. Third, the qualitative nature of the piecemeal evaluations of individual impacts precludes making a quantitative cumulative assessment of the total impact on sediment delivery from all aspects of the construction and operation of terminal infrastructure, which is central to determining cumulative impacts.

In order to reasonably assess the impacts of the construction and operation of terminal infrastructure, these manifold problems in the DEIS must be remedied. Sediment delivery strongly influences water quality and fish habitats. It will also be profoundly affected by the project. Therefore, the FEIS must include an adequate estimate of the total increase in sediment delivery and its temporal distribution in Hunt Creek and the Columbia River caused by the construction and operation of terminal infrastructure. As part of this analysis, the FEIS must also disclose key uncertainties, potential sources of error in estimates, and their ramifications for water quality, fish habitat conditions and fish populations.

The foregoing is not only necessary for the required disclosure of the cumulative effects of the project. It is also necessary in order to reasonably evaluate the proposition that the project could have overall benefit for the lower Columbia River.

The foregoing analysis is also necessary in order to reasonably evaluate the effects of proposed mitigation measures. The DEIS asserts that the preservation of Hunt Creek will be part of the project's attempts to mitigate significant environmental damage. However, if the project's cumulative impacts persistently degrade Hunt Creek, this clearly reduces the potential efficacy of using Hunt Creek as mitigation for ecological damage. Therefore, these defects in the DEIS must be rectified in the FEIS

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

by fully analyzing and disclosing all of the likely cumulative impacts of project activities on aquatic, riparian, and watershed resources in riparian conditions Hunt Creek.

p. ES-2. *Modeling conducted by NorthernStar indicates that dredging for the maneuvering area would have no significant changes on the flow or channel characteristics of Clifton Channel and only minor changes to the main navigation channel of the Columbia River.*

The sediments are primarily sand and would settle quickly. As a result, the size of the sediment plume would be very small and confined to an area immediately surrounding the dredging site.

Although it is claimed that the sediment dispersal from dredging and the action of cutterheads is confined to a mere few feet of the activity, the fact that most of the sediment is sand does not mean that sediments will not be carried as bedload into Clifton Channel after being mobilized. The amount of blasting of the bed needed to excavate sediment and bed volume in the 45 acres to be deepened is an unknown that could result in greater levels of sedimentation in the Clifton Channel. It does not appear that NorthernStar has conducted any tests of bed transport relative to flow and bed disturbance. This would be a more reliable means of determining the field behavior of sediments. Even if the majority of sediments are sand sized particles, finer sands and silts could comprise a substantial volume of material, even if it is present as a small percentage by volume. Deposition of dredged materials just upstream at Puget Island in nearshore areas could easily create sand wedges that would act as a focus for bed scour and transport downstream to the shipping channel or to the Clifton Channel.

• Dredging Impacts on Fish and Fish Habitat

The DEIS lacks any discussion or comparison of dredging impacts on fish and fish habitat from other watersheds around the world. These are available in the literature and are discussed in Dodge (1989).

Elevated, but not extreme, levels of turbidity caused by dredging have been correlated with decreased juvenile survival by NMFS and others (Junge and Oakley 1970; Smith et al. 1997). The literature (Hardy and Allen 1980) notes that dredging can reduce turbidity as sediments sink into the navigation channel. This issue is not adequately addressed in the DEIS.

The DEIS fails to note that initial and maintenance dredging will cause reduction of water surface profiles and shoreline riparian areas in and below the proposed project area. Significant portions of sediment may sink into the deepened channel only to be removed by dredging out of the system. The DEIS does not adequately analyze what this impact could mean to existing riparian areas that are critical habitat for salmonids. Further, there should be annual mitigation requirements for existing and proposed maintenance dredging, but this is not addressed in the DEIS.

• Dredge Disposal Plan

The DEIS relies on inadequate studies and analyses of disposal impacts. The DEIS proposes an alternative that dumps dredge spoils back into the river. The impacts of this action have not been thoroughly assessed. Additional surveys should be conducted at the proposed site and included in the FEIS.

We believe that the applicant should conduct a small, pilot in-river disposal project to determine if the project has a demonstrable positive effect on fish habitat. The claim in the DEIS that in-river disposal enhances fish habitat is mere speculation. On the contrary, the EPA has noted that the

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

effects of such projects could negatively affect salmon. Among other problems, shallow water habitat can increase water temperatures by increasing solar heating of the shallow water benches. The result can both benefit warmwater fish that prey on salmon, while harming salmon, which are coldwater fish. In addition, sediment disposal in-river will decrease total dissolved oxygen concentrations critical to salmon and other anadromous fish.

Pipeline Right-of-Way Ambiguity

p. ES-3. The pipeline right-of-way would be restored and seeded after construction. Upland forest would be replanted with in-kind trees, except for a **30-foot-wide strip** over the pipeline centerline. Routine maintenance of a **10-foot-wide corridor** centered on the pipeline would keep that area in an herbaceous state. To minimize impacts from the potential spread of noxious weeds from the disturbed right-of-way, NorthernStar developed a Noxious Weed and Soil-borne Plant Disease Control Plan.

p. 2-35. In wetlands where the pipeline crossing would exceed 100 feet in length, NorthernStar proposes to use a **100-foot-wide construction right-of-way** to account for the slumping of saturated segregated spoil piles. NorthernStar would reduce the construction right-of-way to a width of 85 feet in wetlands where the crossing length is 100 feet or less. The 85-foot limitation on the construction right-of-way width would not apply to wetlands in actively cultivated or rotated cropland. Pipeline impacts on wetlands are further discussed in section 4.4.1.3. Following construction, a **50-foot-wide permanent right-of-way** would be retained for operation and maintenance of the pipeline. The typical right-of-way cross sections that NorthernStar would use for the pipeline route are provided in Appendix D.

p. 2-35. In addition to the construction right-of-way, NorthernStar would require temporary **extra workspace outside the standard construction right-of-way** at locations where additional excavation, soil placement requirements, or equipment management and staging would make it impracticable to carry out all construction operations within a **100-foot-wide corridor**. These would include feature (e.g., road, railroad, waterbody) crossings; areas with steep side slopes or severe terrain; areas requiring topsoil segregation; tie-ins to existing pipelines and laterals; HDD entry and exit points; and staging and fabrication areas for HDD pull sections. NorthernStar has identified **43 temporary extra workspaces** areas that are required for the project, affecting approximately **54.0 acres**.

p. 2-48. A **riparian buffer** would be left between the wetland and the upland construction areas except for the pipe trench itself and erosion control measures (e.g., silt fences, interceptor levees, and hay bale structures) would be installed and maintained to minimize sedimentation into the wetland. Trench plugs would be installed where necessary to prevent the unintentional draining of water from the wetland. After construction, forested wetlands would be replanted in-kind with trees, with the exception of the portion of the right-of-way within 5 feet of the pipeline (10 feet total), thereby minimizing the extent of disturbance. NorthernStar's proposed tree planting exceeds the revegetation requirements of the FERC staff's Plan and Procedures.

p. 2-49. After construction, forested wetlands would be replanted in-kind with trees, with the exception of the portion of the right-of-way within **5 feet of the pipeline (10 feet total)**, thereby minimizing the extent of disturbance. NorthernStar's proposed tree planting exceeds the revegetation requirements of the FERC staff's Plan and Procedures. The corridor centered on the pipeline would be planted with a native grass seed mix and maintained in an herbaceous state to facilitate maintenance and inspection. Wetlands might also be crossed using the HDD construction method described below.

p. 4-115. Maintenance of the entire right-of-way would occur no more than once every 3 years. However, to facilitate maintenance and inspection, NorthernStar may clear a **10-footwide corridor** centered on the pipeline annually.

p. 4-115. In upland forested areas, **permanent impacts would be greatest over the maintained portion of the right-of-way, totaling about 54 acres**. Upland forested communities would be replanted in-kind with trees, with the exception of the portion of the right-of-way within **15 feet of the pipeline (30 feet total)**, thereby minimizing the extent of disturbance. NorthernStar's proposed tree planting exceeds the revegetation requirements of the FERC

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

staff's Plan and Procedures. The **30-foot-wide corridor** centered on the pipeline would be planted with a native grass seed mix and maintained in an herbaceous state to facilitate maintenance and inspection.

p. 4-167. Clearing the right-of-way would remove shading vegetation from uplands and riparian areas, exposing the land and water to increased sunlight, resulting in both direct increases in water temperatures and indirect increases as water flows over the warmer land surface and eventually reaches the waterbody (Beschta and Taylor, 1988). The effects of water temperature on the life stages of salmonids have been extensively reviewed and are described in section 4.5.2.1. To mitigate these potential impacts, NorthernStar would allow a **corridor at least 25 feet wide**, as measured from the OHWM, to **permanently revegetate with native plant species across the entire construction right-of-way following construction**. However, to facilitate access for periodic pipeline corrosion/leak surveys, a corridor centered on the pipeline and up to **10 feet wide may be maintained in an herbaceous state**. NorthernStar's use of the HDD construction method to cross waterbodies would also limit impacts on riparian habitats.

p. 4-305. Following construction, a **50-foot-wide permanent right-of-way** would be maintained for operation and maintenance of the pipeline. The typical right-of-way cross sections that NorthernStar would use for the pipeline route are provided in Appendix D.

The rules for the pipeline corridor width are extremely variable throughout the document. It appears that during the construction phase the corridor will be 100 feet, although additional width is used temporarily as a site for storage of excavated soil. In addition, the corridor right of way varies from 85-120 ft, although the predominant widths are 100 and 120 ft (Appendix F). After construction, the right-of-way will be either 25 ft, 30 ft, or 50 ft. The width that will be mowed and kept in a permanently herbaceous state will be either 10 ft or 15 ft. It is not clear whether all trees will be cut in the construction corridor initially. This should be avoided to reduce impacts. The 25 to 50 ft corridor will be "allowed" to revegetate naturally, but it is not apparent that NorthernStar will actually replant trees where trees were removed, outside of the permanently herbaceous strip. The ambiguity in corridor widths and what will happen in them makes interpretation of impact and expected recovery uncertain. A riparian buffer is claimed to be left between the wetland and upland construction area (p. 2-48), but this doesn't really indicate that all trees in the corridor will not be removed. To claim that NorthernStar is planting more trees than FERC requires in replanting is no indication that NorthernStar is exceeding the needed restoration quality of wetlands. More useful would be to refer to what the state considers to be needed and what is required to prevent environmental damage. Even FERC's minimal "standard" was not described, so it is even more difficult to understand the level of protection being provided.

The entire disturbed right-of-way corridor is 424 acres or 0.663 mi² based on an average 100-ft wide corridor. If the corridor average width is 110 ft, the area would be 467 acres or 0.73 mi². Assuming that the corridor width is only 100 ft and only 15 ft width is kept permanently disturbed, the total disturbed area would be 63.6 acres. This differs from the FEIS estimate of 54 acres. Also, the initial disturbance on the entire corridor is more likely to be at least 467 acres, with removal of all trees. Even the trench width itself would vary from 15-25 ft wide (Appendix D). Heavy machinery would be operating along the trench and would significantly compact soils on at least 50% of the entire corridor width. No mitigation for the extreme, long-lasting effects of soils compaction in wetlands was described. This alone could significantly impair the throughflow of water to wetland habitats.

With a total of 94 water body crossings, a mean right-of-way diameter of 100 ft, and an assumed 200-ft mean width of riparian buffer (width perpendicular to streamflow; assumed by us as a conservative estimate of the effective riparian function because the DEIS does not reveal this extent of impact), the total area of riparian vegetation lost would be 86.3 acres. The EIS does not reveal the riparian buffer width that would be affected. Consequently, it is not possible to accurately determine

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

riparian impacts. The shade values or potential recruitable LWD of riparian buffers lost are not provided.

p. 4-88. The proposed pipeline would be operated and continuously monitored by a remote control center to be located at the LNG terminal. Operational activities with the potential to impact water quality would be limited to maintenance of the permanent right-of-way and repair of the pipeline. To minimize impacts on water quality and riparian vegetation, NorthernStar would allow a riparian buffer at least 25 feet wide, as measured from the waterbody's MHW mark, to permanently revegetate with native plant species across the entire right-of-way after construction is completed. However, trees greater than 15 feet tall, or deep-rooted shrubs that could damage the pipeline's protective coating, obscure periodic surveillance, or interfere with potential repairs, would not be allowed to grow within 15 feet of the pipeline. The frequency of the vegetation maintenance would depend upon the vegetation growth rate. This ongoing maintenance may have a discountable effect on stream temperature where large trees are not allowed to establish, and may reduce localized cover.

NorthernStar plans to allow a riparian buffer of ≥ 25 ft width to revegetate. This does not specify that all trees lost in construction of the pipeline outside the 15-ft buffer to each side of the pipeline would be replaced. Consequently, it appears that a massive loss in vegetation could occur. There are no provisions specified that failure of trees to become established would be followed by additional attempts to plant trees. A mitigation action specified in the paragraph above is to "limit" activities that have potential to impact water quality to the pipeline corridor. However, limiting impact does not indicate anything about how these impacts will be mitigated. The EIS claims that effects of stream temperature are discountable. However, this conclusion is not based upon analysis and is premature. Mitigation for stream warming at a site and cumulatively within a basin cannot be discounted by a mere allusion to a presumed minimal effect.

The extent of revegetation is very poorly described:

p. 2-48. The restored construction right-of-way would be revegetated in accordance with NorthernStar's pipeline ESC Plan for Oregon and SWPPP for Washington, FERC staff's Plan, other permit requirements, and site-specific landowner requests.

p. 4-46. About 51 percent (253.5 acres) of the proposed pipeline would cross soils with revegetation concerns.

The clearing and grading of soils with poor revegetation potential could result in a lack of adequate vegetation following construction and restoration of the right-of-way, which could lead to increased erosion, a reduction in wildlife habitat, and negative visual impacts.

p. 4-104. Monitoring of wetlands would be conducted for a minimum of 3 years post-construction to ensure the success of wetland revegetation. If revegetation is not successful after 3 years, a remedial revegetation plan would be developed and implemented.

p. 4-103. Forested wetlands would be replanted with in-kind wetland tree specimens, with the exception of the portion of the right-of-way within 5 feet of the pipeline (10 feet total), thereby minimizing the extent of disturbance. NorthernStar's proposed tree planting exceeds the revegetation requirements of the FERC staff's Procedures. The corridor centered on the pipeline would be planted with a native grass seed mix and maintained in an herbaceous state to facilitate maintenance and inspection.

If revegetation fails, monitoring in year 3 would be employed. This is described as monitoring of wetlands. Because much regrowth will require decades to occur, especially tree growth, a significantly longer monitoring plan is needed to assess revegetation. There is no natural potential vegetation standard employed. Vegetation communities would be compared with whatever happens to be nearby as a standard. This lowering of the bar for restoration is not one designed to make gains in habitat quality. Beyond the 3-year point it appears there will be no subsequent attempts to reestablish vegetation. It is not even clear that plant communities would replace what was lost in upland areas or

20071221-5145 FERC PDF (Unofficial) 12/21/2007 03:12:21 PM

what is considered to be the potential natural vegetation for the area. Even in wetland areas, one can only deduce that similar tree species would be planted as had pre-existed in the construction area, but there is no indication that original tree densities would be targeted. If FERC guidelines are so much less than what NorthernStar proposed, what assurance is there that NorthernStar could not later opt for FERC rules? It would benefit disclosure interests for FERC to describe its minimal set of guidelines to know how far NorthernStar practices could potentially be degraded and what the consequences of this would be at sensitive sites and cumulatively.

Washington, DC 20426

Re: Comments of the State of Oregon
Draft Environmental Impact Statement
Bradwood Landing LLC Docket No. CP06-366
Northern Star Energy LLC Docket Nos. CP06-366, CP06-376 and CP06-377

Dear Secretary Bose:

At my direction, State of Oregon natural resource agencies have been engaged in a review of the proposed Bradwood Landing Liquefied Natural Gas (LNG) import terminal and its associated pipeline. Oregon's comments on the Draft Environmental Impact Statement for this project are attached. My primary motivation for a detailed state review of this document is to ensure that state standards and concerns are addressed by the developer and by the Federal Energy Regulatory Commission.

As Governor of the State of Oregon, I do not support a statewide, categorical exclusion of LNG terminals from Oregon. Locating an LNG import terminal in Oregon, however, must be supported by a comprehensive review of all potential impacts of the facility in Oregon. That is the function of the Bradwood Landing DEIS. As more fully explained below and in the accompanying comments, the Bradwood Landing DEIS is incomplete and flawed in a number of respects.

Oregon has an effective system for siting large energy facilities that balances the need for new energy resources effectively with environmental protection and adequate safety standards. That siting process effectively involves all interested Oregon natural resource agencies in the review of any facility. As a result of Oregon's unified siting process, state natural resource agencies have attained a high level of expertise in evaluating applications and contributing not only to the analysis of the environmental impacts but also to the design and adoption of appropriate mitigation measures. In fact, Oregon was in the midst of reviewing an application for the Bradwood Landing facility under the state siting process when the Energy Policy Act of 2005 was enacted, effectively ending state-level review. As a result of this experience and expertise, Oregon is uniquely situated to provide comments on this proposed facility.

State Agencies

1

Secretary Bose
December 13, 2007
Page Two

The State retains permitting authority over LNG terminals in the areas of water quality, air quality, and coastal zone management, and in cases where state approval is needed for construction of terminals or appurtenant structures on state lands. In many instances, the DEIS is the best evidence about the applicant's plans for compliance with those federally delegated programs. In their comments, the Oregon agencies involved have identified deficiencies that present hurdles to the ultimate approval of the project by those agencies.

As the specific comments will reflect, many conclusions in the DEIS are founded on assertions and promises, not on sound science, comprehensive analysis and empirical facts. The Commission should not make a decision to license this LNG terminal on the inadequate environmental record currently before the Commission.

Comments sent to state agencies by Northern Star late in the comment period suggest that there is information contained in the administrative record or currently circulating for review that may address some of Oregon's concerns. Because that information is not contained in the DEIS, we are compelled to assert those concerns. It is well-established that the final EIS, as the foundation for the licensing decision by FERC, must be complete. Thus, any mitigation plan or other document that will be relied on by FERC to determine that the facility meets licensing criteria must be included in the DEIS and circulated for meaningful review before adoption of the final EIS. Furthermore, such plans and documents must be referenced in license conditions in the final decision.

As an example of the inadequacy of the DEIS, large portions of the mitigation for habitat, wetlands, archaeological impact, landside protection and emergency planning are still unknown. Indeed, many supporting documents for the licensing decision will be produced after the opportunity for comment on the DEIS has closed. This is a fundamental process flaw. We recommend delaying the Final Environmental Impact Statement (FEIS) until the design is finalized, mitigation plans with metrics are written, and emergency response protocols can be defined, and after interested parties have had an opportunity to comment on the efficacy of those plans. We further recommend that, when the FEIS is presented, it clearly presents the required information used to develop and articulate measurable project specific conditions that demonstrate how the facility would meet Oregon's standards. Agreements made outside the FERC licensing process cannot be considered durable and therefore do not provide adequate assurance that the facility will be constructed, operated, maintained, and decommissioned as required by Oregon's Energy Facility Siting standards.

Liquefied Natural Gas terminals also introduce a companion suite of issues associated with natural gas pipelines that carry LNG from terminals to service areas, sometimes at great distances. The social and environmental impacts of these pipelines are of as much concern to the State as the terminals themselves. Accordingly, Oregon agencies have also identified and evaluated the environmental and social impacts of these pipelines through federal and state permitting processes. Further, because pipeline companies who obtain a FERC license have the power of eminent domain, I have insisted that that power be used carefully and with the utmost respect for property

SA1-A

We disagree that the EIS is either inadequate or flawed because mitigation plans for archaeological resources have not been finalized. As stated in section 4.9.4, the process of complying with the NHPA cannot be completed until after the FERC issues its Order authorizing the project, which would allow NorthernStar to use the power of eminent domain to acquire a right-of-way easement over parcels of land where access was previously denied so that the cultural resources inventory could be finished. Once the survey is done, the FERC would determine if any historic properties would be adversely affected. If there would be no impacts on historic properties, no mitigation plans would be necessary. If historic properties would be adversely affected, the FERC would consult with the appropriate parties to resolve impacts, and treatment plans would be formulated. It is standard FERC practice to condition an Order so that the process of complying with the NHPA can be completed after an Order is issued but before construction is allowed to begin. Also see our response to comment FA2-22.

Page Three

rights that includes fair compensation and full mitigation of impacts to property owners, as well as recognition of the need to be responsive to citizens concerns and public requests for information and maps of these pipeline projects. I have recently communicated those expectations to pipeline project sponsors and will continue to monitor progress in this matter.

Northern Star has provided evidence that the proposed project will offer substantial economic benefits to the local community, including:

- Enhanced capacity for river commerce (new bar and river pilots, new tugs);
- Property tax revenue for Clatsop County and special districts (increase 92.4 percent);
- Construction jobs (331 per year for three years, 506 peak); and
- Operational jobs (50 FTE, average \$60K, 15 FTE security)

Those economic benefits must be balanced with the environmental impacts of the facility.

I highlight the following major concerns regarding the DEIS, which are addressed in more detail in the accompanying comments.

a. **The need for the facility has not been established and the alternative analysis is inadequate.** The DEIS does not adequately analyze market data and natural gas supply trends to support the claim by the developers that additional supplies of LNG are needed in the Pacific Northwest. Nor does the DEIS contain a comprehensive list of alternatives that include no action, energy conservation, expansion of existing infrastructure, and potential new sources of natural gas, including domestic, continental and offshore supplies.

b. **The DEIS needs to adequately reflect scientific information from geotechnical reports.** The state agencies have identified several instances where the DEIS provided incorrect technical statements and statements with no substantiating science. That failure undermines the credibility of the entire analysis.

c. **In many cases, the DEIS depends on assertions that mitigation will be provided, but the details of the mitigation are unknown.** For example, regarding mitigation for impacts to fish, although Northern Star has proposed to spend \$50 million over the 40 to 50 year life of the Bradwood Landing project on a Salmon Enhancement Initiative, the Initiative would be entirely voluntary (not regulatory), and its effectiveness is unknown. Similarly, the DEIS provides no clear compensatory mitigation plan for impacts from dredging or wharf construction activities.

d. **The proposed project would have adverse impacts on air and water quality in the Lower Columbia watershed.** Proposed dredging for the terminal, turning berth and pipeline will cause damage to watershed function, water quality and sensitive species and habitats, and those impacts have not been adequately evaluated or addressed in the DEIS. Supply ships and vaporizers will contribute air pollutants. Proposed mitigation measures are not sufficient to offset the damage that will be done, and cumulative impacts need to be thoroughly analyzed.

K-429

State Agencies

1

Secretary Bose
December 13, 2007
Page Four

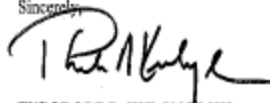

e. **The DEIS does not adequately recognize Oregon's role in emergency preparedness.** No enforceable commitment has been made for Emergency Response resources necessary to operate at the proposed facility, nor were safety and security impacts to the local communities adequately assessed. In addition, the DEIS does not recognize that the Oregon Department of Forestry (ODF) is an emergency responder to wildfires on private, rural and state owned lands, and that ODF needs to be consulted on emergency response planning.

f. **The DEIS does not contain mitigation recommendations requiring Northern Star to mitigate CO2 emissions and to provide financial assurance to retire the facility.** A detailed engineering estimate of site retirement costs should be required and assurances gained that those costs will be covered, before FERC issues a Final EIS. Without those assurances, Oregon has no protection against bankruptcy or abandonment of the facility.

In summary, I believe that the State of Oregon and the Commission must fairly address all the benefits and costs associated with LNG facilities and determine if LNG has a role as a "bridge" source of energy for Oregon and the Northwest. For the Commission to make LNG siting decisions in a vacuum, without the benefit of the best available information and scientific data, would do a huge disservice to the people of Oregon. Ultimately, the decision to site terminals requires the full engagement of the federal government, the state and the communities where facilities are proposed. But, as noted in paragraph four of this letter, Oregon holds authority in the important areas of air quality, water quality and coastal zone management. Only by working together through the siting, environmental assessment and permitting processes, with the benefit of a complete and substantial environmental impact statement, can we make sound decisions about the appropriateness of any proposed LNG terminal.

I look forward to your resolution of Oregon's concerns.

Sincerely,

THEODORE R. KULONOSKI
Governor

STATE OF OREGON COMMENTS ON BRADWOOD LANDING NATURAL GAS IMPORTATION TERMINAL DRAFT ENVIRONMENTAL IMPACT STATEMENT 12/18/2007

GENERAL COMMENTS

The Purpose and Need Analysis is Inadequate

- SA1-1 Oregon is disappointed with the level of detail in the document. Much of the Bradwood Landing draft environmental impact statement (DEIS) contains only general information and conclusions about environmental and resource effects. Specifically, the general nature of the Federal Energy Regulatory Commission (FERC or the Commission) review of the project "purpose and need" and related "alternatives" analysis is inadequate. The DEIS does not sufficiently describe the basis for determining the regional and national need for an LNG import terminal and pipeline project in this location or provide a clear set of objectives that provide a rational basis upon which need can be assessed.
- SA1-2 As a result, only general information about market demand for natural gas is included in the DEIS document. More importantly, there is no overall national or regional energy plan to guide the siting and construction of natural gas infrastructure that assures the economic and efficient provision of import terminal and pipeline facilities. Because of the absence of specific information documenting the need for terminal and pipeline facilities in this location and the Pacific Northwest and the FERC practice that relies on applicants to propose projects for case-by-case review, the DEIS does not adequately assess fundamental energy infrastructure planning issues. Such an approach could result in approval of several terminal and pipeline projects, each with significant environmental effects, that provide excess import terminal capacity, unnecessary pipeline infrastructure and unnecessary environmental effects. The public interest is best served by a meaningful analysis of need and alternatives.
- SA1-3 Currently, in Oregon, there are three active proposals for LNG import terminals and four active proposals for interstate pipeline projects. Although applicants understand that not all of the projects will be constructed, each is being pursued as if it will be constructed. The lack of specific guidance or planning policies at the federal level requires public and government agencies at all levels to devote resources to reviewing these projects, at a substantial cost.
- The DEIS concludes, without substantiation, that some alternatives are not feasible. The DEIS merely concludes that some alternatives do not meet the objectives of the Bradwood Landing project without assessing the validity of the stated objectives and that other alternatives do not provide significant environmental advantages without comparing specific economic and environmental costs and benefits. Without some commonly accepted set of criteria upon which to review each of the proposed LNG import terminal and pipeline projects currently proposed in the region (which would include other projects on the Columbia River and in Coos Bay), the State can not determine whether the Bradwood Landing LNG import terminal and pipeline represents a superior site for such a facility from an economic, environmental and social perspective. As was suggested in Oregon's March 3, 2006 letter:

SA1-1 See our response to comment FA4-1.

SA1-2 Section 1.1 presents a summary of project purpose and need, including some information about regional markets. However, market issues and the need for this project would be more fully developed in the Commission's Order.

SA1-3 We disagree. The EIS provides our reasons for finding some alternatives to not be feasible. The project objectives, and the criteria we used to evaluate alternatives, are clearly explained at the beginning of section 3.1. Further criteria we used to consider alternative LNG terminal locations are outlined in section 3.1.5.3. See our response to EPA (comment FA3-14). The State of Oregon does not have the authority to determine a superior site for such a facility. The FERC has sole authority to site onshore LNG import terminals under the NGA and EPCA 2005. We do not choose between alternative locations, but evaluate each proposal on its individual merits. See also our responses to comments PM2-23, PM2-27, PM2-29 and PM2-31.

K-432

SA1-3 cont'd	<p>The alternatives analysis should include evidence and findings to support conclusions. At this point the resource report includes conclusory statements without clear findings that link evidence to applicable local, state and federal requirements. We recommend that the alternatives analysis be based on relatively clear standards. Objective standards tied to regulatory requirements and commonly recognized LNG import terminal needs are more useful than subjective or general standards.</p> <p>The DEIS continues to treat the need and alternatives analysis in a superficial manner.</p> <p>Geologic Site Stability</p>
SA1-4	<p>The DEIS should accurately reflect the content of geotechnical reports. Our review found several instances of incorrect technical statements and statements with no substantiating science in the DEIS. The DEIS should be reviewed by the contracted geotechnical authors to ensure proper incorporation of vital technical geological and engineering information and data. The contracted geotechnical reports should be reviewed by independent, qualified licensed or registered professionals. If this has been done then those reviews should be referenced and made available in appendices.</p>
SA1-5	<p>The DEIS did not adequately address mitigation of natural hazards including but not limited to:</p> <ul style="list-style-type: none"> • Adequate tsunami wave modeling • Liquefaction and ground stability • Landslide and debris flow characterization • Flooding
SA1-6	<p>In addition, there is no discussion of monitoring programs to accompany the operation of the facility. At the very least we recommend the facility emplace shoreline erosion monitoring.</p> <p>Fish Habitat Impacts</p>
SA1-7	<p>The DEIS does not include information on the amount of shallow-water fish habitat (habitat 20 feet in depth or less) that would be affected by the wharf structure, concrete berm, water intake etc. These impacts to shallow-water feeding and rearing habitat favored by juvenile salmonids such as chum, Coho and Chinook salmon need to be specifically defined and delineated.</p>
SA1-8	<p>The DEIS does not address how much shallow-water habitat may be adversely affected in areas below the dredging sites in the Clifton Channel. Quantifying the loss of shallow-water habitat from changes in hydraulic characteristics of the channel needs to take place and the number of juvenile salmonids affected by this loss of habitat should be estimated to determine appropriate compensatory mitigation. The anticipated reduction in the hydraulic characteristics, due to dredging 700,000 cubic yards of sediment to create turning basins, also suggests a likely reduction in juvenile salmonid shallow-water habitat and possibly an increase in habitat for predators like pikeminnow and bass.</p>
SA1-9	<p>Since initial dredging of the proposed turning basin and ship berth will remove approximately 45 acres of deep water (deeper than 20 feet) bottom habitat and maintenance dredging may need to</p>

State Agencies

1

- SA1-4 The EIS is a summary document that is written for a general audience and is not intended to be highly technical in nature. Technical reports (i.e., geotechnical reports, geohazard reports, seismic hazard analysis reports) prepared by qualified engineers and geologists have been provided to ODE and DOGAMI and are available to the public in the FERC's eLibrary. This document is available for viewing by the public on the FERC's internet web page at www.ferc.gov, through the eLibrary link, selecting "General Search," entering the docket number minus the last three digits (i.e., CP06-365), and putting in the proper date range. This information has been reviewed by the FERC staff and its third-party contractor, including licensed professional geologists and engineers. The reports have also been reviewed by the FERC's consulting seismic design and geotechnical engineers.

These reports assess the site-specific earthquake probabilities, the geotechnical site conditions, and the site-specific effects of earthquake shaking on the proposed facility as required by NFPA 59A, and as further detailed in FERC's Seismic Design Guidelines (Jan. 2007).

The work performed to date is sufficient to characterize the major geological aspects of the site and to understand the significant geotechnical issues that must be addressed in the later, more detailed, design phase of the project. The facility must be designed to withstand a major CSZ earthquake, without loss of the storage tank contents as required by NFPA 59A. There is a high probability that underlying soils at the site, if unmodified, would liquefy during a significant earthquake and that vertical settlement and several feet of lateral spreading towards the river would occur. Proposed mitigation measures (including deep pile foundations and soil densification through vibroflotation) are included to minimize the liquefaction potential and large displacements.

Through the FERC Staff's Recommended Certificate Conditions, NorthernStar would be required to provide additional design details prior to initial site preparation and to demonstrate that the proposed site improvements achieved the necessary subgrade conditions prior to receiving approval to construct the remainder of the facility. The FERC Staff also recommends that NorthernStar be required to retain the services of an independent Board of Consultants, that would review and certify that all civil and structural detailed design calculations and construction documents are in compliance with all applicable codes, standards and project civil and structural design criteria, that all civil and structural construction is in conformance with the project construction documents, that all procured equipment has been properly seismic qualified in conformance with the project seismic qualification requirements, and that seismic detailing of structures has been properly implemented.

State Agencies

1

- SA1-5 These topics are addressed in responses to comments appearing later in this comment letter.
- SA1-6 See our response to comment SA1-96.
- SA1-7 Section 4.5.2.1 has been revised to quantify direct impacts on shallow water habitats.
- SA1-8 Section 4.5.2.1 has been revised to quantify direct impacts on shallow water. Potential impacts on wetlands and wildlife due to construction and operation of the LNG terminal are described in sections 4.4.1.2 and 4.5.2. See also our response to comment FA2-11.
- SA1-9 The rationale for the predicted frequency of maintenance dredging is included in the Hydrodynamic and Sediment Transport Assessment that was conducted for the Bradwood Landing Project. This document was filed with the FERC as part of its Application on June 5, 2006. This document is available for viewing by the public on the FERC's internet web page at www.ferc.gov, through the eLibrary link, selecting "General Search," entering the docket number minus the last three digits (i.e. CP06-365), and putting in the proper date range. We agree that impacts on the berth and maneuvering area would be permanent, as is presented in both table 2.3-1 and in section 4.5.2.1.

- SA1-9 | occur every two years, and benthic communities that salmonids depend on for food may take as long as two to three years to recolonize (DEIS, page 4-135), the habitat in question should be considered permanently lost and not temporarily disturbed (Appendix G, page 103).
- SA1-10 | There are no estimates in the DEIS on the number of juvenile salmonids that rear in areas that would be affected by construction of the wharf structure, pilings, shoreline concrete berm, water intakes, etc. FERC did estimates of potential juvenile salmonid usage around those areas they suggested as mitigation sites (Svensen Island) (Appendix G, page 41), but not of areas to be disturbed by the activities proposed in the shallow-water fish habitat area. In order to make a fair comparison or assessment of the value of habitat around Svensen Island to that of Clifton Channel, sampling results from juvenile seining completed in the Clifton Channel or estimates of salmonid usage should be included in the DEIS.
- SA1-11 | FERC states that by restoring/enhancing habitat at Svensen Island, they will more than meet their mitigation requirement (DEIS, page 4-143, Appendix G, page 104). FERC suggests that by restoring and or enhancing a total of approximately 235 acres at lower and middle Svensen Island they would be meeting the compensatory mitigation requirement of three acres enhanced for every acre lost. Considering that the down-stream Clifton Channel shallow-water habitat lost from effects of the creation of the turning basin has not yet been determined, it is not possible to determine the adequacy of the proposed mitigation.
- SA1-12 | When discussing compensatory mitigation for loss of habitat, FERC needs to make a distinction between what they intend to restore and what they intend to enhance. If their intention is to restore habitat then the ratio of one acre restored for every acre lost needs to be applied. If enhancement is their intention, then the ratio of three acres enhanced for every acre lost would be the goal.
- SA1-13 | Within the Wildlife and Aquatic Resources section of the DEIS, the fish screening provisions for the LNG ships do not provide adequate detail. This section does state that the ships would be provided with filtered water however, there is no mention of "fish screens." There also is no mention that the screens for the ships will be designed to meet National Marine Fishery Service (NMFS) or Oregon Department of Fish and Wildlife (ODFW) fish screen criteria, or that NMFS and ODFW will review and approve screen designs. Fish screens for the ship ballast and cooling water intakes as well as for all other surface water uses must meet NMFS and ODFW standards. Oregon recommends that a condition be added to the final EIS stating that the screens for ship cooling and ballast water will meet NMFS fish screening criteria and the design will be approved by NMFS and reviewed by ODFW prior to installation. Oregon also recommends that a testing system be included as a condition in the final EIS to ensure that the screens work properly since this is an as-of-yet unproven screening system. Oregon believes that screening the ships' cooling and ballast water intakes on the wharf may be the best solution.
- SA1-14 | Oregon also requests that the Commission include a condition that allows Oregon to review, comment on and approve all design-level detail for fish screens for all surface water uses for the terminal site, ships and pipeline in Oregon. Screening of water intakes includes water use for the LNG ships' cooling and ballast water, hydrostatic testing of LNG tanks and pipelines, soil compaction and ground improvements, and the fire suppression system. Screening is also addressed specifically for the dam and pump method for pipeline water body crossings. If any

State Agencies

1

- SA1-10 | Additional information has been provided in section 4.6 estimating the numbers of juvenile salmonids that rear in the vicinity of the LNG terminal site.
- SA1-11 | See our response to comment FA2-10.
- SA1-12 | Section 2.1.5 has been revised to clarify that the Hunt Creek Mitigation Site would be preserved; the lower Svensen Island Mitigation Site would be preserved and limited enhancement activities would be implemented by NorthernStar; and the middle Svensen Island, Delameter Creek, and Petersen Point Mitigation Sites would be restored as compensatory mitigation for unavoidable impacts associated with the Bradwood Landing Project.
- SA1-13 | See our response to comments PM1-31 and FA1-28.
- The FERC staff's recommendation in section 4.5.2.1 that NorthernStar conduct post-installation water flow mapping through all intake screens at the LNG terminal would provide adequate testing of the system. In addition, we have recommended that NorthernStar consult with the NMFS and ODFW to develop a monitoring program that would assess the effects of impingement and entrainment from use of the screened water supply system on juvenile salmonids during terminal operations.
- SA1-14 | As stated in section 2.1.3.6, all fixed intakes at the proposed LNG terminal that withdraw water from the Columbia River would be screened. In addition, as described in section 4.2.3 of the Waterbody and Wetland Construction and Mitigation Procedures Plan, screens would be installed on pump suction hoses to prevent the entrainment of aquatic species in waterbodies crossed using the dam and pump method.
- Because all intake screen designs have been reviewed and approved by the NMFS and comply with ODFW and NMFS regulations and fish design criteria, we do not feel that it is necessary to include a condition in the EIS that would require NorthernStar to submit all design-level detail for fish screens to the State of Oregon for review, comment, and approval.

SA1-14 | fish salvage operations that require pumping occur during pipeline construction, the pump intake should be screened.

cont'd

Environmental Impacts

SA1-15 | The federal agencies, including FERC, have little experience with siting this type facility in the Northwest. The few other LNG facilities that exist on the East Coast and Gulf Coast are in completely different environmental scenarios. Review and evaluation of such a project in the Northwest is complicated by the proposed location of this project far up within the riverine system (39 miles from the ocean) in a dynamic portion of the Columbia River estuary, in addition to the many endangered species listings, impaired status of the Columbia River, and lack of detailed information on cumulative impacts from activities in Oregon, Washington and Canada, which contribute to the River's listings and impairment.

The Lower Columbia River Estuary is one of 27 estuaries in the Environmental Protection Agency's (EPA) National Estuary Program and the Columbia River has recently been named by EPA a Nation's Great Water Body (one of seven in the country) and elevated to a national priority for addressing watershed health. EPA's two pronged focus for this priority is to address toxics and wetland loss. Impacts on the river environment that are contrary to these goals must be scrutinized and justified by projects that provide significant national gains to offset the regional impacts.

The West Coast Governor's Agreement on Ocean Health Draft Action Plan lists several goals related to water quality and its beneficial uses which may conflict with the proposed Bradwood Landing project. These include:

- SA1-16 | • "Restore estuarine habitats, including coastal wetlands, to achieve a net increase in habitat and their function by at least ten percent over the next ten years." – The Bradwood Landing project proposes enhancement of existing wetlands and habitat, yet there would be a net loss in the estuary of up to 58 acres of in-stream habitat and 33 acres of wetlands, as well as temporal losses from temporary impacts to 98 acres of wetlands.
- SA1-17 | • "Make Low Impact Development (LID) a priority for the West Coast." – The impacts of the proposed Bradwood Landing project are high, and no analysis or planning has gone toward applying LID techniques to manage polluted runoff, limit imperviousness or new surfaces, or reduce other impacts.
- SA1-18 | • "Urge the International Maritime Organization to adopt the U.S. proposal which sets stringent emission standards for ocean going vessels." – The proposed Bradwood Landing project would increase ocean going vessel traffic and associated emissions.
- SA1-19 | • "Develop regional sediment management plans to maximize beneficial use of sediments (i.e., sand) to protect and maintain critical community economic and environmental infrastructure." – Regional sediment management strategies should be in place to require the best re-use of material, limit the amount removed from the system, and protect downstream communities from having to deal with toxics.

State Agencies

1

SA1-15 | We disagree. The FERC has a great deal of experience in the siting of LNG import terminals throughout the United States, and the regulation of jurisdictional LNG storage "peak shaving" plants, as the FERC is the lead federal agency authorizing onshore LNG import terminals. The FERC and other federal agencies with regulatory roles have reviewed many natural gas and hydroelectric projects in the Pacific Northwest. While this experience has been relied upon for preparing the EIS for this project, the FERC has also solicited and incorporated input from other agencies, various stakeholder groups and any member of the public interested in these proceedings.

SA1-16 | We agree that the Bradwood Landing Project would result in both temporary and permanent impacts on wetlands within the Columbia River estuary. Although compensatory mitigation is not required for temporary wetland impacts, temporary impacts would be mitigated through the implementation of NorthernStar's Waterbody and Wetland Construction and Mitigation Procedures Plan. Because the plan has not been finalized, we have recommended in section 4.3.2.4 that NorthernStar continue to consult with the COE, NMFS, FWS, and other appropriate federal and state agencies to finalize its Waterbody and Wetland Construction and Mitigation Procedures Plan. Permanent impacts on wetlands would be mitigated by restoring and preserving habitat with similar ecological function in the general project area. NorthernStar's stated intention is to provide mitigation in areas substantially larger than that lost to permanent impacts, and restore such areas to a higher level of ecosystem function. Because NorthernStar is currently revising its Compensatory Mitigation Plan, we have recommended in section 4.4.1.2 that NorthernStar continue to consult with the COE, FWS, NMFS, ODSL, WDE, and other appropriate resource agencies to finalize its Compensatory Mitigation Plan, prior to construction of the LNG terminal and pipeline facilities.

SA1-17 | Consistency with existing land use plans, policies, designations, and guidelines is discussed in section 4.7.2.2. Management of run-off and impervious materials is discussed in section 4.3.2.3.

SA1-18 | Emissions and a discussion of air quality impacts resulting from the ocean going vessel traffic associated with the proposed project have been included in section 4.10.1 of the final EIS.

SA1-19 | NorthernStar has proposed to place sediments dredged from the maneuvering basin at the Wahkiakum County Sand Pit site for beach replenishment. The Bradwood Landing Project would not subject downstream communities to toxics.

- SA1-20 • "Aquatic invasive species are considered one of the greatest threats to native species and habitats. The introduction of aquatic invasive species into West Coast waters threatens the ecological, social, public health, and economic integrity of the region's marine resources." –The Bradwood Landing project does not propose adequate measures to prevent the transport of invasive species on the LNG ships that would enter the Lower Columbia estuary.

Emergency Preparedness Planning

- SA1-21 The DEIS is predicated on the assumption that critical response assets are already approved and in place. This is a major flaw in the draft emergency response plan (ERP) for the proposed Bradwood Landing LNG terminal. Without commitment to provide this region the necessary resources, Oregon is unable to conduct a thorough evaluation of Bradwood Landing's draft ERP to ensure the plan is adequate and can be effectively implemented to protect the health and safety of Oregonians in the event of an LNG mishap at Bradwood or in transit to and from the importation terminal. Commitments made outside the NEPA process must be incorporated into the FEIS to assure that needed communication and emergency response infrastructure are approved and placed into service prior to facility operations.

Emission Offset/Facility Retirement

- SA1-22 The DEIS does not contain mitigation recommendations requiring Northern Star to offset CO₂ emissions and to provide financial assurance to retire the facility, both of which are required by Oregon's Energy Facility Siting Standards. The FEIS should contain a detailed engineering estimate of future site retirement costs and assurances gained that those costs will be covered, before FERC issues a Final EIS. Without those assurances, Oregon has no protection against bankruptcy or abandonment of the facility. Additionally, the facility will add an undefined amount of carbon dioxide (CO₂) to the lower Columbia airshed. The amount of CO₂ to be emitted cannot be calculated without a final design, and this impact cannot be quantified. The FEIS should provide appropriate conditions for offsetting the potential emissions, followed by conditions to "true up" the calculations such that mitigation can be meaningfully implemented.

Economic Impacts

- SA1-23 Knowing the impact of this new natural gas source on the regional energy situation would be helpful in determining if the project will benefit industries in the Pacific Northwest and specifically Oregon.
- This project will bring in a new supply of natural gas to the region and country. This fact is not addressed in the DEIS. The project may have connections to PGE production facilities at Port Westward and to Georgia Pacific Wauna Mill. These connections could prove valuable to those facilities over time as energy costs escalate. This is not mentioned in the EIS but may have significant long term positive impacts for GP Wauna Mill and ratepayers served by PGE. This of course depends on the details of the contracts that will be executed by the companies involved.
- SA1-24 FERC has asserted that this project will increase the capacity of ship piloting and tug capacity on the river to the benefit of all shipping operations. New bar and river pilots and tugboats will be

State Agencies

1

- SA1-20 Additional information on the potential for the introduction of invasive species to the lower Columbia River through hull fouling has been added to section 4.5.1.1.
- SA1-21 See our response to comment PM1-1. As discussed in section 4.11.6, the ERP would need to be reviewed and approved by the FERC before any final approval to begin construction. The ERP must include a Cost Sharing Plan which must be approved by FERC before any final approval to begin construction. If the needed resources are not available and properly funded, construction and operation of the project would not be approved by the FERC.
- SA1-22 Section 4.10.1.2 of the final EIS has been updated to indicate that NorthernStar has agreed to voluntarily comply with the Oregon Department of Energy's siting requirements for non-generating energy facilities, including the CO₂ emission standards, for the proposed LNG import terminal.
- SA1-23 We have included in section 1.1 a discussion of the likely positive impacts of LNG on future natural gas prices.
- SA1-24 The EIS does discuss using additional tugs to assist with LNG marine traffic in the waterway. It also mentions that NorthernStar is considering using the existing PWRR to bring construction materials to the LNG terminal.

- SA1-24 | added as a result of this project. Additionally, it is projected that the project will generate increased rail traffic during construction and improve a portion of the rail through a required realignment at the project site.
- cont'd
- SA1-25 | It was estimated by Northern Star that based on current tax rates, property tax revenue for Clatsop County and special districts would increase by 92.4 percent upon completion of the LNG terminal and that construction jobs will average 331 per year over three years with an expected peak of 506. Northern Star has also committed to hiring at prevailing wages for all construction jobs. During operations the project is projected to generate 50 FTEs and will operate 24/7. Average salary at the terminal was estimated by the applicant at \$60,000/yr. based on prevailing wages. The project is also projected to require an additional 15 FTEs for security.

SPECIFIC COMMENTS ON DEIS

These comments follow the organization of the DEIS and include both comments on deficiencies in the evidentiary basis for the conclusions and specific recommendations for additional language or conditions. Recommendations for additional language or conditions are italicized. Oregon agencies whose comments are included here include Oregon Department of Energy (ODOE), Oregon Department of Environmental Quality (DEQ), Oregon Department of State Lands (DSL), Oregon Water Resources Department (WRD), Oregon Department of Forestry (ODF), Oregon Department of Fish and Wildlife (ODFW), Oregon Department of Geology and Mineral Industries (DOGAMI), Oregon Department of Land Conservation and Development and Oregon Coastal Management Program (DCLD/OCMP), Oregon Department of Economic & Community Development (ODECD), and Oregon Department of Transportation (ODOT)

- SA1-26 | **Executive Summary, pg 3, paragraph 4**
Forest vegetation. Planting in clearing right-of-way will minimize the amount of area converted to a non-forest condition
- SA1-27 | **Executive Summary, pg 6**
Ignition and combustion potential, fire hazards. There is no acknowledgment in the Executive Summary that wildfire could potentially result from LNG or gas leak in forested settings. An analysis of this possibility should be added to the document.
- SA1-28 | **Executive Summary, pg 7**
Pipelines. The Palomar pipeline is addressed under Section 2, "Proposed Action" but is not mentioned in the Executive Summary. Please add a discussion of Palomar and how it relates to the Bradwood project.
- SA1-29 | **Executive Summary, page 9, 8th bullet**
Fire. Add language that says Oregon Department of Forestry is an emergency responder to wildfire in non-urban forested settings

1.0 INTRODUCTION**Section 1.1 Purpose and Need (p. 1-3)**

State Agencies

1

- SA1-25 | Section 4.8 addresses socioeconomic impacts and benefits, including taxes that NorthernStar may pay to local jurisdictions.
- SA1-26 | See our response to comment SA3-9.
- SA1-27 | The Executive Summary is meant to be very brief and cannot discuss every topic that is covered in detail in the body of the EIS. Forest fires are discussed in section 4.0.
- SA1-28 | We only summarize the most important conclusions from our EIS in the executive summary.
- SA1-29 | The referenced bulleted items are taken from the Coast Guard's WSR, which does not include a discussion of the Oregon Department of Forestry or other specific resources relative to the need to augment shore side firefighting capabilities.

SA1-30 Purpose and Need is too general to be useful. The primary assertions are related to market demand and unsupported forecasts. Conclusions are based on assumptions that are not supported by evidence or analysis. DEIS should include information about regional or national energy infrastructure guidance or any planning to support a demonstrated need. Also, add an assessment of system capacity or potential to meet need through FERC approved projects that have not yet been constructed. More rigorous analysis is needed to support Purpose and Need conclusions.

Section 1.3.11 Other State Permits and Approvals (p. 1-11)

SA1-31 Paragraph 5 states "Any state or local permits issued with respect to jurisdictional facilities must be consistent with the conditions of any Certificate the FERC may issue." This statement is confusing because it is not clear how a certificate could even be issued if a state agency were to find that a needed resource was not available, or further use was prohibited or limited. This statement does not raise a particular issue at this time.

The FERC needs to consult with state agency experts prior to issuing any Certificate in order to preserve and protect valuable natural resources. The FERC cannot expect a state to make available resources in violation of its own rules and law. The State of Oregon has an established process under EFSEC that utilizes these agencies knowledge and expertise to site and certify energy projects. That process structure needs to be incorporated into the FERC siting process for LNG.

Sec 1.3.11, (p. 1-11)

SA1-32 State permits. All "forest operations" must comply with Forest Practices Act. Oregon Administrative Rules include notification of harvest, harvest plans, protection against wildfire, etc. (ODF)

Section 1.3.11, (p. 1-11 – 1-12)

SA1-33 State Approvals. Per ORS 509.585 and OAR 635-412-0020, fish passage approval from Oregon Department of Fish and Wildlife is required for stream crossings. The DEIS does not mention the need for approval by ODFW for pipeline crossings, potential lateral crossings, or other road crossings (e.g., Hunt Creek Bridge). Even though the pipeline will be placed beneath streams, it fully crosses them and has the potential to be an artificial obstruction if exposed through stream grade changes. The final EIS should include a condition requiring ODFW approval, prior to issuance of the Joint 404/Removal Fill permit, for all stream crossings. (ODFW)

Section 1.3.11, (p.1-12)

Removal-Fill Law Requirements. Required proprietary authorizations need to be indicated in the DEIS.

SA1-34 Add a more detailed justification on how the proposed project's purpose and need is the "best use of the water resources of this state" and within the public need.
Project will be reviewed per OAR141-085-0025, -0027, 0029, -0031, -0115 *et seq.* (mitigation) and ORS 196.825.

Per OAR 141-085-0029(3), "the Department must determine that the proposed removal-fill activity will not be inconsistent with the protection, conservation and best use of the water

State Agencies

1

SA1-30 We have revised our discussion of purpose and need in section 1.0.

SA1-31 See our responses to comments PM06-94 and FA2-22. Table 1.3-1 lists the major federal, state, and local codes; ordinances; statutes; rules; regulations; and permits that would apply to the project. The Bradwood Landing Project is not being reviewed or authorized by the EFSEC. Under the EAct 2005, the FERC has sole authority to site onshore LNG terminals, and we review applications according to our regulations.

SA1-32 The Forest Practices Act has been added to table 1.3-4.

SA1-33 Fish passage approval from ODFW for stream crossings has been added to table 1.3-4.

SA1-34 We have expanded the discussion of the project purpose and need in section 1.1.

State Agencies

SA1-34
cont'd resources of this state, and would not reasonably interfere with the paramount public policy of this state to preserve the use of its waters for navigation, fish and public recreation".
Removal-Permit permit will be contingent upon receiving all other local, state and federal authorizations and approvals.

Section 1.3.11, (p. 1-12) General Comments

SA1-35 Removal-Fill Law/Compensatory Mitigation Requirements. Compensatory mitigation is required for projects within both wetlands and waters of the state. Compensatory wetland mitigation (OAR141-085-0121, -0126, -0136, -0141, -0151), Compensatory mitigation (OAR141-085-0115) and mitigation for temporary impacts (OAR 141-085-0171) are needed.
Per OAR 141-085-0121 (4), for projects over 0.2 acres, on-site Compensatory wetland mitigation first has to be considered. Compensatory mitigation is also required for impacts to water resources per OAR 141-085-0115. There is not a clear compensatory mitigation plan for impacts from dredging or wharf construction activities that show an increase in function to offset impacts.
Complete compensatory wetland, compensatory non-wetland and temporary impacts mitigation plans are needed prior to issuing a Removal-Fill permit.

Section 1.4. Public Review and Comment, (p. 1-16)

SA1-36 Spill contingency planning. Need to add the State of Oregon requirement for preparation of vessel and facility spill contingency planning requirements. ORS 468B.300 *et seq.*, amended by 2007 Legislature, requires Oregon DEQ review and approval of LNG vessel and facility spill contingency plans.
Note that DEQ will need to amend existing spill contingency planning requirements to specify plan submittal requirements for LNG facilities and vessels. Plan approval is required prior to any delivery of LNG to Bradwood facility. (DEQ)

Section 2.0 DESCRIPTION OF PROPOSED ACTION

Section 2.1.1.5, Ballast and Cooling Water (p. 2-6)

SA1-37 With regard to obtaining water for ballast and cooling for LNG ships, Bradwood Landing has indicated its intent to apply for a water right for a fixed, on-shore or on-dock diversion system. If Bradwood does not apply for a water right for ballast and cooling, the state urges Bradwood to consult with OWRD in the near future to assure that water appropriation does not cause injury to existing uses or over-appropriation of the water resource. Wells appropriating ground water used for ballast and cooling must comply with OWRD's statutes and rules governing well construction. The state urges FERC to require a funding agreement for consultation with OWRD on water rights issues. (OWRD)

Section 2.1.1.7, Page 2-7

SA1-38 Fire Protection. Water used for actual firefighting is an exempt use of water and does not require a permit. Testing of firefighting systems does require a permit.
Add a statement that use of water for actual firefighting is an exempt use and a permit is not required, while testing of a firefighting system does require a permit, for which an application has already been submitted. This should be clarified prior to any FERC certification. (OWRD)

SA1-35 As described in section 2.1.5, NorthernStar is currently revising its Compensatory Mitigation Plan based on input from agencies and stakeholders through site visits in both Oregon and Washington and through comments on the draft EIS and other comment periods associated with permits required for the project. However, because the plan has not been finalized, we have recommended that NorthernStar continue to consult with the COE, NMFS, FWS, ODFW, ODSL, WDE, and other appropriate agencies to finalize its Compensatory Mitigation Plan. See also the response to comment FA2-10.

SA1-36 The spill response plan has been added to table 4.6.2-1 as a minimization measure.

SA1-37 Wells would not be used as a primary or alternative source of water for vessel ballast water or engine cooling water.

SA1-38 We revised the EIS.

Bradwood Landing Natural Gas Importation Terminal
Draft Environmental Impact Statement Comments

State of Oregon
Page 9

2.1.3.6 Railroad Relocation (p.2-25)

2.4.1.1 Railroad Line Realignment (p. 2-41)

SA1-39 Railroad Relocation description is not adequate. The document should provide information about the environmental effects of this project element. The description should address potential for impacts based on potential for resumed service. (DSL)

Section 2.1.3.1, Maneuvering Area and Berth (p.2-13)

Sections 2.4.1.2, 2.4.1.3, Maneuvering Area and Ship Berth (p. 2-42)

SA1-40 Total Project Impacts within Wetlands/Waters. Per OAR 141-085-0029(4 and 5), "the Department will issue the practicable alternative with the least adverse effects." Alternative site designs and layouts with a smaller footprint are not discussed in adequate detail as to why the chosen alternative layout is the most practicable with least adverse effects.

Need more discussion on "possible future expansion". Add language that indicates whether future expansion will include the avoided wetland area. (DSL)

Alternative wharf designs and footprints. (See additional discussion of alternatives within Compensatory Wetlands Mitigation (CWM) plan, Appendix G)

SA1-41 Lack of analysis as to why in-water disposal is not a "practicable alternative". Identify the sites for the maintenance dredging.

SA1-42 DSL recommends that project impacts listed within the Removal-Fill permit application provide more specific discussion as to how each element of the proposed project represents the practicable alternative with the least impacts to the aquatic resources.

Figures documenting impacts in waters should include total impacts area of wharf and pilings.

Sec. 2.1.6, Palomar Pipeline (p. 2-28)

SA1-43 Palomar pipeline is addressed under section 2, "proposed action" but not analyzed in section 4, so then it seems it must not be a part of the proposed action.

If the Palomar line is part of the proposed action as is suggested by its mention in section 2.0, then ODF would have a substantially greater level of concern and would expect a suite of issues related to State Forest lands be analyzed in section 4 of the DEIS. (ODF)

Section 2.3.3, Pipeline and Associated Aboveground Facilities (p. 2-35)

SA1-44 Permanent maintenance corridor. DEIS states that the corridor will be 50 feet wide, but on Page E-3 it says 30 feet, section 4.4.2 also says 30 feet. Please revise for consistency.

Section 2.4 Construction Procedures

SA1-45 Pipelines. If the Palomar line is listed under Section 2 as a proposed action, then its route and construction specifics should be addressed including the private and state forest ownership it would cross.

1. Dredging. No new moorages have been proposed in Oregon that approach the scale of impact for the proposed Bradwood Landing project. Under Clean Water Act 401 Certification, DEQ has not been asked to review a project with in-water and wetland impacts of this magnitude in the history of the 401 Certification Program. The project proposes a deepening by about -10 feet in shallow water habitat, over 58 acres in-water, adjacent to the 600 foot-wide federal navigation channel which is slated for deepening

SA1-39 We disagree. The EIS presents a more than adequate description of the proposed railroad relocation and an analysis of the potential environmental impacts associated with that action. See sections 2.1.3.6, 2.4.1.1, 4.3.2.3, and 4.8.2.7.

SA1-40 The proposed action is the site layout with the smallest footprint because a smaller footprint was not feasible. See also our response to FA2-14.

SA1-41 The disposal site for the material removed during maintenance dredging is uncertain at this time. The material would either go to the Wahkiakum County Sand Pit site, if a permit is obtained by Wahkiakum County, or to another approved disposal site.

SA1-42 We consider the proposed project, as modified by our recommended conditions, to be the preferred alternative. An analysis of alternatives is provided in section 3. ODSL is responsible for reviewing NorthernStar's removal and fill permit application on its own merits, under state regulations.

SA1-43 We agree that the description of the Palomar pipeline project should not have been placed under the proposed action. The discussion of the Palomar pipeline project has been moved from section 2.1.6 to section 3.1.2.2 and revised.

SA1-44 The EIS has been revised to reflect 50 feet as the permanent right-of-way corridor width.

SA1-45 See our response to comment SA1-43. Construction specifics including the private and state forest ownership crossed by the Palomar pipeline will be addressed in the EIS for the Palomar pipeline.

K-441

(from -40 feet to approximately -51 feet, including over dredge), as well as over 30 miles of new pipeline to connect at multiple delivery points with existing pipelines. Initial dredging of the turning basin and berth at this single river mile will remove approximately 700,000 cubic yards (cy), which is equal to about 1/1000 of the total volume projected for Columbia River channel deepening project over about 190 river miles and tributary mouths.

- SA1-46 a. Impacts from the combined actions of this dredging of 58 acres adjacent to the federal navigation channel and deepening of that channel have not been analyzed by the applicant. It is possible that dredging a large area adjacent to the channel will cause the channel to shift, and this needs to be thoroughly evaluated and addressed.
- SA1-47 i. Further, this project is dependent on channel deepening occurring at this location and being maintained at new depths indefinitely, although funding and renewed 401 Certifications (from Oregon and Washington) for the United States Army Corps of Engineers (Corps) to complete channel deepening and maintenance have not yet been issued.
- SA1-48 ii. Channel deepening studies by the Corps have analyzed side slope sloughing and bank erosion as a result of deepening. These impacts must be looked at in the context of the berth and turning basin dredging as well as in relation to channel deepening. Sediment transport models have been used by the applicant to look at some aspects of the proposal, but these models are not well understood, require subjective interpretation as to predictions, and may lead to conclusions contrary to those found by the Corps initiated modeling and studies.
- SA1-49 iii. Although in-stream sediments proposed for removal have been tested for contaminants, bank materials which may be eroded inadvertently have not been tested. No information is provided as to the historical and current pesticide and fertilizer applications in areas potentially susceptible to erosion and which have been exposed to agricultural or silvicultural practices. Inadequate analysis of bank stability during dynamic adjustment of the river to dredging could introduce bioavailable toxics to the water column and sediments that were previously tied up in upland material. Precaution in this regard is particularly important as data is scarce and implications are just beginning to be studied through the initiatives of EPA's and DEQ's toxics reduction goals in the high priority Columbia River system.
- SA1-50 iv. Additionally, stability of the former log pond at various stages of fill has not been analyzed with regard to dynamic changes to the river induced by dredging at the berth/turning basin and for channel deepening. Side slope sloughing in-stream caused by dredging could result in bank failure, which may release dredged sediment to fill the former log pond. The DEIS needs to thoroughly evaluate and address the impacts to the stream and habitat from a sudden release of up to 300,000 cy of sediment under this potential scenario.
- SA1-51 b. Impacts to the hydrodynamic geomorphic changes in the river, both upstream and downstream, have not been fully analyzed by the applicant. These may contribute

State Agencies

1

- SA1-46 Maintenance dredging of the navigation channel would maintain the channel position.
- SA1-47 The channel deepening project is being handled by the COE; it is not an activity regulated by the FERC.
- SA1-48 See our response to comment IND82-3.
- SA1-49 There is no indication of heavy pesticide or fertilizer use, such as would be typical of an agricultural setting, at the Bradwood site based on available historic information. Significant bank erosion at the LNG terminal is not anticipated; however, if it were to start occurring, mitigation measures would be required to stabilize the banks. Therefore, we do not believe that sampling and analysis of bank materials is warranted.
- SA1-50 The log pond is intended to be filled by sediment.
- SA1-51 See our responses to comments IND82-3, PM3-18, and IND82-5.

- SA1-51 cont'd
- SA1-52
- to unacceptable levels of erosion (banks on either side and around multiple in-stream islands), introduction of toxics to the waterway, habitat loss, and wetlands loss – all of which reduce water quality.
- c. DEQ does not have the technical capability to analyze fluvial geomorphic changes induced by the proposed project and how these will impact water quality. Initial review of the modeling presented raises questions about the appropriateness of the models used (e.g., why a 2-D model was used rather than a 3-D model which is available, lack of a physical basis for models used) and their predictive abilities given average results and highly complex relationships between erosion, sediment transport and deposition.
- i. This work must be contracted out by DEQ and management of the contractor coordinated internally by DEQ staff representing several programs to determine overall impacts on water quality.
 - ii. Additionally, there is no state or federal precedent to refer to for reviewing a project of this scale. DEQ will likely require the full time allowed for evaluation under the Clean Water Act for 401 water quality certification (365 days) of the proposed project.
2. Timing and Duration
- SA1-53
- a. Dredging is proposed to occur non-stop (24 hours per day, 7 days per week) for 2-3 months. No other proposal for dredging in the Columbia has operated 24-hours per day, 7 days per week for multiple months. Impacts to 13 listed salmonid species/ESUs, sturgeon (which are proposed for listing), resident aquatic organisms (mammals, fish, amphibians and reptiles, invertebrates, sediment dwellers), and terrestrial species are not fully identified or known based on non-stop action over this duration. Potentially debilitating impacts to these species include noise, continuous light, suspension of sediment, turbidity, loss of salmonid habitat and ability to rest or avoid predation, and potential attractant for sturgeon to a dangerous construction zone.
- SA1-54
- b. Pile driving and other in-water activities (with similar impacts as dredging) may occur simultaneously with dredging, dredge disposal, and upland construction. The cumulative effects of these actions on water quality “beneficial uses” (particularly listed salmonids, which are the most sensitive beneficial use) have not been analyzed or accounted for.
- SA1-55
3. Disposal of dredged material. The project proposes to dispose of dredged material either nearshore, in-stream, or use the material as fill on the terminal site, both after dewatering the materials back into the Columbia River. This discharge of return water to the Columbia may create high levels of suspended solids and turbidity in violation of water quality standards. In addition, accomplishing dewatering for use as fill on-site is proposed at the expense of the existing former log pond, which is currently connected to the mainstem Columbia and functions as a wetland and off-channel habitat for fish. Nearshore placement of dredged materials on Puget Island is at a currently eroding site. No analysis is offered as to erosion acceleration at this location due to the dynamic adjustment of the river in response to dredging. This may lead to a perpetual disturbance of the area during cycles of continual placement and erosion, as well as uncertainty of the fate of eroding material. It is possible that material will be deposited in the navigation

State Agencies

1

- SA1-52
- The EIS discuss studies undertaken to assess water quality and channel flow as a result of the dredging to create the turning basin at the Bradwood Landing terminal.
- SA1-53
- Potential impacts on aquatic resources and federally listed salmonids due to dredging are discussed in sections 4.5.2.1 and 4.6.2.2, respectively.
- SA1-54
- Dredging would not occur concurrently with other in-water activities associated with construction of the LNG terminal. Depending on the construction schedule, some in-water activities may occur simultaneously with upland construction activities at the LNG terminal site; however, NorthernStar would implement BMPs to protect water quality. Therefore, the additive impacts of these activities on water quality are expected to be short term and minor. Impacts of in-water construction activities on aquatic species are discussed in more detail in section 4.5.2.1. Impacts on listed salmonids in particular are discussed in detail in section 4.6.2. We are currently revising our BA and EFH Assessment in compliance with section 7 of the ESA and have recommended that NorthernStar not begin construction until formal consultation with the NMFS is completed.
- SA1-55
- As described in section 4.3.2.3, water removed from the dredged material is expected to infiltrate into the ground. During rain events, the decant would be routed to a holding pond. Compensatory mitigation is proposed for the unavoidable loss of the log pond. NorthernStar completed a modeling study of the impacts of dredging. These results are summarized in section 4.2.2.2.

State of Oregon
Page 12

SA1-55
cont'd

channel, resulting in an increased need for maintenance dredging, and these issues need to be thoroughly analyzed and addressed.

SA1-56

4. On-going maintenance dredging. Continual disturbance of the area will occur for the life of the LNG facility, every 2-4 years to maintain adequate depth by removing approximately 80,000 cy and disposing the material at Puget Island, which may be continually eroding due to the dredging. Another comparison of scope of this project is Oregon's largest port facilities at the Port of Portland: The Port of Portland maintains five berth areas at Terminal 6 on the Columbia River at the confluence with the Willamette River (a much larger system than the Clifton Channel where Bradwood is proposed); all five Port of Portland T-6 berths span about 1.5 river miles, are dredged to approximately -51 ft and require removal of only about 2,000 cy to 40,000 cy for maintenance on a similar time frame as the proposed Bradwood Landing project, which is projected to require approximately 80,000 cy removal.

SA1-57

5. Proposed equipment may be inadequate. All dredging is proposed to be accomplished via hydraulic suction. However, 12 of 31 cores planned for sediment sampling to depth (-43 ft) hit refusal before reaching proposed depth. The contractor's assumption was that obstructions were caused by dense gravel layers, wood and densely packed sand comprising an identified layer of consolidated sediments. No information is offered as to the ability of the proposed hydraulic equipment to penetrate the consolidated materials. Procedures proposed by the Corps for removing obstructions in channel deepening include using a clam shell bucket and blasting. Both of these methods may result in significantly deeper disturbance and greater impact to remove erratic materials. Further analysis and justification is required for such contingency measures. (DEQ)

SA1-58

Section 2.4.1.1, Site Preparation (p. 2-41)

Blasting. No statement is included that the applicant and the construction contractor will be aware of sensitive wildlife sites located near blasting. ODFW recommends that the applicant and the applicant's consultants/contractors consult with ODFW, prior to blasting, regarding sensitive wildlife site locations and timing of blasting in order to minimize impacts to sensitive wildlife. (ODFW)

Section 2.4.1.4, (p. 2-43)

Hydraulic Testing of the LNG Storage Tanks. Water Resources discusses its issues with use of water for testing in Sections 4 and 5. (OWRD)

Section 2.4.1.4, (p. 2-44)

Hydraulic/Pneumatic testing of Piping Systems. Water Resources discusses its issues with use of water for testing in Sections 4 and 5. (OWRD)

Section 2.4.2.1, (p. 2-47)

General Pipeline Construction Techniques, Hydrostatic Testing. Water Resources discusses its issues with use of water for testing in Sections 4 and 5. (OWRD)

SA1-59

Section 2.4.2.1, page 2-44

General Pipeline Construction Techniques. No statement is included that construction will occur after review of sensitive wildlife sites. ODFW recommends that the applicant and consultants

SA1-56

The EIS discusses maintenance dredging anticipated during operation of the Bradwood Landing LNG import terminal.

SA1-57

Hydraulic suction dredging would be adequate for removing consolidated sediments identified during sediment sampling by core refusal. The vibracore sampler, which met refusal, is not very robust. The other sampler that was used for the project did not have difficulty penetrating any of the sediments.

SA1-58

Section 4.5.2.3 has been revised to include a recommendation that NorthernStar consult with the NMFS, FWS, ODFW, and other appropriate agencies in developing its Blasting Management Plan.

SA1-59

Based on the analysis provided in the EIS, we believe that with the implementation of our recommendations, impacts on sensitive wildlife sites in the vicinity of the proposed project would be temporary and minor. In addition, potential impacts on federally listed species will be analyzed in detail during formal consultation with the NMFS and FWS. Therefore, we do not believe that additional consultation between NorthernStar and the ODFW regarding potential impacts on sensitive wildlife sites is warranted.

consult with ODFW on sensitive wildlife sites near the Liquefied Natural Gas (LNG) terminal and pipeline. (ODFW)

Section 2.4.2.2, Special Pipeline Construction Techniques (p. 2-49)

Section 4.4.1-3, Pipeline Facilities (pp. 4-98 - 4-105)

SA1-60 **Temporary Impacts.** Conversion of wetlands is not a temporary impact, i.e. Palustrine Forested wetland converted to Palustrine Emergent.

If there is a conversion of wetland types, this is a permanent wetland impact and Compensatory Wetlands Mitigation is needed. Clear explanation if the conversion of 5.0 acres of Palustrine Forested wetland is accounted for within the Compensatory Wetlands Mitigation plan. (Proposed temporary impacts at terminal is 15 acres).

Oregon has recommend that adequate CWM be identified. If Palustrine Forested wetland is being converted, the mitigation needs to be "in-kind" replacement. More detail is needed on what the width of the maintained right-of-way will be along pipeline. This is not clear if it will be 10 feet for all wetland crossings.

Authorization will be conditioned to require pipeline right-of-way restoration activities for the temporary impacts to wetlands be monitored for at least five years.

Finalized and complete Compensatory Wetlands Mitigation and Compensatory Mitigation Plans are required prior to any authorization from DSL. (DSL)

Section 2.4.2.2, Special Pipeline Construction Techniques (p. 2-53)

K-445 SA1-61 **Roads and Railroads.** Five foot depth is insufficient along or under any State Highway, or for any pipes within the Potential Impact Radius. ODOT needs a minimum of 10 foot depth below bottom of ditch or below surface grade to protect the integrity of the State Highway System.

ODOT has the responsibility to preserve the operational safety, integrity, and function of the highway facility. ODOT must also ensure that improvements to the highway system can be accomplished without undue impacts or damage to utilities within the highway right-of-way.

The developer must obtain a permit from ODOT to work within the highway right-of-way. The developer shall meet the requirements in Oregon Administrative Rule 734 Division 55 through special provisions.

The following conditions must be fulfilled before a permit to work in ODOT right-of-way will be issued.

- Developer must notify and work directly with ODOT where the proposed location of the pipeline is shown to be within the Potential Impact Radius (PIR) of any state highway. The PIR is based on minimum federal safety standards found in 49 CFR Part 192.
- Developer shall provide ODOT with a set of plans which include, but not limited to, detailed pipeline route maps and construction staging plans. Developer will work with ODOT to develop design standards for all pipes within the PIR of a state highway. Design requirements include the following:
- Minimum of 10 feet of cover from the top of the pipe will be the norm unless special acceptance of a lesser amount is authorized for a specific reason. A minimum of 10 feet of cover should be used as the standard within ODOT right-of-way.
- All pipeline crossings of the highway shall be properly cased or for uncased pipeline crossings, a substantial increase in the pipeline design standards will be required
- In no instance shall the pipeline attach to or be suspended within highway bridge structures.

SA1-60 As stated in section 4.0, FERC considers resources requiring more than 3 years to recover from construction activities to be a long-term impact. Palustrine forested wetlands within temporarily impacted areas would return to their preconstruction condition during the life of the project (approximately 40 years); therefore, although impacts on palustrine forested wetlands are considered long term, they are not considered a permanent impact. Conversion of forested wetlands to emergent wetlands would be mitigated through the implementation of NorthernStar's Compensatory Mitigation Plan.

Section 4.4.1.3 discusses wetland monitoring along the right-of-way. In addition, we have recommended that NorthernStar consult with appropriate federal and state resource agencies to develop a Waterbody and Wetland Construction and Mitigation Procedures Plan that includes measures to appropriately monitor the success of revegetation.

Right-of-way widths that would be maintained within wetlands and uplands are described in detail in sections 4.4.1.3 and 4.4.2.3, respectively.

See also our response to comment SA1-16.

SA1-61 Table 1.3-1 lists the major federal, state, and local codes, ordinances, statutes, rules, regulations, and permits that would apply to the project. NorthernStar would apply for permits to cross state and county roadways and adhere to the conditions of these permits. Section 2.4.2.1 has been revised.

State Agencies

- Highway access to all pipeline surface structures and assemblies such as, but not limited to, gate valves and monitoring equipment, shall comply with Oregon Administrative Rule 734 Division 51. A preferred location for pipeline surface structures and assemblies is to be placed outside highway right-of-way.
- Annually, updated emergency contact information (names and phone numbers) shall be delivered to each District Manager in which the pipeline may affect highway operations and maintenance activities.

It is the sole responsibility of the developer to ensure that all required environmental statutes and codes are completely met. The developer is responsible to secure all state, federal and local permits and clearances as required under federal, state and local statutes or codes for all areas within ODOT right-of-way that are impacted by the development. (ODOT Region 2)

Section 2.4.2.2 . Special Pipeline Construction Techniques (pp. 2-49 – 2-51)
Waterbody Crossings, paragraph 2.

SA1-62

(1) In discussing the flume and pump methods for stream crossings, no mention of fish salvage actions or reference to a fish salvage plan is made. The dam and pump method would also require proper fish screening. Since there is a high likelihood that the pipeline crosses fish-bearing streams with the potential for stranding of fish, the DEIS needs to include a fish salvage plan, or identify where/if one is available.

SA1-63

(2) This section discusses cleaning and inspection of flume pipe for dirt, grease, oil, and other pollutants. Consideration needs to be given to inspection of flume and equipment for invasive mussels. It is unknown if invasive mussels are present in the water bodies that are crossed, however, they are present in the Youngs Bay watershed downstream. In light of unknown distribution, a proactive approach for control of invasive species should be taken. ODFW recommends that equipment and materials used in and moved between waterways be inspected and cleaned (i.e., power wash those portions in contact with stream substrate). This recommendation should be added either in this section or as a part of the Environmental Compliance Inspection section (2.6). (ODFW)

Section 2.4.2.2. (p. 2-55)

SA1-64

Blasting. No statement is included that the applicant and the construction contractor will be aware of sensitive wildlife sites located near blasting. ODFW recommends that the applicant and the applicant's consultants/contractors consult with ODFW on sensitive wildlife sites and incorporate impact minimization measures. (ODFW)

Section 2.7.3, Pipeline and Associated Aboveground Facilities (p. 2-59 – 2-60)

SA1-65

Maintenance of Pipeline. Per ORS 509.610, pipeline crossings must be maintained as approved. This section should mention that exposure of the pipeline in streams will be monitored and addressed as a potential maintenance need. (ODFW)

Sec. 2.8.2.2 Emergency Response Procedures

SA1-66

Emergency response plan. Plan should include coordination with ODF on wildfire issues. (ODF)

Sections 2.1.5, Wetland and Habitat Mitigation Sites; 2.2.3, Salmon Enhancement Initiative; 4.6.2, Impacts and Mitigation; and 5.2 FERC's Staff Recommended Mitigation)
Mitigation

- SA1-62 As described in section 4.2.3 of the Waterbody and Wetland Construction and Mitigation Procedures Plan, screens would be installed on pump suction hoses to prevent the entrainment of aquatic species in waterbodies crossed using the dam and pump method. NorthernStar filed its Work Area Isolation and Fish Salvage Plan for the Bradwood Landing pipeline as Appendix K of its JPA on November 22, 2006. This document is available for viewing by the public on the FERC's Internet web page at www.ferc.gov, through the eLibrary link, selecting "General Search," entering the docket number minus the last three digits (i.e., CP06-365), and putting in the proper date range.
- SA1-63 Section 4.5.3.1 has been revised to include a recommendation that NorthernStar's final Waterbody and Wetland Construction and Mitigation Procedures Plan include measures to prevent the spread of invasive species due to construction activities within waterbodies.
- SA1-64 See our response to comment SA1-58.
- SA1-65 The pipeline would be installed and maintained in accordance with DOT standards, as explained in section 4.11.9. Pipeline crossings of waterbodies are discussed in section 4.3.2.4.
- SA1-66 NorthernStar has filed a draft ERP. It will be revised after review by the FERC, and other appropriate federal, state, and local agencies.

State Agencies

1

- K-447
- SA1-67 1. The majority of mitigation proposed (for both in-water and wetlands impacts) will occur off-site at an existing island 14 miles downstream of the proposed Bradwood Landing project. On-site mitigation is proposed by preserving existing wetlands and riparian area at Hunt Creek. All mitigation proposed would preserve and enhance existing areas which already provide functional water quality and habitat benefits. Although the targeted areas may function better if mitigation actions are successful, the project will still result in a permanent loss of 33 acres of wetland and 58 acres of in-stream areas, as well as temporal losses from an additional 98 acres of temporary wetland impacts. Not only is this contrary to both the intent and requirements for mitigation to fulfill permit requirements under the Clean Water Act, but it is of additional significance under the recent EPA elevation of the Columbia River to a national priority. EPA's strategic targets are to protect and restore 13,000 acres of wetlands and 3,000 acres of upland habitat, clean up toxic sediments, and reduce toxics concentrations in the water column and in fish tissues.
- SA1-68 2. Proposed off-site mitigation is too distant and not representative of all the impacts of the proposed Bradwood Landing project. The DEIS is inconsistent in some analysis related to this point. For example, the applicant notes that the closest other development in the area (12 miles away) which may contribute to cumulative impacts is too far away to have an effect. Yet off-site mitigation for impacts of the project is proposed at an island 14 miles from the terminal site and up to 30+ miles from the pipeline impacts. This proposed mitigation would not compensate for impacts at the project site. Additionally, any water quality and habitat benefits will be isolated to an area downstream of the impacts and at the lowest point in the watershed. Impacts are proposed in uplands, forested wetlands, tidal wetlands, and in-stream, and these will have cascading impacts to water quality and species in all levels of the watershed. Mitigation is proposed at only one level and will not fully replace the lost functions over the diversity and wide variety of areas affected.
- SA1-69 3. Upland impacts – Associated with the pipeline and powerline corridors will be the permanent removal of mature trees aging 20-80 years old, as well as old growth stands and other vegetation. This could potentially contribute to reduced infiltration and additional erosion leading to water quality problems nearby. This is also contrary to EPA's strategic target to protect and restore 3,000 acres of upland habitat in the Columbia River basin. These significant impacts will not be mitigated along the corridors, nor will mature trees be replaced, resulting in spatial and temporal losses which have not been addressed.
- Other Water Impacts
- SA1-70 1. Groundwater – The applicant has provided extensive information as to the location and capacity of groundwater which would serve the intended industrial uses. However, no information is provided as to potential impacts to groundwater as a result of operation of the proposed facility. In order to insure that infiltration of sanitary waste and stormwater would not pollute groundwater, details on the depth to groundwater, aquifer type, and infiltration media are required. DEQ permits for on-site septic proposals must be obtained. Adequate treatment of stormwater to remove pollutants is required – infiltration through sand alone for a short distance to shallow groundwater is not adequate to insure that groundwater will not receive pollutants. Withdrawal of large amounts of groundwater (approximately 12 million gallons for construction and 1 million gallons

SA1-67 See our response to comment FA2-10.

SA1-68 Adequacy of the Compensatory Mitigation Plan is discussed in the response to comment FA2-10. Directions for accessing NorthernStar's Compensatory Mitigation Plan via the eLibrary can be found in the response to comment PM6-11.

The FERC staff does not feel that the EIS is inconsistent in differentiating what is considered a cumulative impact and what can be considered mitigation for project impacts. Cumulative impacts are defined as those impacts resulting from other projects that are constructed at or close to the same time. The distance from the project within which cumulative impacts may occur varies based on the environmental resource being considered. For example, as described in section 4.12, impacts on geology and soils from construction activities are highly localized; therefore, cumulative impacts on near-surface geology and soils would only occur if other projects are constructed in the immediate vicinity of the proposed project. In contrast, cumulative impacts on federally or state-listed species could result if other projects would affect the same species or their habitats; therefore, cumulative impacts could occur within a much larger area. Alternatively, the driving factor in selecting a site for mitigation is the ability of a given site to replace functions that would be lost due to the proposed project. NorthernStar's rationale for selecting the proposed mitigation sites is described in detail in its Preliminary Engineering Design Draft Mitigation Plan.

SA1-69 Potential impacts on water quality due to clearing of trees and vegetation are discussed in section 4.3.2.4. Although operation of the pipeline and power line would result in permanent impacts on 125.3 acres of upland vegetation, it is important to note that all upland areas would be revegetated as described in sections 4.4.2.2 and 4.2.2.3. Old-growth forest would not be cleared as a result of the Bradwood Landing Project.

SA1-70 Groundwater characteristics at the terminal site, impacts and mitigation of water discharged to the ground, and associated permits are discussed in section 4.3.1.3. Based on the characteristics of the aquifer in which the on-site well would be completed and its location, we do not believe the volumes of water proposed to be used during construction and operation would adversely impact the aquifer, Hunt Creek, or the Columbia River (see section 4.3.1.3).

annually) from below sand may result in subsidence, prohibit recharge of the Columbia River or Hunt Creek, overdraw a confined aquifer, or result in a cone of depression drawing potential pollutants into the groundwater or streams.

2. Oregon Water Resources Department (OWRD) licenses for water withdrawals from surface waters and groundwater – Though some licenses may have been applied for from OWRD (groundwater withdrawals for pipeline hydrostatic testing and terminal construction), it is unclear whether these have been or will be granted or if surface water withdrawals (75 million gallons for terminal construction and ongoing withdrawals for fire suppression system) have been applied for. Further, it is unclear how review of these withdrawals will be coordinated with the Oregon Department of Fish and Wildlife, DEQ and others as needed to evaluate impacts and integrate permit requirements (DEQ National Pollution Discharge Elimination System (NPDES) or Water Pollution Control Facility (WPCF) permits are needed for the discharge of water withdrawn) and TMDL considerations.

SA1-72

3. Post-Construction Stormwater Management Plan – The plan provided is inadequate. Although a conceptual plan is presented, critical details are not provided which are necessary to determine that pollutant removal will be accomplished to the maximum extent practicable such that reasonably expected pollutants (sediment, metals, hydrocarbons, nutrients, etc.) in runoff from all associated impervious surfaces will not be discharged to waters of the state. Lacking information includes specifications for proposed facilities such as size of ponds, dimensions (length, width, side slope, depth) of swales, vegetative components, filtration media, distance of overland flow through vegetation, gradient of flow-paths, and chronology of a train of treatment features which addresses each reasonably expected pollutant. Additionally, there are inconsistencies with the conceptual plan, including proposed infiltration of all stormwater runoff despite compaction of fill areas for seismic stability for the facility. Finally, merging conveyance of runoff with spill containment/catchment facilities is not permissible. Minimizing potential pollutants to stormwater through separate conveyance from potential industrial spills is considered a best management practice.

SA1-73

4. National Pollution Discharge Elimination System (NPDES) permits - A recent ruling by the 9th Circuit Court may be a critical factor in deciding whether or not DEQ can issue a NPDES permit for the proposed Bradwood Landing facility. The case is *Friends of Pinto Creek et al v. EPA et al*, 504 F3d 1007 (9th Cir. 2007) (filed October 4, 2007). In brief, the 9th Circuit vacated a permit that EPA issued to Carlot Copper Company because the permit allowed discharges of copper into Pinto Creek, which was already exceeding water quality standards for copper. EPA contended that partial remediation of a discharge from another facility would offset the pollution going into Pinto Creek. The court ruled that 1) compliance schedules designed to bring the segment into compliance must be established for existing dischargers before a new permit can be issued, and 2) "there is nothing in the Clean Water Act or the regulation that provides an exception for an offset when the waters remain impaired and the new source is discharging pollution into that impaired water."

For wastewater discharges from the Bradwood Landing facility, temperature will probably be the only issue. Columbia River TMDLs are already in place for dioxin and total dissolved gas, but TMDLs are still needed for temperature, arsenic, DDT, and

SA1-71

Table 1.3-1 lists the major federal, state, and local codes, ordinances, statutes, rules, regulations, and permits that would apply to the project. Coordination of permit review within state agencies is not relevant to the EIS.

SA1-72

NorthernStar's Stormwater Management Plan provides the requested detail and is available via the eLibrary as described in the response to comment PM1-4.

SA1-73

This case is for a different project.
